Preface

Hitherto men have constantly made up for themselves false conceptions about themselves, about what they are and what they ought to be. They have arranged their relationships according to their ideas of God, of normal man, etc. The phantoms of their brains have got out of their hands. They, the creators, have bowed down before their creations. Let us liberate them from the chimeras, the ideas, dogmas, imaginary beings under the yoke of which they are pining away. Let us revolt against the rule of thoughts. Let us teach men, says one, to exchange these imaginations for thoughts which correspond to the essence of man; says the second, to take up a critical attitude to them; says the third, to knock them out of their heads; and -- existing reality will collapse.

These innocent and childlike fancies are the kernel of the modern Young-Hegelian philosophy, which not only is received by the German public with horror and awe, but is announced by our philosophic heroes with the solemn consciousness of its cataclysmic dangerousness and criminal ruthlessness. The first volume of the present publication has the aim of uncloaking these sheep, who take themselves and are taken for wolves; of showing how their bleating merely imitates in a philosophic form the conceptions of the German middle class; how the boasting of these philosophic commentators only mirrors the wretchedness of the real conditions in Germany. It is its aim to debunk and discredit the philosophic struggle with the shadows of reality, which appeals to the dreamy and muddled German nation.

Once upon a time a valiant fellow had the idea that men were drowned in water only because they were possessed with the idea of gravity. If they were to knock this notion out of their heads, say by stating it to be a superstition, a religious concept, they would be sublimely proof against any danger from water. His whole life long he fought against the illusion of gravity, of whose harmful results all statistics brought him new and manifold evidence. This valiant fellow was the type of the new revolutionary philosophers in Germany.

Introduction To The Critique Of Political Economy

1. PRODUCTION IN GENERAL

The subject of our discussion is first of all material production by individuals as determined by society, naturally constitutes the starting point. The individual and isolated hunter or fisher who forms the starting point with Smith and Ricardo, belongs to the insipid illusions of the eighteenth century. They are Robinsonades which do not by any means represent, as students of the history of civilization imagine, a reaction against over-refinement and a return to a misunderstood natural life. They are no more based on such a naturalism than is Rosseau's "contrat social," which makes naturally independent individuals come in contact and have mutual intercourse by contract. They are the fiction and only the aesthetic fiction of the small and great Robinsonades. They are, moreover, the anticipation of "bourgeois society," which had been in course of development since the sixteenth century and made gigantic strides towards maturity in the eighteenth. In this society of free competition the individual appears free from the bonds of nature, etc., which in former epochs of history made him a part of a definite, limited human conglomeration. To the prophets of the eighteenth century, on whose shoulders Smith and Ricardo are still standing, this eighteenth-century individual, constituting the joint product of the dissolution of the feudal form of society and of the new forces of production which had developed since the sixteenth century, appears as an ideal whose existence belongs to the past; not as a result of history, but as its starting point.

Since that individual appeared to be in conformity with nature and [corresponded] to their conception of human nature, [he was regarded] not as a product of history, but of nature. This illusion has been characteristic of every new epoch in the past. Steuart, who, as an aristocrat, stood more firmly on historical ground, contrary to the spirit of the eighteenth century, escaped this simplicity of view. The further back we go into history, the more the individual and, therefore, the producing individual seems to depend on and constitute a part of a larger whole: at first it is, quite naturally, the family and the clan, which is but an enlarged family; later on, it is the community growing up in its different forms out of the clash and the amalgamation of clans. It is but in the eighteenth century, in "bourgeois society," that the different forms of social union confront the individual as a mere means to his private ends, as an outward necessity. But the period in which this view of the isolated individual becomes prevalent, is the very one in which the interrelations of society (general from this point of view) have reached the highest state of development. Man is in the most literal sense of the word azoonpolitikon, not only a social animal, but an animal which can develop into an individual only in society. Production by isolated individuals outside of society—something which might happen as an exception to a civilized man who by accident got into the wilderness and already dynamically possessed within himself the forces of society— is as great an absurdity as the idea of the development of language without individuals living together and talking to one another. We need not dwell on this any longer. It would not be necessary to touch upon this point at all, were not the vagary which had its justification and sense with the people of the eighteenth century transplanted In all earnest into the field of political economy by Bastiat, Carey, Proudhon and others. Proudhon and others naturally find it very pleasant, when they do not know the historical origin of a certain economic phenomenon, to give it a quasi historico-philosophical explanation by going into mythology. Adam or Prometheus bit upon the scheme cut and dried, whereupon it was adopted, etc. Nothing is more tediously dry than the dreaming locus communis. Whenever we speak, therefore, of production, we always have in mind production at a certain stage of social development, or production by social individuals. Hence, it might seem that in order to speak of production at all, we must either trace the historical process of development through its Various phases, or declare at the outset that we are dealing with a certain historical period, as, e.g., with modern capitalistic production which, as a matter of fact, constitutes the subject proper of this work. But all stages of production have certain landmarks in common, common purposes. Production in general is an abstraction, but it is a rational abstraction, in so far as it singles out and fixes the common features, thereby saving us repetition. Yet these general or common features discovered by comparison constitute something very complex, whose constituent elements have different destinations. Some of these elements belong to all epochs, others are common to a few. Some of them are common to the most modern as well as to the most ancient epochs. No production is conceivable without them; but while even the most completely developed languages have laws and conditions in common with the least developed ones, what is characteristic of their development are the points of departure from the general and common. The conditions which generally govern production must be differentiated in order that the essential points of difference be not lost sight of in view of the general uniformity which is due to the fact that the subject, mankind, and the object, nature, remain the same. The failure to remember this one fact is the source of all the wisdom of modern economists who are trying to prove the eternal nature and harmony of existing social conditions. Thus they say, e.g., that no production is possible without some instrument of production, let that instrument be only the hand; that none is possible without past accumulated labor, even if that labor consist of mere skill which has been accumulated and concentrated in the hand of the savage by repeated exercise. Capital is, among other things, also an instrument of production, also past impersonal labor. Hence capital is a universal, eternal natural phenomenon; which is true if we disregard the specific properties which turn an "instrument of production" and "stored-up labor" into capital. The entire history of production appears to a man like Carey, e.g., as a malicious perversion on the part of governments. If there is no production in general, there is also no general production. Production is always some special branch of production or an aggregate, as, e.g., agriculture, stock raising, manufactures, etc. But political economy is not technology. The connection between the general destinations of production at a given stage of social development and the particular forms of production, is to be developed elsewhere (later on). Finally, production is not only of a special kind. It is always a certain body politic, a social personality that is engaged on a larger or smaller aggregate of branches of production. The connection between the real process and its scientific presentation also falls outside of the scope of this treatise. [We must thus distinguish between] production in general, special branches of production and production as a whole.

It is the fashion with economists to open their works with a gen eral introduction, which is entitled "production" (see, e.g., John Stuart Mill) and deals with the general "requisites of production." This general introductory part treats or is supposed to treat: 1. Of the conditions without which production is impossible, i.e., of the most essential conditions of production. As a matter of fact, however, it dwindles down, as we shall see, to a few very simple definitions, which flatten out into shallow tautologies; 2. Of conditions which further production more or less, as, e.g., Adam Smith's [discussion of] a progressive and stagnant state of society. In ordeT to give scientific value to what serves with him as a mere summary, it would be necessary to study the degree of productivity by periods in the development of individual nations; such a study falls outside of the scope of the present subject, and in so far as it does belong here is to be brought out in connection with the discussion of competition, accumulation, etc. The commonly accepted view of the matter gives a general answer to the effect that an industrial nation is at the height of its production at the moment when it reaches its historical climax in all respects. Or, that certain races, climates, natural conditions, such as distance from the sea, fertility of the soil, etc., are more favorable to production than others. That again comes down to the tautology that the facility of creating wealth depends on the extent to which its elements are present both subjectively and objectively. As a matter of fact a nation is at its industrial height so long as its main object is not gain, but the process of gaining. In that respect the Yankees stand above the English. But all that is not what the economists are really after in the general introductory part. Their object is rather to represent production in contradistinction to distribution—see Mill, e.g.—as subject to eternal laws independent of history, and then to substitute bourgeois relations, in an underhand way, as immutable natural laws of society in abstracto. This is the more or less conscious aim of the entire proceeding. On the contrary, when it comes to distribution, mankind is supposed to have indulged in all sorts of arbitrary action. Quite apart from the fact that they violently break the ties which bind production and distribution together, so much must be clear from the outset: that, no matter bow greatly the systems of distribution may vary at different stages of society, it should be possible here, as in the case of production, to discover the common features and to confound and eliminate all historical differences in formulating general human laws. E.g., the slave, the serf, the wage-worker—all receive a quantity of food, which enables them to exist as slave, serf, and wageworker. The conqueror, the official, the landlord, the monk, or the levite, who respectively live on tribute, taxes, rent, alms, and the tithe, —all receive [a part] of the social product which is determined by laws different from those which determine the part received by the slave, etc. The two main points which all economists place under this head, are: first, property; second, the protection of the latter by the administration of justice, police, etc. The objections to these two points can be stated very briefly. 1. All production is appropriation of nature by the individual within and through a definite form of society. In that sense it is a tautology to say that property (appropriation) is a condition of production. But it becomes ridiculous, when from that one jumps at once to a definite form of property, e.g., private property (which implies, besides, as a prerequisite the existence of an opposite form, viz. absence of property). History points rather to common property (e.g., among the Hindoos, Slavs, ancient Celts, etc.) as the primitive form, which still plays an important part at a much later period as communal property. The question as to whether wealth grows more rapidly under this or that form of property, is not even raised here as yet. But that there can be no such a thing as production, nor, consequently, society, where property does not exist in any form, is a tautology. Appropriation which does not appropriate is a contradictio in subjecto. 2. Protection of property, etc. Reduced to their real meaning, these commonplaces express more than what their preachers know, namely, that every form of production creates its own legal relations, forms of government, etc. The crudity and the shortcomings of the conception lie in the tendency to see but an accidental reflective connection in what constitutes an organic union. The bourgeois economists have a vague notion that it is better to carry on production under the modem police, than it was, e.g., under club-law. They forget that club law is also law, and that the right of the stronger continues to exist in other forms even under their "government of law." When the social conditions corresponding to a certain stage of production are in a state of formation or disappearance, disturbances of production naturally arise, although differing in extent and effect. To sum up: all the stages of production have certain destinations in common, which we generalize in thought; but the so-called general conditions of all production are nothing but abstract conceptions which do not go to make up any real stage in the history of production.

2. THE GENERAL RELATION OF PRODUCTION TO DISTRIBUTION, EXCHANGE, AND CONSUMPTION

Before going into a further analysis of production, it is necessary to look at the various divisions which economists put side by side with it. The most shallow conception is as follows: By production, the members of society appropriate (produce and shape) the products of nature to human wants; distribution determines the proportion in which the individual participates in this production; exchange brings him the particular products into which he wishes to turn the quantity secured by him through distribution; finally, through consumption the products become objects of use and enjoyment, of individual appropriation. Production yields goods adopted to our needs; distribution distributes them according to social laws; exchange distributes further what has already been distributed, according to individual wants; finally, in consumption the product drops out of the social movement, becoming the direct object of the individual want which it serves and satisfies in use. Production thus appears as the starting point; consumption as the final end; and distribution and exchange as the middle; the latter has a double aspect, distribution being defined as a process carried on by society, while exchange, as one proceeding from the individual. In production the person is embodied in things, in [consumption] things are embodied in persons; in distribution, society assumes the part of go-between of production and consumption in the form of generally prevailing rules; in exchange this is accomplished by the accidental make-up of the individual. Distribution determines what proportion (quantity) of the products the individual is to receive; exchange determines the products in which the individual desires to receive his share allotted to him by distribution. Production, distribution, exchange, and consumption thus form a perfect connection, production standing for the general, distribution and exchange for the special, and consumption for the individual, in which all are joined together. To be sure this is a connection, but it does not go very deep. Production is determined [according to the economists] by universal natural laws, while distribution depends on social chance: distribution can, therefore, have a more or less stimulating effect on production: exchange lies between the two as a formal (?) social movement, and the final act of consumption which is considered not only as a final purpose, but also as a final aim, falls, properly, outside of the scope of economics, except in so far as it reacts on the starting point and causes the entire process to begin all over again. The opponents of the economists—whether economists themselves or not—who reproach them with tearing apart, like barbarians, what is an organic whole, either stand on common ground with them or are below them. Nothing is more common than the charge that the economists have been considering production as an end in itself, too much to the exclusion of everything else. The same has been said with regard to distribution. This accusation is itself based on the economic conception that distribution exists side by side with production as a self-contained, independent sphere. Or [they are accused] that the various factors are not treated by them in their connection as a whole. As though it were the text books that impress this separation upon life and not life upon the text books; and the subject at issue were a dialectic balancing of conceptions and not an analysis of real conditions. a. Production is at the same time also consumption. Twofold consumption, subjective and objective. The individual who develops his faculties in production, is also expending them, consuming them in the act of production, just as procreation is in its way a consumption of vital powers. In the second place, production is consumption of means of production which are used and used up and partly (as e.g., in burning) reduced to their natural elements. The same is true of the consumption of raw materials which do not remain in their natural form and state, being greatly absorbed in the process. The act of production is, therefore, in all its aspects an act of consumption as well. But this is admitted by economists. Production as directly identical with consumption, consumption as directly coincident with production, they call productive consumption. This identity of production and consumption finds its expression in Spinoza's proposition, Determinatio est negatio. But this definition of productive consumption is resorted to just for the purpose of distinguishing between consumption as identical with production and consumption proper, which is defined as its destructive counterpart. Let us then consider consumption proper. Consumption is directly also production, just as in nature the consumption of the elements and of chemical matter constitutes production of plants. It is clear, that in nutrition, e.g., which is but one form of consumption, man produces his own body; but it is equally true of every kind of consumption, which goes to produce the human being in one way or another. [It is] consumptive production. But, say the economists, this production which is identical with consumption, is a second production resulting from the destruction of the product of the first. In the first, the producer transforms himself into things; in the second, things are transformed into human beings. Consequently, this consumptive production—although constituting a direct unity of production and consumption—differs essentially from production proper. The direct unity in which production coincides with consumption and consumption with production, does not interfere with their direct duality. Production is thus at the same time consumption, and consumption is al the same time production. Each is directly its own counterpart. But at the same time an intermediary movement goes on between the two. Production furthers consumption by creating material for the latter which otherwise would lack its object. But consumption in its turn furthers production, by providing for the products the individual for whom they are products. The product receives its last finishing touches in consumption. A railroad on which no one rides, which is, consequently not used up, not consumed, is but a potential railroad, and not a real one. Without production, no consumption; but, on the other hand, without consumption, no production; since production would then be without a purpose. Consumption produces production in two ways. In the first place, in that the product first becomes a real product in consumption; e.g., a garment becomes a real garment only through the act of being worn; a dwelling which is not inhabited, is really no dwelling; consequently, a product as distinguished from a mere natural object, proves to be such, first becomes a product in consumption. Consumption gives the product the finishing touch by annihilating it, since a product is the [result] of production not only as the material embodiment of activity, but also as a mere object for the active subject. In the second place, consumption produces production by creating the necessity for new production, i.e., by providing the ideal, inward, impelling cause which constitutes the prerequisite of production. Consumption furnishes the impulse for production as well as its object, which plays in production the part of its guiding aim. It is clear that while production furnishes the material object of consumption, consumption provides the ideal object of production, as its image, its want, its impulse and its purpose. It furnishes the object of production in its subjective form. No wants, no production. But consumption reproduces the want. In its turn, production First, furnishes consumption with its material, its object. Consumption without an object is no consumption, hence production works in this direction by producing consumption. Second. But it is not only the object that production provides for consumption. It gives consumption its definite outline, its character, its finish. Just as consumption gives the product its finishing touch as a product, production puts the finishing touch on consumption. For the object is not simply an object in general, but a definite object, which is consumed in a certain definite manner prescribed in its turn by production. Hunger is hunger; but the hunger that is satisfied with cooked meat eaten with fork and knife is a different kind of hunger from the one that devours raw meat with the aid of hands nails, and teeth. Not only the object of consumption, but also the manner of consumption is produced by production; that is to say, consumption is created by production not only objectively, but also subjectively. Production thus creates the consumers. Third. Production not only supplies the want with material, but supplies the material with a want. When consumption emerges from its first stage of natural cmdeness and directness—and its continuation in that state would in itself be the result of a production still remaining in a state of natural crudeness—it is itself furthered by its object as a moving spring. The want of it which consumption experiences is created by its appreciation of the product. The object of art, as well as any other product, creates an artistic and beautyenjoying public. Production thus produces not only an object for the individual, but also an individual for the object. Production thus produces consumption: first, by furnishing the latter with material; second, by determining the manner of consumption; third, by creating in consumers a want for its products as objects of consumption. It thus produces the object, the manner, and the moving spring of consumption. In the same manner, consumption [creates] the disposition of the producer by setting (?) him up as an aim and by stimulating wants. The identity of consumption and production thus appears to be a threefold one. First, direct identity: production is consumption; consumption is production. Consumptive production. Productive consumption. Economists call both productive consumption, but make one distinction by calling the former reproduction, and the latter productive consumption. All inquiries into the former deal with productive and unproductive labor; those into the latter treat of productive and unproductive consumption. Second. Each appears as the means of the other and as being brought about by the other, which is expressed as their mutual interdependence; a relation, by virtue of which they appear as mutually connected and indispensable, yet remaining outside of each other. Production creates the material as the outward object of consumption; consumption creates the want as the inward object, the purpose of production. Without production, no consumption; without consumption, no production; this maxim figures (?) in political economy in many forms. Third. Production is not only directly consumption and consumption directly production; nor is production merely a means of consumption and consumption the purpose of production. In other words, not only does each furnish the other with its object; production, the material object of consumption; consumption, the ideal object of production. On the contrary, either one is not only directly the other, not (?) only a means of furthering the other, but while it is taking place, creates the other as such for itself (?). Consumption completes the act of production by giving the finishing touch to the product as such, by destroying the latter, by breaking up its independent material form; by bringing to a state of readiness, through the necessity of repetition, the disposition to produce developed in the first act of production; that is to say, it is not only the concluding act through which the product becomes a product, but also [the one] through which the producer becomes a producer. On the other hand, production produces consumption, by determining the manner of consumption, and further, by creating the incentive for consumption, the very ability to consume, in the form of want. This latter identity mentioned under point 3, is much discussed in political economy in connection with the treatment of the relations of demand and supply, of objects and wants, of natural wants and those created by society. Hence, it is the simplest matter with a Hegelian to treat production and consumption as identical. And this has been done not only by socialist writers of fiction but even by economists, e.g., Say; the latter maintained that if we consider a nation as a whole, or mankind in abstracto—her production is at the same time her consumption. Storch pointed out Say's error by calling attention to the fact that a nation does not entirely consume her product, but also creates means of production, fixed capital, etc. To consider society as a single individual is moreover a false mode of speculative reasoning. With an individual, production and consumption appear as different aspects of one act. The important point to be emphasized here is that if production and consumption be considered as activities of one individual or of separate individuals, they appear at any rate as aspects of one process in which production forms the actual starting point and is, therefore, the predominating factor. Consumption, as a natural necessity, as a want, constitutes an internal factor of productive activity, but the latter is the starting point of realization and, therefore, its predominating factor, the act into which the entire process resolves itself in the end. The individual produces a certain article and turns again into himself by consuming it; but he returns as a productive and a self-reproducing, individual. Consumption thus appears as a factor of production. In society, however, the relation, of the producer to his product, as soon as it is completed, is an outward one and the return of the product to the individual depends on his relations to other individuals. He does not take immediate possession of it. Nor does the direct appropriation of the product constitute his purpose, when he produces in society. Between the producer and the product distribution steps in, which determines by social laws his share in the world of products; that is to say, distribution steps in between production and consumption. Does distribution form an independent sphere standing side by side with and outside of production? b. Production and Distribution. In perusing the common treatises on economics one cannot help being struck with the fact that everything is treated there twice; e.g., under distribution, there figure rent, wages, interest, and profit; while under production we find land, labor, and capital as agents of production. As re gards capital, it is at once clear that it is counted twice: first, as an agent of production; second, as a source of income; as determining factors and definite forms of distribution, interest and profit figure as such also in production, since they are forms, in which capital increases and grows, and are consequently factors of its own production. Interest and profit, as forms of distribution, imply the existence of capital as an agent of production. They are forms of distribution which have for their prerequisite capital as an agent of production. They are also forms of reproduction of capital. In the same manner, wages is wage-labor when considered under another head; the definite character which labor has in one case as an agent of production, appears in the other as a form of distribution. If labor were not fixed as wage-labor, its manner of participation in distribution would not appear as wages, as is the case, e.g., under slavery. Finally, rent—to take at once the most developed form of distribution—by means of which landed property receives its share of the products, implies the existence of large landed property (properly speaking, agriculture on a large scale) as an agent of production, and not simply land, no more than wages represents simply labor. The relations and methods of distribution appear, therefore, merely as the reverse sides of the agents of production. An individual who participates in production as a wage laborer, receives his share of the products, i.e. of the results of production, in the form of wages. The subdivisions and organization of distribution are determined by the subdivisions and organization of production. Distribution is itself a product of production, not only in so far as the material goods are concerned, since only the results of production can be distributed; but also as regards its form, since the definite manner of participation in production determines the particular form of distribution, the form under which participation in distribution takes place. It is quite an illusion to place land under production, rent under distribution, etc. Economists, like Ricardo, who are accused above all of having paid exclusive attention to production, define distribution, therefore, as the exclusive subject of political economy, because they instinc tively regard the forms of distribution as the clearest forms in which the agents of production find expression in a given society. To the single individual distribution naturally appears as a law established by society determining his position in the sphere of production, within which be produces, and thus antedating production. At the outset the individual has no capital, no landed property. From his birth he is assigned to wage-labor by the social process of distribution. But this very condition of being assigned to wage-labor is the result of the existence of capital and landed property as independent agents of production. From the point of view of society as a whole, distribution seems to antedate and to determine production in another way as well, as a pre-economic fact, so to say. A conquering people divides the land among the conquerors, establishing thereby a certain division and form of landed property and determining the character of production; or, it turns the conquered people into slaves and thus makes slave labor the basis of production. Or, a nation, by revolution, breaks up large estates into small parcels of land and by this new distribution imparts to production a new character. Or, legislation perpetuates land ownership in large families or distributes labor as an hereditary privilege and thus fixes it in castes. In all of these cases, and they are all historic, it is not distribution that seems to be organized and determined by production, but on the contrary, production by distribution. In the most shallow conception of distribution, the latter appears as a distribution of products and to that extent as further removed from and quasi-independent of production. But before distribution means distribution of products, it is first, a distribution of the means of production, and second, what is practically another wording of the same fact, it is a distribution of the members of society among the various kinds of production (the subjection of individuals to certain conditions of production). The distribution of products is manifestly a result of this distribution, which is bound up with the process of production and determines the very organization of the latter. To treat of production apart from the distribution which is comprised in it, is plainly an idle abstraction. Conversely, we know the character of the distribution of products the moment we are given the nature of that other distribution which forms originally a factor of production. Ricardo, who was concerned with the analysis of production as it is organized in modern society and who was the economist of production par excellence, for that very reason declares not production but distribution as the subject proper of modem economics. We have here another evidence of the insipidity of the economists who treat production as an eternal truth, and banish history to the domain of distribution.

What relation to production this distribution, which has a determining influence on production itself, assumes, is plainly a question which falls within the province of production. Should it be maintained that at least to the extent that production depends on a certain distribution of the instruments of production, distribution in that sense precedes production and constitutes its prerequisite; it may be replied that production has in fact its prerequisite conditions, which form factors of it. These may appear at first to have a natural origin. By the very process of production they are changed from natural to historical, and if they appear during one period as a natural prerequisite of production, they formed at other periods its historical result. Within the sphere of production itself they are undergoing a constant change. E.g., the application of machinery produces a change in the distribution of the instruments of production as well as in that of products, and modern land ownership on a large scale is as much the result of modern trade and modern industry, as that of the application of the latter to agriculture. All of these questions resolve themselves in the last instance to this: How do general historical conditions affect production and what part does it play at all in the course of history? It is evident that this question can be taken up only in connection with the discussion and analysis of production. Yet in the trivial form in which these questions are raised above, they can be answered just as briefly. In the case of all conquests three ways lie open. The conquering people may impose its own methods of production upon the conquered (e.g., the English in Ireland in the nineteenth century, partly also in India); or, it may allow everything to remain as it was contenting itself with tribute (e.g., the Turks and the Romans); or, the two systems by mutually modifying each other may result in something new, a synthesis (which partly resulted from the Germanic conquests). In all of these conquests the method of production, be it of the conquerors, the conquered, or the one resulting from a combination of both, determines the nature of the new distribution which comes into play. Although the latter appears now as the prerequisite condition of the new period of production, it is in itself but a product of production, not of production belonging to history in general, but of production relating to a definite historical period. The Mongols with their devastations in Russia, e.g., acted in accordance with their system of production, for which sufficient pastures on large uninhabited stretches of country are the main prerequisite. The Germanic barbarians, with whom agriculture carried on with the aid of serfs was the traditional system of production and who were accustomed to lonely life in the country, could introduce the same conditions in the Roman provinces so much easier since the concentration of landed property which had taken place there, did away completely with the older systems of agriculture. There is a prevalent tradition that in certain periods robbery constituted the only source of living. But in order to be able to plunder, there must be something to plunder, i.e. there must be production. And even the method of plunder is determined by the method of production. A stockjobbing nation, e.g., cannot be robbed in the same manner as a nation of shepherds. In the case of the slave the instrument of production is robbed directly. But then the production of the country in whose interest he is robbed, must be so organized as to admit of slave labor, or (as in South America, etc.) a system of production must be introduced adapted to slavery. Laws may perpetuate an instrument of production, e.g., land, in certain families. These laws assume an economic importance if large landed property is in harmony with the system of production prevailing in society, as is the case, e.g., in England. In France agriculture had been carried on on a small scale in spite of the large estates, and the latter were, therefore, broken up by the Revolution. But how about the legislative attempt to perpetuate the minute subdivision of the land? In spite of these laws land ownership is concentrating again. The effect of legislation on the maintenance of a system of distribution and its resultant influence on production are to be determined elsewhere. c. Exchange and Circulation. Circulation is but a certain aspect of exchange, or it may be defined as exchange considered as a whole. Since exchange is an intermediary factor between production and its dependent, distribution, on the one hand, and consumption, on the other; and since the latter appears but as a constituent of production, exchange is manifestly also a constituent part of production. In the first place, it is clear that the exchange of activities and abilities which takes place in the sphere of production falls directly within the latter and constitutes one of its essential elements. In the second place, the same is true of the exchange of products, in so far as it is a means of completing a certain product, designed for immediate consumption. To that extent exchange constitutes an act included in production. Thirdly, the so-called exchange between dealers and dealers is by virtue of its organization determined by production, and is itself a species of productive activity. Exchange appears to be independent of and indifferent to production only in the last stage when products are exchanged directly for consumption. But in the first place, there is no exchange without a division of labor, whether natural or as a result of historical development; secondly, private exchange implies the existence of private production; thirdly, the intensity of exchange, as well as its extent and character are determined by the degree of development and organization of production, as, e.g., exchange between city and country, exchange in the country, in the city, etc. Exchange thus appears in all its aspects to be directly included in or determined by production. The result we arrive at is not that production, distribution, exchange, and consumption are identical, but that they are all members of one entity, different sides of one unit. Production predominates not only over production itself in the opposite sense of that term, but over the other elements as well. With it the process constantly starts over again. That exchange and consumption cannot be the predominating elements is self-evident. The same is true of distribution in the narrow sense of distribution of products; as for distribution in the sense of distribution of the agents of production, it is itself but a factor of production. A definite [form of] production thus determines the [forms of] consumption, distribution, exchange, and also the mutual relations between these various elements. Of course, production in its one-sided form is in its turn influenced by other elements; e.g., with the expansion of the market, i.e., of the sphere of exchange, production grows in volume and is subdivided to a greater extent. With a change in distribution, production undergoes a change; as, e.g., in the case of concentration of capital, of a change in the distribution of population in city and country, etc. Finally, the demands of consumption also influence production. A mutual interaction takes place between the various elements. Such is the case with every organic body.

3. THE METHOD OF POLITICAL ECONOMY

When we consider a given country from a politico-economic standpoint, we begin with its population, then analyze the latter according to its subdivision into classes, location in city, country, or by the sea, occupation in different branches of production; then we study its exports and imports, annual production and consumption, prices of commodities, etc. It seems to be the correct procedure to commence with the real and concrete aspect of conditions as they are; in the case of political economy, to commence with population which is the basis and the author of the entire productive activity of society. Yet, on closer consideration it proves to be wrong. Population is an abstraction, if we leave out, e.g., the classes of which it consists. These classes, again, are but an empty word, unless we know what are the elements on which they are based, such as wage-labor, capital, etc. These imply, in their turn, exchange, division of labor, prices, etc. Capital, e.g., does not mean anything without wagelabor, value, money, price, etc. If we start out, therefore, with population, we do so with a chaotic conception of the whole, and by closer analysis we will gradually anive at simpler ideas; thus we shall proceed from the imaginary concrete to less and less complex abstractions, until we get at the simplest conception. This once attained, we might start on our return journey until we would finally come back to population, but this time not as a chaotic notion of an integral whole, but as a rich aggregate of many conceptions and relations. The former method is the one which political economy had adopted in the past at its inception. The economists of the seventeenth century, e.g., always started out with the living aggregate: population, nation, state, several states, etc., but in the end they invariably arrived, by means of analysis, at certain leading, abstract general principles, such as division of labor, money, value, etc. As soon as these separate elements had been more or less established by abstract reasoning, there arose the systems of political economy which start from simple conceptions, such as labor, division of labor, demand, exchange value, and conclude with state, international exchange and world market. The latter is manifestly the scientifically correct method. The concrete is concrete, because it is a combination of many objects with different destinations, i.e. a unity of diverse elements. In our thought, it therefore appears as a process of synthesis, as a result, and not as a starting point, although it is the real starting point and, therefore, also the starting point of observation and conception. By the former method the complete conception passes into an abstract definition; by the latter, the abstract definitions lead to the reproduction of the concrete subject in the course of reasoning. Hegel fell into the error, therefore, of considering the real as the result of self-coordinating, self-absorbed, and spontaneously operating thought, while the method of advancing from the abstract to the concrete is but a way of thinking by which the concrete is grasped and is reproduced in our mind as a concrete. It is by no means, however, the process which itself generates the concrete. The simplest economic category, say, exchange value, implies the existence of population, population that is engaged in production under certain conditions; it also implies the existence of certain types of family, clan, or state, etc. It can have no other existence except as an abstract one-sided relation of an already given concrete and living aggregate. As a category, however, exchange value leads an antediluvian existence. And since our philosophic consciousness is so arranged that only the image of the man that it conceives appears to it as the real man and the world as it conceives it, as the real world; it mis- takes the movement of categories for the real act of production (which unfortunately (?) receives only its impetus from outside) whose result is the world; that is true—here we have, however, again a tautology—in so far as the concrete aggregate is a thought aggregate, in so far as the concrete subject of our thought is in fact a product of thought, of comprehension; not, however, in the sense of a product of a self-emanating conception which works outside of and stands above observation and imagination, but of a mental consummation of observation and imagination. The whole, as it appears in our heads as a thought-aggregate, is the product of a thinking mind which grasps the world in the only way open to it, a way which differs from the one employed by the artistic, religious, or practical mind. The concrete subject continues to lead an independent existence after it has been grasped, as it did before, outside of the head, so long as the head contemplates it only speculatively, theoretically. So that in the employment of the theoretical method [in political economy], the subject, society, must constantly be kept in mind as the premise from which we start. But have these simple categories no independent historical or natural existence antedating the more concrete ones? Qa depend. For instance, in his Philosophy of Law Hegel rightly starts out with possession, as the simplest legal relation of individuals. But there is no such thing as possession before the family or the relations of lord and serf, which are a great deal more concrete relations, have come into existence. On the other hand, one would be right in saying that there are families and clans which only possess, but do not own things. The simpler category thus appears as a relation of simple family and clan communities with respect to property. In earlier society the category appears as a simple relation of a developed organism, but the concrete substratum from which springs the relation of possession, is always implied. One can imagine an isolated ravage in possession of things. But in that case possession is no legal relation. It is not true that the family came as the result of the historical evolution of possession. On the contrary, the latter always implies the existence of this "more concrete category of law." Yet so much may be said, that the simple categories are the expression of relations in which the less developed concrete entity may have been realized without entering into the manifold relations and bearings which are mentally expressed in the concrete category; but when the concrete entity attains fuller development it will retain the same category as a subordinate relation. Money may exist and actually had existed in history before capital, or banks, or wage-labor came into existence. With that in mind, it may be said that the more simple category can serve as an expression of the predominant relations of an undeveloped whole or of the subordinate relations of a more developed whole, [relations] which had historically existed before the whole developed in the direction expressed in the more concrete category. In so far, the laws of abstract reasoning which ascends from the most simple to the complex, correspond to the actual process of history. On the other hand, it may be said that there are highly developed but historically unripe forms of society in which the highest economic forms are to be found, such as co-operation, advanced division of labor., etc., and yet there is no money in existence, e.g., Peru. In Slavic communities also, money, as well as exchange to which it owes its existence, does not appear at all or very little within the separate communities, but it appears on their boundaries in their inter-communal traffic; in general, it is erroneous to consider exchange as a constituent element originating within the community. It appears at first more in the mutual relations between different communities, than in those between the members of the same community. Furthermore, although money begins to play its part everywhere at an early stage, it plays in antiquity the part of a predominant element only in one-sidedly developed nations, viz. trading nations, and even in most cultured antiquity, in Greece and Rome, it attains its full development, which constitutes the prerequisite of modern bourgeois society, only in the period of their decay. Thus, this quite simple category attained its culmination in the past only at the most advanced stages of society. Even then it did not pervade (?) all economic relations; in Rome, e.g., at the time of its highest development taxes and payments in kind remained the basis. As a matter of fact, the money system was fully developed there only so far as the army was concerned; it never came to dominate the entire system of labor. Thus, although the simple category may have existed historically before the more concrete one, it can attain its complete internal and external development only in complex (?) forms of society, while the more concrete category has reached its full development in a less advanced form of society. Labor is quite a simple category. The idea of labor in that sense, as labor in general, is also very old. Yet, "labor" thus simply defined by political economy is as much a modern category, as the conditions which have given rise to this simple abstraction. The monetary system, e.g., defines wealth quite objectively, as a thing (?) in money. Compared with this point of view, it was a great step forward, when the industrial or commercial system came to see the source of wealth not in the object but in the activity of persons, viz. in commercial and industrial labor. But even the latter was thus considered only in the limited sense of a money-producing activity. The physiocratic system [marks still further progress] in that it considers a certain form of labor, viz. agriculture, as the source of wealth, and wealth itself not in the disguise of money, but as a product in general, as the general result of labor. But corresponding to the limitations of the activity, this product is still only a natural product. Agriculture is productive, land is the source of production par excellence. It was a tremendous advance on the part of Adam Smith to throw aside all limitations which mark wealth-producing activity and [to define it] as labor in general, neither industrial, nor commercial, nor agricultural, or one as much as the other. Along with the universal character of wealth-creating activity we have now the universal character of the object defined as wealth, viz. product in general, or labor in general, but as past incorporated labor. How difficult and great was the transition, is evident from the way Adam Smith himelf falls back from time to time into the physiocratic system. Now, it might seem as though this amounted simply to finding an abstract expression for the simplest relation into which men have been mutually entering as producers from times of yore, no matter under what form of society. In one sense this is true. In another it is not. The indifference as to the particular kind of labor implies the existence of a highly developed aggregate of different species of concrete labor, none of which is any longer the predominant one. So do the most general abstractions commonly arise only where there is the highest concrete development, where one feature appears to be jointly possessed by many, and to be common to all. Then it cannot be thought of any longer in one particular form. On the other hand, this abstraction of labor is but the result of a concrete aggregate of different kinds of labor. The indifference to the particular kind of labor corresponds to a form of society in which individuals pass with ease from one kind of work to another, which makes it immaterial to them what particular kind of work may fall to their share. Labor has become here, not only categorically but really, a means of creating wealth in general and is no longer grown together with the individual into one particular destination. This state of affairs has found its highest development in the most modern of bourgeois societies, the United States. It is only here that the abstraction of the category "labor," "labor in general," labor sans phrase, the starting point of modern political economy, becomes realized in practice. Thus, the simplest abstraction which modern political economy sets up as its starting point, and which expresses a relation dating back to antiquity and prevalent under all forms of society, appears in this abstraction truly realized only as a category of the most modern society. It might be said that what appears in the United States as an historical product,—viz. the indifference as to the particular kind of labor— appears among the Russians, e.g., as a natural disposition. But it makes all the difference in the world whether barbarians have a natural predisposition which makes them applicable alike to everything, or whether civilized people apply themselves to everything. And, besides, this indifference of the Russians as to the kind of work they do, corresponds to their traditional practice of remaining in the rut of a quite definite occupation until they are thrown out of it by external influences. This example of labor strikingly shows how even the most abstract categories, in spite of their applicability to all epochs—just because of their abstract character—are by the very definiteness of the abstraction a product of historical conditions as well, and are fully applicable only to and under those conditions. The bourgeois society is the most highly developed and most highly differentiated historical organization of production. The categories which serve as the expression of its conditions and the comprehension of its own organization enable it at the same time to gain an insight into the organization and the conditions of production which had prevailed under all the past forms of society, on the ruins and constituent elements of which it has arisen, and of which it still drags along some unsurmounted remnants, while what had formerly been mere intimation has now developed to complete significance. The anatomy of the human being is the key to the anatomy of the ape. But the intimations of a higher animal in lower ones can be understood only if the animal of the higher order is already known. The bourgeois economy furnishes a key to ancient economy, etc. This is, however, by no means true of the method of those economists who blot out all historical differences and see the bourgeois form in all forms of society. One can understand the nature of tribute, tithes, etc., after one has learned the nature of rent. But they must not be considered identical. Since, furthermore, bourgeois society is but a form resulting from the development of antagonistic elements, some relations belonging to earlier forms of society are frequently to be found in it but in a crippled state or as a travesty of their former self, as e.g., communal property. While it may be said, therefore, that the categories of bourgeois economy contain what is true of all other forms of society, the statement is to be taken cum grano salis. They may contain these in a developed, or crippled, or caricatured form, but always essentially different. The so-called historical development amounts in the last analysis to this, that the last form considers its predecessors as stages leading up to itself and perceives them always one-sidedly, since it is very seldom and only under certain conditions that it is capable of self-criticism; of course, we do not speak here of such historical periods which appear to their own contemporaries as periods of decay. The Christian religion became capable to assist us to an objective view of past mythologies as soon as it was ready for self-criticism to a certain extent, dynamei so-to-say. In the same way bourgeois political economy first came to understand the feudal, the ancient, and the oriental societies as soon as the self-criticism of the bourgeois society had commenced. So far as bourgeois political economy has not gone into the mythology of purely (?) identifying the bourgeois system with the past, its criticism of the feudal system against which it still had to wage war resembled Christian criticism of the heathen religions or Protestant criticism of Catholicism. In the study of economic categories, as in the case of every historical and social science, it must be borne in mind that as in reality so in our mind the subject, in this case modern bourgeois society, is given and that the categories are therefore but forms of expression, manifestations of existence, and frequently but one-sided aspects of this subject, this definite society; and that, therefore, the origin of [political economy] as a science does not by any means date from the time to which it is referred as such. This is to be firmly held in mind because it has an immediate and important bearing on the matter of the subdivisions of the science. For instance, nothing seems more natural than to start with rent, with landed property, since it is bound up with land, the source of all production and all existence, and with the first form of production in all more or less settled communities, viz. agriculture. But nothing would be more erroneous. Under all forms of society there is a certain industry which predominates over all the rest and whose condition therefore determines the rank and influence of all the rest. It is the universal light with which all the other colors are tinged and are modified through its peculiarity. It is a special ether which determines the specific gravity of everything that appears in it. Let us take for example pastoral nations (mere hunting and fishing tribes are not as yet at the point from which real development commences). They engage in a certain form of agriculture, sporadically. The nature of land-ownership is determined thereby. It is held in common and retains this form more or less according to the extent to which these nations hold on to traditions; such, e.g., is land-ownership among the Slavs. Among nations, whose agriculture is carried on by a settled population—the settled state constituting a great advance—where agriculture is the predominant industry, such as in ancient and feudal societies, even the manufacturing industry and its organization, as well as the forms of property which pertain to it, have more or less the characteristic features of the prevailing system of land ownership; [society] is then either entirely dependent upon agriculture, as in the case of ancient Rome, or, as in the Middle Ages, it imitates in its city relations the forms of organization prevailing in the country. Even capital, with the exception of pure money capital, has, in the form of the traditional working tool, the characteristics of land ownership in the Middle Ages. The reverse is true of bourgeois society. Agriculture comes to be more and more merely a branch of industry and is completely dominated by capital. The same is true of rent. In all the forms of society in which land ownership is the prevalent form, the influence of the natural element is the predominant one. In those where capital predominates the prevailing element is the one historically created by society. Rent cannot be understood without capital, nor can capital, without rent. Capital is the all-dominating economic power of bourgeois society. It must form the starting point as well as the end and be developed before land-ownership is. After each has been considered separately, their mutual relation must be analyzed. It would thus be impractical and wrong to arrange the economic categories in the order in which they were the determining factors in the course of history. Their order of sequence is rather determined by the relation which they bear to one another in modem bourgeois society, and which is the exact opposite of what seems to be their natural order or the order of their historical development. What we are interested in is not the place which economic relations occupy in the historical succession of different forms of society. Still less are we interested in the order of their succession "in idea" (Proudhon), which is but a hazy (?) conception of the course of history. We are interested in their organic connection within modern bourgeois society. The sharp line of demarkation (abstract precision) which so clearly distinguished the trading nations of antiquity, such as the Phoenicians and the Carthaginians, was due to that very predominance of agriculture. Capital as trading or money capital appears in that abstraction, where capital does not constitute as yet the predominating element of society. The Lombardians and the Jews occupied the same position among the agricultural nations of the Middle Ages. As a further illustration of the fact that the same category plays different parts at different stages of society, we may mention the following: one of the latest forms of bourgeois society, viz. stock companies, appear also at its beginning in the form of the great chartered monopolistic trading companies. The conception of national wealth which is imperceptibly formed in the minds of the economists of the seventeenth century, and which partly continues to be entertained by those of the eighteenth century, is that wealth is produced solely for the state, but that the power of the latter is proportional to that wealth. It was as yet an unconsciously hypocritical way in which wealth announced itself and its own production as the aim of modern states considering the latter merely as a means to the production of wealth. The order of treatment must manifestly be as follows: first, the general abstract definitions which are more or less applicable to all forms of society, but in the sense indicated above. Second, the categories which go to make up the inner organization of bourgeois society and constitute the foundations of the principal classes; capital, wage-labor, landed property; their mutual relations; city and country; the three great social classes, the exchange between them; circulation, credit (private). Third, the organization of bourgeois society in the form of a state, considered in relation to itself; the "unproductive" classes; taxes; public debts; public credit; population; colonies; emigration. Fourth, the international organization of production; international division of labor; international exchange; import and export; rate of exchange. Fifth, the world market and crises.

Theses On Feuerbach

I

The chief defect of all hitherto existing materialism – that of Feuerbach included – is that the thing, reality, sensuousness, is conceived only in the form of the *object or of contemplation*, but not as *sensuous human activity, practice*, not subjectively. Hence, in contradistinction to materialism, the *active* side was developed abstractly by idealism – which, of course, does not know real, sensuous activity as such.

Feuerbach wants sensuous objects, really distinct from the thought objects, but he does not conceive human activity itself as *objective* activity. Hence, in The Essence of Christianity, he regards the theoretical attitude as the only genuinely human attitude, while practice is conceived and fixed only in its dirty-judaical manifestation. Hence he does not grasp the significance of "revolutionary", of "practical-critical", activity.

II

The question whether objective truth can be attributed to human thinking is not a question of theory but is a practical question. Man must prove the truth — i.e. the reality and power, the this-sidedness of his thinking in practice. The dispute over the reality or non-reality of thinking that is isolated from practice is a purely *scholastic* question.

III

The materialist doctrine concerning the changing of circumstances and upbringing forgets that circumstances are changed by men and that it is essential to educate the educator himself. This doctrine must, therefore, divide society into two parts, one of which is superior to society.

The coincidence of the changing of circumstances and of human activity or self-changing can be conceived and rationally understood only as *revolutionary practice*.

IV

Feuerbach starts out from the fact of religious self-alienation, of the duplication of the world into a religious world and a secular one. His work consists in resolving the religious world into its secular basis.

But that the secular basis detaches itself from itself and establishes itself as an independent realm in the clouds can only be explained by the cleavages and self-contradictions within this secular basis. The latter must, therefore, in itself be both understood in its contradiction and revolutionized in practice. Thus, for instance, after the earthly family is discovered to be the secret of the holy family, the former must then itself be destroyed in theory and in practice.

V

Feuerbach, not satisfied with abstract thinking, wants contemplation; but he does not conceive sensuousness as practical, human-sensuous activity.

VI

Feuerbach resolves the religious essence into the human essence. But the human essence is no abstraction inherent in each single individual.

In its reality it is the ensemble of the social relations.

Feuerbach, who does not enter upon a criticism of this real essence, is consequently compelled:

To abstract from the historical process and to fix the religious sentiment as something by itself and to presuppose an abstract – isolated – human individual.

Essence, therefore, can be comprehended only as "genus", as an internal, dumb generality which naturally unites the many individuals.

VII

Feuerbach, consequently, does not see that the "religious sentiment" is itself a social product, and that the abstract individual whom he analyses belongs to a particular form of society.

VIII

All social life is essentially practical. All mysteries which lead theory to mysticism find their rational solution in human practice and in the comprehension of this practice.

IX

The highest point reached by contemplative materialism, that is, materialism which does not comprehend sensuousness as practical activity, is contemplation of single individuals and of civil society.

X

The standpoint of the old materialism is civil society; the standpoint of the new is human society, or social humanity.

XI

The philosophers have only interpreted the world, in various ways; the point is to change it.

Part I: Feuerbach Opposition of the Materialist and Idealist Outlook

A. Idealism and Materialism

The Illusions of German Ideology

As we hear from German ideologists, Germany has in the last few years gone through an unparalleled revolution. The decomposition of the Hegelian philosophy, which began with Strauss, has developed into a universal ferment into which all the "powers of the past" are swept. In the general chaos mighty empires have arisen only to meet with immediate doom, heroes have emerged momentarily only to be hurled back into obscurity by bolder and stronger rivals. It was a revolution beside which the French Revolution was child's play, a world struggle beside which the struggles of the Diadochi [successors of Alexander the Great] appear insignificant. Principles ousted one another, heroes of the mind overthrew each other with unheard-of rapidity, and in the three years 1842-45 more of the past was swept away in Germany than at other times in three centuries.

All this is supposed to have taken place in the realm of pure thought.

Certainly it is an interesting event we are dealing with: the putrescence of the absolute spirit. When the last spark of its life had failed, the various components of this *caput mortuum* began to decompose, entered into new combinations and formed new substances. The industrialists of philosophy, who till then had lived on the exploitation of the absolute spirit, now seized upon the new combinations. Each with all possible zeal set about retailing his apportioned share. This naturally gave rise to competition, which, to start with, was carried on in moderately staid bourgeois fashion. Later when the German market was glutted, and the commodity in spite of all efforts found no response in the world market, the business was spoiled in the usual German manner by fabricated and fictitious production, deterioration in quality, adulteration of the raw materials, falsification of labels, fictitious purchases, bill-jobbing and a credit system devoid of any real basis. The competition turned into a bitter struggle, which is now being extolled and interpreted to us as a revolution of world significance, the begetter of the most prodigious results and achievements.

If we wish to rate at its true value this philosophic charlatanry, which awakens even in the breast of the honest German citizen a glow of national pride, if we wish to bring out clearly the pettiness, the parochial narrowness of this whole Young-Hegelian movement and in particular the tragicomic contrast between the illusions of these heroes about their achievements and the actual achievements themselves, we must look at the whole spectacle from a standpoint beyond the frontiers of Germany.

[In the first version of the clean copy there follows a passage, which is crossed out:] |p. 21|

We preface therefore the specific criticism of individual representatives of this movement with a few general observations, elucidating the ideological premises common to all of them. These remarks will suffice to indicate the standpoint of our criticism insofar as it is required for the understanding and the motivation of the subsequent individual criticisms. We oppose these remarks |p. 3| to Feuerbach in particular because he is the only one who has at least made some progress and whose works can be examined de bonne foi.

1. Ideology in General, and Especially German Philosophy

A. We know only a single science, the science of history. One can look at history from two sides and divide it into the history of nature and the history of men. The two sides are, however, inseparable; the history of nature and the history of men are dependent on each other so long as men exist. The history of nature, called natural science, does not concern us here; but we will have to examine the history of men, since almost the whole ideology amounts either to a distorted conception of this history or to a complete abstraction from it. Ideology is itself only one of the aspects of this history.

[There follows a passage dealing with the premises of the materialist conception of history. It is not crossed out and in this volume it is reproduced as Section 2; see pp. 31-32]

Ideology in General, German Ideology in Particular

German criticism has, right up to its latest efforts, never quitted the realm of philosophy. Far from examining its general philosophic premises, the whole body of its inquiries has actually sprung from the soil of a definite philosophical system, that of Hegel. Not only in their answers but in their very questions there was a mystification. This dependence on Hegel is the reason why not one of these modern critics has even attempted a comprehensive criticism of the Hegelian system, however much each professes to have advanced beyond Hegel. Their polemics against Hegel and against one another are confined to this – each extracts one side of the Hegelian system and turns this against the whole system as well as against the sides extracted by the others. To begin with they extracted pure unfalsified Hegelian categories such as "substance" and "self-consciousness," later they desecrated these categories with more secular names such as species "the Unique," "Man," etc.

The entire body of German philosophical criticism from Strauss to Stirner is confined to criticism of religious conceptions. [The following passage is crossed out in the manuscript:] claiming to be the absolute redeemer of the world from all evil. Religion was continually regarded and treated as the arch-enemy, as the ultimate cause of all relations repugnant to these philosophers. The critics started from real religion and actual theology. What religious consciousness and a religious conception really meant was determined variously as they went along. Their advance consisted in subsuming the allegedly dominant metaphysical, political, juridical, moral and other conceptions under the class of religious or theological conceptions; and similarly in pronouncing political, juridical, moral consciousness as religious or theological, and the political, juridical, moral man – "man" in the last resort – as religious. The dominance of religion was taken for granted. Gradually every dominant relationship was pronounced a religious relationship and transformed into a cult, a cult of law, a cult of the State, etc. On all sides it was only a question of dogmas and belief in dogmas. The world was sanctified to an ever-increasing extent till at last our venerable Saint Max was able to canonise it *en bloc* and thus dispose of it once for all.

The Old Hegelians had comprehended everything as soon as it was reduced to an Hegelian logical category. The Young Hegelians criticised everything by attributing to it religious conceptions or by pronouncing it a theological matter. The Young Hegelians are in agreement with the Old Hegelians in their belief in the rule of religion, of concepts, of a universal principle in the existing world. Only, the one party attacks this dominion as usurpation, while the other extols it as legitimate.

Since the Young Hegelians consider conceptions, thoughts, ideas, in fact all the products of consciousness, to which they attribute an independent existence, as the real chains of men (just as the Old Hegelians declared them the true bonds of human society) it is evident that the Young Hegelians have to fight only against these illusions of consciousness. Since, according to their fantasy, the relationships of men, all their doings, their chains and their limitations are products of their consciousness, the Young Hegelians logically put to men the moral postulate of exchanging their present consciousness for human, critical or egoistic consciousness, and thus of removing their limitations. This demand to change consciousness amounts to a demand to interpret reality in another way, i.e. to recognise it by means of another interpretation. The Young-Hegelian ideologists, in spite of their allegedly "world-shattering" statements, are the staunchest conservatives. The most recent of them have found the correct expression for their activity when they declare they are only fighting against "phrases." They forget, however, that to these phrases they themselves are only opposing other phrases, and that they are in no way combating the real existing world when they are merely combating the phrases of this world. The only results which this philosophic criticism could achieve were a few (and at that thoroughly one-sided) elucidations of Christianity from the point of view of religious history; all the rest of their assertions are only further embellishments of their claim to have furnished, in these unimportant elucidations, discoveries of universal importance.

It has not occurred to any one of these philosophers to inquire into the connection of German philosophy with German reality, the relation of their criticism to their own material surroundings.

First Premises of Materialist Method

The premises from which we begin are not arbitrary ones, not dogmas, but real premises from which abstraction can only be made in the imagination. They are the real individuals, their activity and the material conditions under which they live, both those which they find already existing and those produced by their activity. These premises can thus be verified in a purely empirical way.

The first premise of all human history is, of course, the existence of living human individuals. Thus the first fact to be established is the physical organisation of these individuals and their consequent relation to the rest of nature. Of course, we cannot here go either into the actual physical nature of man, or into the natural conditions in which man finds himself – geological, hydrographical, climatic and so on. The writing of history must always set out from these natural bases and their modification in the course of history through the action of men.

Men can be distinguished from animals by consciousness, by religion or anything else you like. They themselves begin to distinguish themselves from animals as soon as they begin to produce their means of subsistence, a step which is conditioned by their physical organisation. By producing their means of subsistence men are indirectly producing their actual material life.

The way in which men produce their means of subsistence depends first of all on the nature of the actual means of subsistence they find in existence and have to reproduce. This mode of production must not be considered simply as being the production of the physical existence of the individuals. Rather it is a definite form of activity of these individuals, a definite form of expressing their life, a definite mode of life on their part. As individuals express their life, so they are. What they are, therefore, coincides with their production, both with what they produce and with how they produce. The nature of individuals thus depends on the material conditions determining their production.

This production only makes its appearance with the increase of population. In its turn this presupposes the intercourse [*Verkehr*] of individuals with one another. The form of this intercourse is again determined by production.

[3. Production and Intercourse. Division of Labour and Forms of Property – Tribal, Ancient, Feudal]

The relations of different nations among themselves depend upon the extent to which each has developed its productive forces, the division of labour and internal intercourse. This statement is generally recognised. But not only the relation of one nation to others, but also the whole internal structure of the nation itself depends on the stage of development reached by its production and its internal and external intercourse. How far the productive forces of a nation are developed is shown most manifestly by the degree to which the division of labour has been carried. Each new productive force, insofar as it is not merely a quantitative extension of productive forces already known (for instance the bringing into cultivation of fresh land), causes a further development of the division of labour.

The division of labour inside a nation leads at first to the separation of industrial and commercial from agricultural labour, and hence to the separation of town and country and to the conflict of their interests. Its further development leads to the separation of commercial from industrial labour. At the same time through the division of labour inside these various branches there develop various divisions among the individuals co-operating in definite kinds of labour. The relative position of these individual groups is determined by the methods employed in agriculture, industry and commerce (patriarchalism, slavery, estates, classes). These same conditions are to be seen (given a more developed intercourse) in the relations of different nations to one another.

The various stages of development in the division of labour are just so many different forms of ownership, i.e. the existing stage in the division of labour determines also the relations of individuals to one another with reference to the material, instrument, and product of labour.

The first form of ownership is tribal [*Stammeigentum*] ownership. It corresponds to the undeveloped stage of production, at which a people lives by hunting and fishing, by the rearing of beasts or, in the highest stage, agriculture. In the latter case it presupposes a great mass of uncultivated stretches of land. The division of labour is at this stage still very elementary and is confined to a further extension of the natural division of labour existing in the family. The social structure is, therefore, limited to an extension of the family; patriarchal family chieftains, below them the members of the tribe, finally slaves. The slavery latent in the family only develops gradually with the increase of population, the growth of wants, and with the extension of external relations, both of war and of barter.

The second form is the ancient communal and State ownership which proceeds especially from the union of several tribes into a city by agreement or by conquest, and which is still accompanied by slavery. Beside communal ownership we already find movable, and later also immovable, private property developing, but as an abnormal form subordinate to communal ownership. The citizens hold power over their labouring slaves only in their community, and on this account alone, therefore, they are bound to the form of communal ownership. It is the communal private property which compels the active citizens to remain in this spontaneously derived form of association over against their slaves. For this reason the whole structure of society based on this communal ownership, and with it the power of the people, decays in the same measure as, in particular, immovable private property evolves. The division of labour is already more developed. We already find the antagonism of town and country; later the antagonism between those states which represent town interests and those which represent country interests, and inside the towns themselves the antagonism between industry and maritime commerce. The class relation between citizens and slaves is now completely developed.

With the development of private property, we find here for the first time the same conditions which we shall find again, only on a more extensive scale, with modern private property. On the one hand, the concentration of private property, which began very early in Rome (as the Licinian agrarian law proves) and proceeded very rapidly from the time of the civil wars and especially under the Emperors; on the other hand, coupled with this, the transformation of the plebeian small peasantry into a proletariat, which, however, owing to its intermediate position between propertied citizens and slaves, never achieved an independent development.

The third form of ownership is feudal or estate property. If antiquity started out from the town and its little territory, the Middle Ages started out from the country. This different starting-point was determined by the sparseness of the population at that time, which was scattered over a large area and which received no large increase from the conquerors. In contrast to Greece and Rome, feudal development at the outset, therefore, extends over a much wider territory, prepared by the Roman conquests and the spread of agriculture at first associated with it. The last centuries of the declining Roman Empire and its conquest by the barbarians destroyed a number of productive forces; agriculture had declined, industry had decayed for want of a market, trade had died out or been violently suspended, the rural and urban population had decreased. From these conditions and the mode of organisation of the conquest determined by them, feudal property developed under the influence of the Germanic military constitution. Like tribal and communal ownership, it is based again on a community; but the directly producing class standing over against it is not, as in the case of the ancient community, the slaves, but the enserfed small peasantry. As soon as feudalism is fully developed, there also arises antagonism to the towns. The hierarchical structure of land ownership, and the armed bodies of retainers associated with it, gave the nobility power over the serfs. This feudal organisation was, just as much as the ancient communal ownership, an association against a subjected producing class; but the form of association and the relation to the direct producers were different because of the different conditions of production.

This feudal system of land ownership had its counterpart in the *towns* in the shape of corporative property, the feudal organisation of trades. Here property consisted chiefly in the labour of each individual person. The necessity for association against the organised robber-nobility, the need for communal covered markets in an age when the industrialist was at the same time a merchant, the growing competition of the escaped serfs swarming into the rising towns, the feudal structure of the whole country: these combined to bring about the guilds. The gradually accumulated small capital of individual craftsmen and their stable numbers, as against the growing population, evolved the relation of journeyman and apprentice, which brought into being in the towns a hierarchy similar to that in the country.

Thus the chief form of property during the feudal epoch consisted on the one hand of landed property with serf labour chained to it, and on the other of the labour of the individual with small capital commanding the labour of journeymen. The organisation of both was determined by the restricted conditions of production – the small-scale and primitive cultivation of the land, and the craft type of industry. There was little division of labour in the heyday of feudalism. Each country bore in itself the antithesis of town and country; the division into estates was certainly strongly marked; but apart from the differentiation of princes, nobility, clergy and peasants in the country, and masters, journeymen, apprentices and soon also the rabble of casual labourers in the towns, no division of importance took place. In agriculture it was rendered difficult by the strip-system, beside which the cottage industry of the peasants themselves emerged. In industry there was no division of labour at all in the individual trades themselves, and very little between them. The separation of industry and commerce was found already in existence in older towns; in the newer it only developed later, when the towns entered into mutual relations.

The grouping of larger territories into feudal kingdoms was a necessity for the landed nobility as for the towns. The organisation of the ruling class, the nobility, had, therefore, everywhere a monarch at its head.

[4. The Essence of the Materialist Conception of History. Social Being and Social Consciousness]

The fact is, therefore, that definite individuals who are productively active in a definite way enter into these definite social and political relations. Empirical observation must in each separate instance bring out empirically, and without any mystification and speculation, the connection of the social and political structure with production. The social structure and the State are continually evolving out of the life-process of definite individuals, but of individuals, not as they may appear in their own or other people's imagination, but as they really are; i.e. as they operate, produce materially, and hence as they work under definite material limits, presuppositions and conditions independent of their will.

[The following passage is crossed out in the manuscript:] The ideas which these individuals form are ideas either about their relation to nature or about their mutual relations or about their own nature. It is evident that in all these cases their ideas are the conscious expression – real or illusory – of their real relations and activities, of their production, of their intercourse, of their social and political conduct. The opposite assumption is only possible if in addition to the spirit of the real, materially evolved individuals a separate spirit is presupposed. If the conscious expression of the real relations of these individuals is illusory, if in their imagination they turn reality upside-down, then this in its turn is the result of their limited material mode of activity and their limited social relations arising from it.

The production of ideas, of conceptions, of consciousness, is at first directly interwoven with the material activity and the material intercourse of men, the language of real life. Conceiving, thinking, the mental intercourse of men, appear at this stage as the direct efflux of their material behaviour. The same applies to mental production as expressed in the language of politics, laws, morality, religion, metaphysics, etc., of a people. Men are the producers of their conceptions, ideas, etc. – real, active men, as they are conditioned by a definite development of their productive forces and of the intercourse corresponding to these, up to its furthest forms. Consciousness can never be anything else than conscious existence, and the existence of men is their actual life-process. If in all ideology men and their circumstances appear upside-down as in a *camera obscura*, this phenomenon arises just as much from their historical life-process as the inversion of objects on the retina does from their physical life-process.

In direct contrast to German philosophy which descends from heaven to earth, here we ascend from earth to heaven. That is to say, we do not set out from what men say, imagine, conceive, nor from men as narrated, thought of, imagined, conceived, in order to arrive at men in the flesh. We set out from real, active men, and on the basis of their real life-process we demonstrate the development of the ideological reflexes and echoes of this life-process. The phantoms formed in the human brain are also, necessarily, sublimates of their material life-process, which is empirically verifiable and bound to material premises. Morality, religion, metaphysics, all the rest of ideology and their corresponding forms of consciousness, thus no longer retain the semblance of independence. They have no history, no development; but men, developing their material production and their material intercourse, alter, along with this their real existence, their thinking and the products of their thinking. Life is not determined by consciousness, but consciousness by life. In the first method of approach the starting-point is consciousness taken as the living individual; in the second method, which conforms to real life, it is the real living individuals themselves, and consciousness is considered solely as their consciousness.

This method of approach is not devoid of premises. It starts out from the real premises and does not abandon them for a moment. Its premises are men, not in any fantastic isolation and rigidity, but in their actual, empirically perceptible process of development under definite conditions. As soon as this active life-process is described, history ceases to be a collection of dead facts as it is with the empiricists (themselves still abstract), or an imagined activity of imagined subjects, as with the idealists.

Where speculation ends – in real life – there real, positive science begins: the representation of the practical activity, of the practical process of development of men. Empty talk about consciousness ceases, and real knowledge has to take its place. When reality is depicted, philosophy as an independent branch of knowledge loses its medium of existence. At the best its place can only be taken by a summing-up of the most general results, abstractions which arise from the observation of the historical development of men. Viewed apart from real history, these abstractions have in themselves no value whatsoever. They can only serve to facilitate the arrangement of historical material, to indicate the sequence of its separate strata. But they by no means afford a recipe or schema, as does philosophy, for neatly trimming the epochs of history. On the contrary, our difficulties begin only when we set about the observation and the arrangement – the real depiction – of our historical material, whether of a past epoch or of the present. The removal of these difficulties is governed by premises which it is quite impossible to state here, but which only the study of the actual life-process and the activity of the individuals of each epoch will make evident. We shall select here some of these abstractions, which we use in contradistinction to the ideologists, and shall illustrate them by historical examples.

History: Fundamental Conditions

Since we are dealing with the Germans, who are devoid of premises, we must begin by stating the first premise of all human existence and, therefore, of all history, the premise, namely, that men must be in a position to live in order to be able to "make history." But life involves before everything else eating and drinking, a habitation, clothing and many other things. The first historical act is thus the production of the means to satisfy these needs, the production of material life itself. And indeed this is an historical act, a fundamental condition of all history, which today, as thousands of years ago, must daily and hourly be fulfilled merely in order to sustain human life. Even when the sensuous world is reduced to a minimum, to a stick as with Saint Bruno [Bauer], it presupposes the action of producing the stick. Therefore in any interpretation of history one has first of all to observe this fundamental fact in all its significance and all its implications and to accord it its due importance. It is well known that the Germans have never done this, and they have never, therefore, had an earthly basis for history and consequently never an historian. The French and the English, even if they have conceived the relation of this fact with so-called history only in an extremely one-sided fashion, particularly as long as they remained in the toils of political ideology, have nevertheless made the first attempts to give the writing of history a materialistic basis by being the first to write histories of civil society, of commerce and industry.

The second point is that the satisfaction of the first need (the action of satisfying, and the instrument of satisfaction which has been acquired) leads to new needs; and this production of new needs is the first historical act. Here we recognise immediately the spiritual ancestry of the great historical wisdom of the Germans who, when they run out of positive material and when they can serve up neither theological nor political nor literary rubbish, assert that this is not history at all, but the "prehistoric era." They do not, however, enlighten us as to how we proceed from this nonsensical "prehistory" to history proper; although, on the other hand, in their historical speculation they seize upon this "prehistory" with especial eagerness because they imagine themselves safe there from interference on the part of "crude facts," and, at the same time, because there they can give full rein to their speculative impulse and set up and knock down hypotheses by the thousand.

The third circumstance which, from the very outset, enters into historical development, is that men, who daily remake their own life, begin to make other men, to propagate their kind: the relation between man and woman, parents and children, the family. The family, which to begin with is the only social relationship, becomes later, when increased needs create new social relations and the increased population new needs, a subordinate one (except in Germany), and must then be treated and analysed according to the existing empirical data, not according to "the concept of the family," as is the custom in Germany. [1] These three aspects of social activity are not of course to be taken as three different stages, but just as three aspects or, to make it clear to the Germans, three "moments," which have existed simultaneously since the dawn of history and the first men, and which still assert themselves in history today.

The production of life, both of one's own in labour and of fresh life in procreation, now appears as a double relationship: on the one hand as a natural, on the other as a social relationship. By social we understand the co-operation of several individuals, no matter under what conditions, in what manner and to what end. It follows from this that a certain mode of production, or industrial stage, is always combined with a certain mode of co-operation, or social stage, and this mode of co-operation is itself a "productive force." Further, that the multitude of productive forces accessible to men determines the nature of society, hence, that the "history of humanity" must always be studied and treated in relation to the history of industry and exchange. But it is also clear how in Germany it is impossible to write this sort of history, because the Germans lack not only the necessary power of comprehension and the material but also the "evidence of their senses," for across the Rhine you cannot have any experience of these things since history has stopped happening. Thus it is quite obvious from the start that there exists a materialistic connection of men with one another, which is determined by their needs and their mode of production, and which is as old as men themselves. This connection is ever taking on new forms, and thus presents a "history" independently of the existence of any political or religious nonsense which in addition may hold men together.

Only now, after having considered four moments, four aspects of the primary historical relationships, do we find that man also possesses "consciousness," but, even so, not inherent, not "pure" consciousness. From the start the "spirit" is afflicted with the curse of being "burdened" with matter, which here makes its appearance in the form of agitated layers of air, sounds, in short, of language. Language is as old as consciousness, language is practical consciousness that exists also for other men,[A] and for that reason alone it really exists for me personally as well; language, like consciousness, only arises from the need, the necessity, of intercourse with other men. Where there exists a relationship, it exists for me: the animal does not enter into "relations" with anything, it does not enter into any relation at all. For the animal, its relation to others does not exist as a relation. Consciousness is, therefore, from the very beginning a social product, and remains so as long as men exist at all. Consciousness is at first, of course, merely consciousness concerning the immediate sensuous environment and consciousness of the limited connection with other persons and things outside the individual who is growing self-conscious. At the same time it is consciousness of nature, which first appears to men as a completely alien, all-powerful and unassailable force, with which men's relations are purely animal and by which they are overawed like beasts; it is thus a purely animal consciousness of nature (natural religion) just because nature is as yet hardly modified historically. (We see here immediately: this natural religion or this particular relation of men to nature is determined by the form of society and vice versa. Here, as everywhere, the identity of nature and man appears in such a way that the restricted relation of men to nature determines their restricted relation to one another, and their restricted relation to one another determines men's restricted relation to nature.) On the other hand, man's consciousness of the necessity of associating with the individuals around him is the beginning of the consciousness that he is living in society at all. This beginning is as animal as social life itself at this stage. It is mere herd-consciousness, and at this point man is only distinguished from sheep by the fact that with him consciousness takes the place of instinct or that his instinct is a conscious one. This sheep-like or tribal consciousness receives its further development and extension through increased productivity, the increase of needs, and, what is fundamental to both of these, the increase of population. With these there develops the division of labour, which was originally nothing but the division of labour in the sexual act, then that division of labour which develops spontaneously or "naturally" by virtue of natural predisposition (e.g. physical strength), needs, accidents, etc. etc. Division of labour only becomes truly such from the moment when a division of material and mental labour appears. (The first form of ideologists, priests, is concurrent.) From this moment onwards consciousness can really flatter itself that it is something other than consciousness of existing practice, that it really represents something without representing something real; from now on consciousness is in a position to emancipate itself from the world and to proceed to the formation of "pure" theory, theology, philosophy, ethics, etc. But even if this theory, theology, philosophy, ethics, etc. comes into contradiction with the existing relations, this can only occur because existing social relations have come into contradiction with existing forces of production; this, moreover, can also occur in a particular national sphere of relations through the appearance of the contradiction, not within the national orbit, but between this national consciousness and the practice of other nations, i.e. between the national and the general consciousness of a nation (as we see it now in Germany).

Moreover, it is quite immaterial what consciousness starts to do on its own: out of all such muck we get only the one inference that these three moments, the forces of production, the state of society, and consciousness, can and must come into contradiction with one another, because the division of labour implies the possibility, nay the fact that intellectual and material activity – enjoyment and labour, production and consumption – devolve on different individuals, and that the only possibility of their not coming into contradiction lies in the negation in its turn of the division of labour. It is self-evident, moreover, that "spectres," "bonds," "the higher being," “concept,” “scruple,” are merely the idealistic, spiritual expression, the conception apparently of the isolated individual, the image of very empirical fetters and limitations, within which the mode of production of life and the form of intercourse coupled with it move.

Private Property and Communism

With the division of labour, in which all these contradictions are implicit, and which in its turn is based on the natural division of labour in the family and the separation of society into individual families opposed to one another, is given simultaneously the distribution, and indeed the unequal distribution, both quantitative and qualitative, of labour and its products, hence property: the nucleus, the first form, of which lies in the family, where wife and children are the slaves of the husband. This latent slavery in the family, though still very crude, is the first property, but even at this early stage it corresponds perfectly to the definition of modern economists who call it the power of disposing of the labour-power of others. Division of labour and private property are, moreover, identical expressions: in the one the same thing is affirmed with reference to activity as is affirmed in the other with reference to the product of the activity.

Further, the division of labour implies the contradiction between the interest of the separate individual or the individual family and the communal interest of all individuals who have intercourse with one another. And indeed, this communal interest does not exist merely in the imagination, as the "general interest," but first of all in reality, as the mutual interdependence of the individuals among whom the labour is divided. And finally, the division of labour offers us the first example of how, as long as man remains in natural society, that is, as long as a cleavage exists between the particular and the common interest, as long, therefore, as activity is not voluntarily, but naturally, divided, man's own deed becomes an alien power opposed to him, which enslaves him instead of being controlled by him. For as soon as the distribution of labour comes into being, each man has a particular, exclusive sphere of activity, which is forced upon him and from which he cannot escape. He is a hunter, a fisherman, a herdsman, or a critical critic, and must remain so if he does not want to lose his means of livelihood; while in communist society, where nobody has one exclusive sphere of activity but each can become accomplished in any branch he wishes, society regulates the general production and thus makes it possible for me to do one thing today and another tomorrow, to hunt in the morning, fish in the afternoon, rear cattle in the evening, criticise after dinner, just as I have a mind, without ever becoming hunter, fisherman, herdsman or critic. This fixation of social activity, this consolidation of what we ourselves produce into an objective power above us, growing out of our control, thwarting our expectations, bringing to naught our calculations, is one of the chief factors in historical development up till now. [2]

The social power, i.e., the multiplied productive force, which arises through the co-operation of different individuals as it is determined by the division of labour, appears to these individuals, since their co-operation is not voluntary but has come about naturally, not as their own united power, but as an alien force existing outside them, of the origin and goal of which they are ignorant, which they thus cannot control, which on the contrary passes through a peculiar series of phases and stages independent of the will and the action of man, nay even being the prime governor of these.

How otherwise could, for instance, property have had a history at all, have taken on different forms, and landed property, for example, according to the different premises given, have proceeded in France from parcellation to centralisation in the hands of a few, in England from centralisation in the hands of a few to parcellation, as is actually the case today? Or how does it happen that trade, which after all is nothing more than the exchange of products of various individuals and countries, rules the whole world through the relation of supply and demand – a relation which, as an English economist says, hovers over the earth like the fate of the ancients, and with invisible hand allots fortune and misfortune to men, sets up empires and overthrows empires, causes nations to rise and to disappear – while with the abolition of the basis of private property, with the communistic regulation of production (and, implicit in this, the destruction of the alien relation between men and what they themselves produce), the power of the relation of supply and demand is dissolved into nothing, and men get exchange, production, the mode of their mutual relation, under their own control again?

History as a Continuous Process

In history up to the present it is certainly an empirical fact that separate individuals have, with the broadening of their activity into world-historical activity, become more and more enslaved under a power alien to them (a pressure which they have conceived of as a dirty trick on the part of the so-called universal spirit, etc.), a power which has become more and more enormous and, in the last instance, turns out to be the world market. But it is just as empirically established that, by the overthrow of the existing state of society by the communist revolution (of which more below) and the abolition of private property which is identical with it, this power, which so baffles the German theoreticians, will be dissolved; and that then the liberation of each single individual will be accomplished in the measure in which history becomes transformed into world history. From the above it is clear that the real intellectual wealth of the individual depends entirely on the wealth of his real connections. Only then will the separate individuals be liberated from the various national and local barriers, be brought into practical connection with the material and intellectual production of the whole world and be put in a position to acquire the capacity to enjoy this all-sided production of the whole earth (the creations of man). *All-round* dependence, this natural form of the world-historical co-operation of individuals, will be transformed by this communist revolution into the control and conscious mastery of these powers, which, born of the action of men on one another, have till now overawed and governed men as powers completely alien to them. Now this view can be expressed again in speculative-idealistic, i.e. fantastic, terms as "self-generation of the species" ("society as the subject"), and thereby the consecutive series of interrelated individuals connected with each other can be conceived as a single individual, which accomplishes the mystery of generating itself. It is clear here that individuals certainly make one another, physically and mentally, but do not make themselves.

[5. Development of the Productive Forces as a Material Premise of Communism]

This “alienation” (to use a term which will be comprehensible to the philosophers) can, of course, only be abolished given two practical premises. For it to become an “intolerable” power, i.e. a power against which men make a revolution, it must necessarily have rendered the great mass of humanity “propertyless,” and produced, at the same time, the contradiction of an existing world of wealth and culture, both of which conditions presuppose a great increase in productive power, a high degree of its development. And, on the other hand, this development of productive forces (which itself implies the actual empirical existence of men in their world-historical, instead of local, being) is an absolutely necessary practical premise because without it want is merely made general, and with destitution the struggle for necessities and all the old filthy business would necessarily be reproduced; and furthermore, because only with this universal development of productive forces is a universal intercourse between men established, which produces in all nations simultaneously the phenomenon of the “propertyless” mass (universal competition), makes each nation dependent on the revolutions of the others, and finally has put world-historical, empirically universal individuals in place of local ones. Without this, (1) communism could only exist as a local event; (2) the forces of intercourse themselves could not have developed as universal, hence intolerable powers: they would have remained home-bred conditions surrounded by superstition; and (3) each extension of intercourse would abolish local communism. Empirically, communism is only possible as the act of the dominant peoples “all at once” and simultaneously, which presupposes the universal development of productive forces and the world intercourse bound up with communism. Moreover, the mass of propertyless workers – the utterly precarious position of labour – power on a mass scale cut off from capital or from even a limited satisfaction and, therefore, no longer merely temporarily deprived of work itself as a secure source of life – presupposes the world market through competition. The proletariat can thus only exist *world-historically*, just as communism, its activity, can only have a “world-historical” existence. World-historical existence of individuals means existence of individuals which is directly linked up with world history.

Communism is for us not a *state of affairs* which is to be established, an *ideal* to which reality [will] have to adjust itself. We call communism the *real* movement which abolishes the present state of things. The conditions of this movement result from the premises now in existence.

In the main we have so far considered only one aspect of human activity, the *reshaping* of nature by men. The other aspect, the *reshaping* of men by men ... [Intercourse and productive power]

Origin of the state and the relation of the state to civil society. ...

Footnotes

Contradiction between Individuals and their conditions of life

1. The building of houses. With savages each family has as a matter of course its own cave or hut like the separate family tent of the nomads. This separate domestic economy is made only the more necessary by the further development of private property. With the agricultural peoples a communal domestic economy is just as impossible as a communal cultivation of the soil. A great advance was the building of towns. In all previous periods, however, the abolition of individual economy, which is inseparable from the abolition of private property, was impossible for the simple reason that the material conditions governing it were not present. The setting-up of a communal domestic economy presupposes the development of machinery, of the use of natural forces and of many other productive forces – e.g. of water-supplies, of gas-lighting, steam-heating, etc., the removal [of the antagonism] of town and country. Without these conditions a communal economy would not in itself form a new productive force; lacking any material basis and resting on a purely theoretical foundation, it would be a mere freak and would end in nothing more than a monastic economy – What was possible can be seen in the towns brought about by condensation and the erection of communal buildings for various definite purposes (prisons, barracks, etc.). That the abolition of individual economy is inseparable from the abolition of the family is self-evident.

2. [This paragraph appears as a marginal note in the manuscript – *Ed.*] And out of this very contradiction between the interest of the individual and that of the community the latter takes an independent form as the *State*, divorced from the real interests of individual and community, and at the same time as an illusory communal life, always based, however, on the real ties existing in every family and tribal conglomeration – such as flesh and blood, language, division of labour on a larger scale, and other interests – and especially, as we shall enlarge upon later, on the classes, already determined by the division of labour, which in every such mass of men separate out, and of which one dominates all the others. It follows from this that all struggles within the State, the struggle between democracy, aristocracy, and monarchy, the struggle for the franchise, etc., etc., are merely the illusory forms in which the real struggles of the different classes are fought out among one another (of this the German theoreticians have not the faintest inkling, although they have received a sufficient introduction to the subject in the *Deutsch-Französische Jahrbücher* and *Die heilige Familie*). Further, it follows that every class which is struggling for mastery, even when its domination, as is the case with the proletariat, postulates the abolition of the old form of society in its entirety and of domination itself, must first conquer for itself political power in order to represent its interest in turn as the general interest, which in the first moment it is forced to do. Just because individuals seek only their particular interest, which for them does not coincide with their communal interest (in fact the general is the illusory form of communal life), the latter will be imposed on them as an interest "alien" to them, and "independent" of them as in its turn a particular, peculiar "general" interest; or they themselves must remain within this discord, as in democracy. On the other hand, too, the practical struggle of these particular interests, which constantly really run counter to the communal and illusory communal interests, makes practical intervention and control necessary through the illusory "general" interest in the form of the State.

B. The Illusion of the Epoch

Civil Society and the Conception of History

The form of intercourse determined by the existing productive forces at all previous historical stages, and in its turn determining these, is civil society. The latter, as is clear from what we have said above, has as its premises and basis the simple family and the multiple, the so-called tribe, the more precise determinants of this society are enumerated in our remarks above. Already here we see how this civil society is the true source and theatre of all history, and how absurd is the conception of history held hitherto, which neglects the real relationships and confines itself to high-sounding dramas of princes and states.

Civil society embraces the whole material intercourse of individuals within a definite stage of the development of productive forces. It embraces the whole commercial and industrial life of a given stage and, insofar, transcends the State and the nation, though, on the other hand again, it must assert itself in its foreign relations as nationality, and inwardly must organise itself as State. The word "civil society" [*bürgerliche Gesellschaft*] emerged in the eighteenth century, when property relationships had already extricated themselves from the ancient and medieval communal society. Civil society as such only develops with the bourgeoisie; the social organisation evolving directly out of production and commerce, which in all ages forms the basis of the State and of the rest of the idealistic superstructure, has, however, always been designated by the same name.

Conclusions from the Materialist Conception of History

History is nothing but the succession of the separate generations, each of which exploits the materials, the capital funds, the productive forces handed down to it by all preceding generations, and thus, on the one hand, continues the traditional activity in completely changed circumstances and, on the other, modifies the old circumstances with a completely changed activity. This can be speculatively distorted so that later history is made the goal of earlier history, e.g. the goal ascribed to the discovery of America is to further the eruption of the French Revolution. Thereby history receives its own special aims and becomes "a person rating with other persons" (to wit: "Self-Consciousness, Criticism, the Unique," etc.), while what is designated with the words "destiny," "goal," "germ," or "idea" of earlier history is nothing more than an abstraction formed from later history, from the active influence which earlier history exercises on later history.

The further the separate spheres, which interact on one another, extend in the course of this development, the more the original isolation of the separate nationalities is destroyed by the developed mode of production and intercourse and the division of labour between various nations naturally brought forth by these, the more history becomes world history. Thus, for instance, if in England a machine is invented, which deprives countless workers of bread in India and China, and overturns the whole form of existence of these empires, this invention becomes a world-historical fact. Or again, take the case of sugar and coffee which have proved their world-historical importance in the nineteenth century by the fact that the lack of these products, occasioned by the Napoleonic Continental System, caused the Germans to rise against Napoleon, and thus became the real basis of the glorious Wars of liberation of 1813. From this it follows that this transformation of history into world history is not indeed a mere abstract act on the part of the "self-consciousness," the world spirit, or of any other metaphysical spectre, but a quite material, empirically verifiable act, an act the proof of which every individual furnishes as he comes and goes, eats, drinks and clothes himself.

[7. Summary of the Materialist Conception of History]

This conception of history depends on our ability to expound the real process of production, starting out from the material production of life itself, and to comprehend the form of intercourse connected with this and created by this mode of production (i.e. civil society in its various stages), as the basis of all history; and to show it in its action as State, to explain all the different theoretical products and forms of consciousness, religion, philosophy, ethics, etc. etc. and trace their origins and growth from that basis; by which means, of course, the whole thing can be depicted in its totality (and therefore, too, the reciprocal action of these various sides on one another). It has not, like the idealistic view of history, in every period to look for a category, but remains constantly on the real ground of history; it does not explain practice from the idea but explains the formation of ideas from material practice; and accordingly it comes to the conclusion that all forms and products of consciousness cannot be dissolved by mental criticism, by resolution into "self-consciousness" or transformation into "apparitions," "spectres," "fancies," etc. but only by the practical overthrow of the actual social relations which gave rise to this idealistic humbug; that not criticism but revolution is the driving force of history, also of religion, of philosophy and all other types of theory. It shows that history does not end by being resolved into "self-consciousness as spirit of the spirit," but that in it at each stage there is found a material result: a sum of productive forces, an historically created relation of individuals to nature and to one another, which is handed down to each generation from its predecessor; a mass of productive forces, capital funds and conditions, which, on the one hand, is indeed modified by the new generation, but also on the other prescribes for it its conditions of life and gives it a definite development, a special character. It shows that circumstances make men just as much as men make circumstances.

This sum of productive forces, capital funds and social forms of intercourse, which every individual and generation finds in existence as something given, is the real basis of what the philosophers have conceived as "substance" and "essence of man," and what they have deified and attacked; a real basis which is not in the least disturbed, in its effect and influence on the development of men, by the fact that these philosophers revolt against it as "self-consciousness" and the "Unique." These conditions of life, which different generations find in existence, decide also whether or not the periodically recurring revolutionary convulsion will be strong enough to overthrow the basis of the entire existing system. And if these material elements of a complete revolution are not present (namely, on the one hand the existing productive forces, on the other the formation of a revolutionary mass, which revolts not only against separate conditions of society up till then, but against the very "production of life" till then, the "total activity" on which it was based), then, as far as practical development is concerned, it is absolutely immaterial whether the idea of this revolution has been expressed a hundred times already, as the history of communism proves.

[8. The Inconsistency of the Idealist Conception of History in General, and of German Post-Hegelian Philosophy in Particular]

In the whole conception of history up to the present this real basis of history has either been totally neglected or else considered as a minor matter quite irrelevant to the course of history. History must, therefore, always be written according to an extraneous standard; the real production of life seems to be primeval history, while the truly historical appears to be separated from ordinary life, something extra-superterrestrial. With this the relation of man to nature is excluded from history and hence the antithesis of nature and history is created. The exponents of this conception of history have consequently only been able to see in history the political actions of princes and States, religious and all sorts of theoretical struggles, and in particular in each historical epoch have had to share the illusion of that epoch. For instance, if an epoch imagines itself to be actuated by purely "political" or "religious" motives, although "religion" and "politics" are only forms of its true motives, the historian accepts this opinion. The "idea," the "conception" of the people in question about their real practice, is transformed into the sole determining, active force, which controls and determines their practice. When the crude form in which the division of labour appears with the Indians and Egyptians calls forth the caste-system in their State and religion, the historian believes that the caste-system is the power which has produced this crude social form.

While the French and the English at least hold by the political illusion, which is moderately close to reality, the Germans move in the realm of the "pure spirit," and make religious illusion the driving force of history. The Hegelian philosophy of history is the last consequence, reduced to its "finest expression," of all this German historiography, for which it is not a question of real, nor even of political, interests, but of pure thoughts, which consequently must appear to Saint Bruno as a series of "thoughts" that devour one another and are finally swallowed up in "self-consciousness." —

Marginal note by Marx: So-called objective historiography [23] consisted precisely, in treating the historical relations separately from activity. Reactionary character.

— and even more consistently the course of history must appear to Saint Max Stirner, who knows not a thing about real history, as a mere "tale of knights, robbers and ghosts,"[24] from whose visions he can, of course, only save himself by "unholiness". This conception is truly religious: it postulates religious man as the primitive man, the starting-point of history, and in its imagination puts the religious production of fancies in the place of the real production of the means of subsistence and of life itself.

This whole conception of history, together with its dissolution and the scruples and qualms resulting from it, is a purely national affair of the Germans and has merely local interest for Germany, as for instance the important question which has been under discussion in recent times: how exactly one "passes from the realm of God to the realm of Man" [Ludwig Feuerbach, *Ueber das Wesen des Christenthums*] – as if this "realm of God" had ever existed anywhere save in the imagination, and the learned gentlemen, without being aware of it, were not constantly living in the "realm of Man" to which they are now seeking the way; and as if the learned pastime (for it is nothing more) of explaining the mystery of this theoretical bubble-blowing did not on the contrary lie in demonstrating its origin in actual earthly relations. For these Germans, it is altogether simply a matter of resolving the ready-made nonsense they find into some other freak, i.e., of presupposing that all this nonsense has a special *sense* which can be discovered; while really it is only a question of explaining these theoretical phrases from the actual existing relations. The real, practical dissolution of these phrases, the removal of these notions from the consciousness of men, will, as we have already said, be effected by altered circumstances, not by theoretical deductions. For the mass of men, i.e., the proletariat, these theoretical notions do not exist and hence do not require to be dissolved, and if this mass ever had any theoretical notions, e.g., religion, these have now long been dissolved by circumstances.

The purely national character of these questions and solutions is moreover shown by the fact that these theorists believe in all seriousness that chimeras like "the God-Man," "Man," etc., have presided over individual epochs of history (Saint Bruno even goes so far as to assert that only "criticism and critics have made history," [Bruno Bauer, *Charakteristik Ludwig Feuerbachs*] and when they themselves construct historical systems, they skip over all earlier periods in the greatest haste and pass immediately from "Mongolism" [Max Stirner, *Der Einzige und sein Eigenthum*] to history "with meaningful content," that is to say, to the history, of the *Hallische and Deutsche Jahrbücher* and the dissolution of the Hegelian school into a general squabble. They forget all other nations, all real events, and the *theatrum mundi* is confined to the Leipzig book fair and the mutual quarrels of "criticism," [Bruno Bauer] "man," [Ludwig Feuerbach] and "the unique". [Max Stirner] If for once these theorists treat really historical subjects, as for instance the eighteenth century, they merely give a history of ideas, separated from the facts and the practical development underlying them; and even that merely in order to represent that period as an imperfect preliminary stage, the as yet limited predecessor of the truly historical age, i.e., the period of the German philosophic struggle from 1840 to 1844. As might be expected when the history of an earlier period is written with the aim of accentuating the brilliance of an unhistoric person and his fantasies, all the really historic events, even the really historic interventions of politics in history, receive no mention. Instead we get a narrative based not on research but on arbitrary constructions and literary gossip, such as Saint Bruno provided in his now forgotten history of the eighteenth century. [Bruno Bauer, *Geschichte der Politik, Cultur und Aufklärung des achtzehnten Jahrhunderts*] These pompous and arrogant hucksters of ideas, who imagine themselves infinitely exalted above all national prejudices, are thus in practice far more national than the beer-swilling philistines who dream of a united Germany. They do not recognise the deeds of other nations as historical; they live in Germany, within Germany 1281 and for Germany; they turn the Rhine-song [25] into a religious hymn and conquer Alsace and Lorraine by robbing French philosophy instead of the French state, by Germanising French ideas instead of French provinces. Herr Venedey is a cosmopolitan compared with the Saints Bruno and Max, who, in the universal dominance of theory, proclaim the universal dominance of Germany.

Feuerbach: Philosophic, and Real, Liberation

[...] It is also clear from these arguments how grossly Feuerbach is deceiving himself when (Wigand's *Vierteljahrsschrift*, 1845, Band 2) by virtue of the qualification "common man" he declares himself a communist,[26] transforms the latter into a predicate of "man," and thereby thinks it possible to change the word "communist," which in the real world means the follower of a definite revolutionary party, into a mere category. Feuerbach's whole deduction with regard to the relation of men to one another goes only so far as to prove that men need and always have needed each other. He wants to establish consciousness of this fact, that is to say, like the other theorists, merely to produce a correct consciousness about an existing fact; whereas for the real communist it is a question of overthrowing the existing state of things. We thoroughly appreciate, moreover, that Feuerbach, in endeavouring to produce consciousness of just this fact, is going as far as a theorist possibly can, without ceasing to be a theorist and philosopher...

As an example of Feuerbach's acceptance and at the same time misunderstanding of existing reality, which he still shares with our opponents, we recall the passage in the *Philosophie der Zukunft* where he develops the view that the existence of a thing or a man is at the same time its or his essence, that the conditions of existence, the mode of life and activity of an animal or human individual are those in which its "essence" feels itself satisfied. Here every exception is expressly conceived as an unhappy chance, as an abnormality which cannot be altered. Thus if millions of proletarians feel by no means contented with their living conditions, if their "existence" does not in the least correspond to their "essence," then, according to the passage quoted, this is an unavoidable misfortune, which must be borne quietly. The millions of proletarians and communists, however, think differently and will prove this in time, when they bring their "existence" into harmony with their "essence" in a practical way, by means of a revolution. Feuerbach, therefore, never speaks of the world of man in such cases, but always takes refuge in external nature, and moreover in nature which has not yet been subdued by men. But every new invention, every advance made by industry, detaches another piece from this domain, so that the ground which produces examples illustrating such Feuerbachian propositions is steadily shrinking.

The "essence" of the fish is its "being," water – to go no further than this one proposition. The "essence" of the freshwater fish is the water of a river. But the latter ceases to be the "essence" of the fish and is no longer a suitable medium of existence as soon as the river is made to serve industry, as soon as it is polluted by dyes and other waste products and navigated by steamboats, or as soon as its water is diverted into canals where simple drainage can deprive the fish of its medium of existence. The explanation that all such contradictions are inevitable abnormalities does not essentially differ from the consolation which Saint Max Stirner offers to the discontented, saving that this contradiction is their own contradiction and this predicament their own predicament, whereupon then, should either set their minds at ease, keep their disgust to themselves, or revolt against it in some fantastic way. It differs just as little from Saint Bruno's allegation that these unfortunate circumstances are due to the fact that those concerned are stuck in the muck of "substance," have not advanced to "absolute self-consciousness and do not realise that these adverse conditions are spirit of their spirit.

[II. 1. Preconditions of the Real Liberation of Man]

[...] We shall, of course, not take the trouble to enlighten our wise philosophers by explaining to them that the "liberation" of man is not advanced a single step by reducing philosophy, theology, substance and all the trash to "self-consciousness" and by liberating man from the domination of these phrases, which have never held him in thrall. Nor will we explain to them that it is only possible to achieve real liberation in the real world and by employing real means, that slavery cannot be abolished without the steam-engine and the mule and spinning-jenny, serfdom cannot be abolished without improved agriculture, and that, in general, people cannot be liberated as long as they are unable to obtain food and drink, housing and clothing in adequate quality and quantity. "Liberation" is an historical and not a mental act, and it is brought about by historical conditions, the development of industry, commerce, agriculture, the conditions of intercourse...[There is here a gap in the manuscript]

In Germany, a country where only a trivial historical development is taking place, these mental developments, these glorified and ineffective trivialities, naturally serve as a substitute for the lack of historical development, and they take root and have to be combated. But this fight is of local importance.

[2. Feuerbach's Contemplative and Inconsistent Materialism]

In reality and for the practical materialist, i.e. the communist, it is a question of revolutionising the existing world, of practically attacking and changing existing things. When occasionally we find such views with Feuerbach, they are never more than isolated surmises and have much too little influence on his general outlook to be considered here as anything else than embryos capable of development. Feuerbach's conception of the sensuous world is confined on the one hand to mere contemplation of it, and on the other to mere feeling; he says "Man" instead of "real historical man." "Man" is really "the German." In the first case, the contemplation of the sensuous world, he necessarily lights on things which contradict his consciousness and feeling, which disturb the harmony he presupposes, the harmony of all parts of the sensuous world and especially of man and nature. To remove this disturbance, he must take refuge in a double perception, a profane one which only perceives the "flatly obvious" and a higher, philosophical, one which perceives the "true essence" of things. He does not see how the sensuous world around him is, not a thing given direct from all eternity, remaining ever the same, but the product of industry and of the state of society; and, indeed, in the sense that it is an historical product, the result of the activity of a whole succession of generations, each standing on the shoulders of the preceding one, developing its industry and its intercourse, modifying its social system according to the changed needs. Even the objects of the simplest "sensuous certainty" are only given him through social development, industry and commercial intercourse. The cherry-tree, like almost all fruit-trees, was, as is well known, only a few centuries ago transplanted by commerce into our zone, and therefore only by this action of a definite society in a definite age it has become "sensuous certainty" for Feuerbach.

Incidentally, when we conceive things thus, as they really are and happened, every profound philosophical problem is resolved, as will be seen even more clearly later, quite simply into an empirical fact. For instance, the important question of the relation of man to nature (Bruno [Bauer] goes so far as to speak of "the antitheses in nature and history" (p. 110), as though these were two separate "things" and man did not always have before him an historical nature and a natural history) out of which all the "unfathomably lofty works" on "substance" and "self-consciousness" were born, crumbles of itself when we understand that the celebrated "unity of man with nature" has always existed in industry and has existed in varying forms in every epoch according to the lesser or greater development of industry, just like the "struggle" of man with nature, right up to the development of his productive powers on a corresponding basis. Industry and commerce, production and the exchange of the necessities of life, themselves determine distribution, the structure of the different social classes and are, in turn, determined by it as to the mode in which they are carried on; and so it happens that in Manchester, for instance, Feuerbach sees only factories and machines, where a hundred years ago only spinning-wheels and weaving-rooms were to be seen, or in the Campagna of Rome he finds only pasture lands and swamps, where in the time of Augustus he would have found nothing but the vineyards and villas of Roman capitalists. Feuerbach speaks in particular of the perception of natural science; he mentions secrets which are disclosed only to the eye of the physicist and chemist; but where would natural science be without industry and commerce? Even this pure natural science is provided with an aim, as with its material, only through trade and industry, through the sensuous activity of men. So much is this activity, this unceasing sensuous labour and creation, this production, the basis of the whole sensuous world as it now exists, that, were it interrupted only for a year, Feuerbach would not only find an enormous change in the natural world, but would very soon find that the whole world of men and his own perceptive faculty, nay his own existence, were missing. Of course, in all this the priority of external nature remains unassailed, and all this has no application to the original men produced by *generatio aequivoca* [spontaneous generation]; but this differentiation has meaning only insofar as man is considered to be distinct from nature. For that matter, nature, the nature that preceded human history, is not by any means the nature in which Feuerbach lives, it is nature which today no longer exists anywhere (except perhaps on a few Australian coral-islands of recent origin) and which, therefore, does not exist for Feuerbach.

Certainly Feuerbach has a great advantage over the "pure" materialists in that he realises how man too is an "object of the senses." But apart from the fact that he only conceives him as an "object of the senses, not as sensuous activity," because he still remains in the realm of theory and conceives of men not in their given social connection, not under their existing conditions of life, which have made them *what* they are, he never arrives at the really existing active men, but stops at the abstraction "man," and gets no further than recognising "the true, individual, corporeal man," emotionally, i.e. he knows no other "human relationships" "of man to man" than love and friendship, and even then idealised. He gives no criticism of the present conditions of life. Thus he never manages to conceive the sensuous world as the total living sensuous *activity* of the individuals composing it; and therefore when, for example, he sees instead of healthy men a crowd of scrofulous, overworked and consumptive starvelings, he is compelled to take refuge in the "higher perception" and in the ideal "compensation in the species," and thus to relapse into idealism at the very point where the communist materialist sees the necessity, and at the same time the condition, of a transformation both of industry and of the social structure.

As far as Feuerbach is a materialist he does not deal with history, and as far as he considers history he is not a materialist. With him materialism and history diverge completely, a fact which incidentally is already obvious from what has been said.

Ruling Class and Ruling Ideas

The ideas of the ruling class are in every epoch the ruling ideas, i.e. the class which is the ruling material force of society, is at the same time its ruling intellectual force. The class which has the means of material production at its disposal, has control at the same time over the means of mental production, so that thereby, generally speaking, the ideas of those who lack the means of mental production are subject to it. The ruling ideas are nothing more than the ideal expression of the dominant material relationships, the dominant material relationships grasped as ideas; hence of the relationships which make the one class the ruling one, therefore, the ideas of its dominance. The individuals composing the ruling class possess among other things consciousness, and therefore think. Insofar, therefore, as they rule as a class and determine the extent and compass of an epoch, it is self-evident that they do this in its whole range, hence among other things rule also as thinkers, as producers of ideas, and regulate the production and distribution of the ideas of their age: thus their ideas are the ruling ideas of the epoch. For instance, in an age and in a country where royal power, aristocracy, and bourgeoisie are contending for mastery and where, therefore, mastery is shared, the doctrine of the separation of powers proves to be the dominant idea and is expressed as an "eternal law."

The division of labour, which we already saw above as one of the chief forces of history up till now, manifests itself also in the ruling class as the division of mental and material labour, so that inside this class one part appears as the thinkers of the class (its active, conceptive ideologists, who make the perfecting of the illusion of the class about itself their chief source of livelihood), while the others' attitude to these ideas and illusions is more passive and receptive, because they are in reality the active members of this class and have less time to make up illusions and ideas about themselves. Within this class this cleavage can even develop into a certain opposition and hostility between the two parts, which, however, in the case of a practical collision, in which the class itself is endangered, automatically comes to nothing, in which case there also vanishes the semblance that the ruling ideas were not the ideas of the ruling class and had a power distinct from the power of this class. The existence of revolutionary ideas in a particular period presupposes the existence of a revolutionary class; about the premises for the latter sufficient has already been said above.

If now in considering the course of history we detach the ideas of the ruling class from the ruling class itself and attribute to them an independent existence, if we confine ourselves to saying that these or those ideas were dominant at a given time, without bothering ourselves about the conditions of production and the producers of these ideas, if we thus ignore the individuals and world conditions which are the source of the ideas, we can say, for instance, that during the time that the aristocracy was dominant, the concepts honour, loyalty, etc. were dominant, during the dominance of the bourgeoisie the concepts freedom, equality, etc. The ruling class itself on the whole imagines this to be so. This conception of history, which is common to all historians, particularly since the eighteenth century, will necessarily come up against the phenomenon that increasingly abstract ideas hold sway, i.e. ideas which increasingly take on the form of universality. For each new class which puts itself in the place of one ruling before it, is compelled, merely in order to carry through its aim, to represent its interest as the common interest of all the members of society, that is, expressed in ideal form: it has to give its ideas the form of universality, and represent them as the only rational, universally valid ones. The class making a revolution appears from the very start, if only because it is opposed to a class, not as a class but as the representative of the whole of society; it appears as the whole mass of society confronting the one ruling class. —

Marginal note by Marx: Universality corresponds to (1) the class versus the estate, (2) the competition, world-wide intercourse, etc., (3) the great numerical strength of the ruling class, (4) the illusion of the common interests (in the beginning this illusion is true), (5) the delusion of the ideologists and the division of labour.

— It can do this because, to start with, its interest really is more connected with the common interest of all other non-ruling classes, because under the pressure of hitherto existing conditions its interest has not yet been able to develop as the particular interest of a particular class. Its victory, therefore, benefits also many individuals of the other classes which are not winning a dominant position, but only insofar as it now puts these individuals in a position to raise themselves into the ruling class. When the French bourgeoisie overthrew the power of the aristocracy, it thereby made it possible for many proletarians to raise themselves above the proletariat, but only insofar as they become bourgeois. Every new class, therefore, achieves its hegemony only on a broader basis than that of the class ruling previously, whereas the opposition of the non-ruling class against the new ruling class later develops all the more sharply and profoundly. Both these things determine the fact that the struggle to be waged against this new ruling class, in its turn, aims at a more decided and radical negation of the previous conditions of society than could all previous classes which sought to rule.

This whole semblance, that the rule of a certain class is only the rule of certain ideas, comes to a natural end, of course, as soon as class rule in general ceases to be the form in which society is organised, that is to say, as soon as it is no longer necessary to represent a particular interest as general or the "general interest" as ruling.

Once the ruling ideas have been separated from the ruling individuals and, above all, from the relationships which result from a given stage of the mode of production, and in this way the conclusion has been reached that history is always under the sway of ideas, it is very easy to abstract from these various ideas "the idea," the notion, etc. as the dominant force in history, and thus to understand all these separate ideas and concepts as "forms of self-determination" on the part of the concept developing in history. It follows then naturally, too, that all the relationships of men can be derived from the concept of man, man as conceived, the essence of man, Man. This has been done by the speculative philosophers. Hegel himself confesses at the end of the *Geschichtsphilosophie* that he "has considered the progress of the concept only" and has represented in history the "true theodicy." (p.446.) Now one can go back again to the producers of the "concept," to the theorists, ideologists and philosophers, and one comes then to the conclusion that the philosophers, the thinkers as such, have at all times been dominant in history: a conclusion, as we see[27], already expressed by Hegel. The whole trick of proving the hegemony of the spirit in history (hierarchy Stirner calls it) is thus confined to the following three efforts.

No. 1. One must separate the ideas of those ruling for empirical reasons, under empirical conditions and as empirical individuals, from these actual rulers, and thus recognise the rule of ideas or illusions in history.

No. 2. One must bring an order into this rule of ideas, prove a mystical connection among the successive ruling ideas, which is managed by understanding them as "acts of self-determination on the part of the concept" (this is possible because by virtue of their empirical basis these ideas are really connected with one another and because, conceived as mere ideas, they become self-distinctions, distinctions made by thought).

No. 3. To remove the mystical appearance of this "self-determining concept" it is changed into a person – "Self-Consciousness" – or, to appear thoroughly materialistic, into a series of persons, who represent the "concept" in history, into the "thinkers," the "philosophers," the ideologists, who again are understood as the manufacturers of history, as the "council of guardians," as the rulers. Thus the whole body of materialistic elements has been removed from history and now full rein can be given to the speculative steed.

Whilst in ordinary life every shopkeeper is very well able to distinguish between what somebody professes to be and what he really is, our historians have not yet won even this trivial insight. They take every epoch at its word and believe that everything it says and imagines about itself is true.

This historical method which reigned in Germany, and especially the reason why, must be understood from its connection with the illusion of ideologists in general, e.g. the illusions of the jurist, politicians (of the practical statesmen among them, too), from the dogmatic dreamings and distortions of these fellows; this is explained perfectly easily from their practical position in life, their job, and the division of labour.

C. The Real Basis of Ideology

Division of Labour: Town and Country

[...] [1] From the first there follows the premise of a highly developed division of labour and an extensive commerce; from the second, the locality. In the first case the individuals must be brought together; in the second they find themselves alongside the given instrument of production as instruments of production themselves. Here, therefore, arises the difference between natural instruments of production and those created by civilisation. The field (water, etc.) can be regarded as a natural instrument of production. In the first case, that of the natural instrument of production, individuals are subservient to nature; in the second, to a product of labour. In the first case, therefore, property (landed property) appears as direct natural domination, in the second, as domination of labour, particularly of accumulated labour, capital. The first case presupposes that the individuals are united by some bond: family, tribe, the land itself, etc.; the second, that they are independent of one another and are only held together by exchange. In the first case, what is involved is chiefly an exchange between men and nature in which the labour of the former is exchanged for the products of the latter; in the second, it is predominantly an exchange of men among themselves. In the first case, average, human common sense is adequate — physical activity is as yet not separated from mental activity; in the second, the division between physical and mental labour must already be practically completed. In the first case, the domination of the proprietor over the propertyless may be based on a personal relationship, on a kind of community; in the second, it must have taken on a material shape in a third party - money. In the first case, small industry exists, but determined by the utilisation of the natural instrument of production and therefore without the distribution of labour among various individuals; in the second, industry exists only in and through the division of labour.

[2. The Division of Material and Mental Labour. Separation of Town and Country, The Guild System]

The greatest division of material and mental labour is the separation of town and country. The antagonism between town and country begins with the transition from barbarism to civilisation, from tribe to State, from locality to nation, and runs through the whole history of civilisation to the present day (the Anti-Corn Law League).

The existence of the town implies, at the same time, the necessity of administration, police, taxes, etc.; in short, of the municipality, and thus of politics in general. Here first became manifest the division of the population into two great classes, which is directly based on the division of labour and on the instruments of production. The town already is in actual fact the concentration of the population, of the instruments of production, of capital, of pleasures, of needs, while the country demonstrates just the opposite fact, isolation and separation. The antagonism between town and country can only exist within the framework of private property. It is the most crass expression of the subjection of the individual under the division of labour, under a definite activity forced upon him — a subjection which makes one man into a restricted town-animal, the other into a restricted country-animal, and daily creates anew the conflict between their interests. Labour is here again the chief thing, power over individuals, and as long as the latter exists, private property must exist. The abolition of the antagonism between town and country is one of the first conditions of communal life, a condition which again depends on a mass of material premises and which cannot be fulfilled by the mere will, as anyone can see at the first glance. (These conditions have still to be enumerated.) The separation of town and country can also be understood as the separation of capital and landed property, as the beginning of the existence and development of capital independent of landed property — the beginning of property having its basis only in labour and exchange.

In the towns which, in the Middle Ages, did not derive ready-made from an earlier period but were formed anew by the serfs who had become free, each man's own particular labour was his only property apart from the small capital he brought with him, consisting almost solely of the most necessary tools of his craft. The competition of serfs constantly escaping into the town, the constant war of the country against the towns and thus the necessity of an organised municipal military force, the bond of common ownership in a particular kind of labour, the necessity of common buildings for the sale of their wares at a time when craftsmen were also traders, and the consequent exclusion of the unauthorised from these buildings, the conflict among the interests of the various crafts, the necessity of protecting their laboriously acquired skill, and the feudal organisation of the whole of the country: these were the causes of the union of the workers of each craft in guilds. We have not at this point to go further into the manifold modifications of the guild-system, which arise through later historical developments. The flight of the serfs into the towns went on without interruption right through the Middle Ages. These serfs, persecuted by their lords in the country, came separately into the towns, where they found an organised community, against which they were powerless and in which they had to subject themselves to the station assigned to them by the demand for their labour and the interest of their organised urban competitors. These workers, entering separately, were never able to attain to any power, since, if their labour was of the guild type which had to be learned, the guild-masters bent them to their will and organised them according to their interest; or if their labour was not such as had to be learned, and therefore not of the guild type, they became day-labourers and never managed to organise, remaining an unorganised rabble. The need for day-labourers in the towns created the rabble.

These towns were true "associations", called forth by the direct need, the care of providing for the protection of property, and of multiplying the means of production and defence of the separate members. The rabble of these towns was devoid of any power, composed as it was of individuals strange to one another who had entered separately, and who stood unorganised over against an organised power, armed for war, and jealously watching over them. The journeymen and apprentices were organised in each craft as it best suited the interest of the masters. The patriarchal relationship existing between them and their masters gave the latter a double power — on the one hand because of their influence on the whole life of the journeymen, and on the other because, for the journeymen who worked with the same master, it was a real bond which held them together against the journeymen of other masters and separated them from these. And finally, the journeymen were bound to the existing order by their simple interest in becoming masters themselves. While, therefore, the rabble at least carried out revolts against the whole municipal order, revolts which remained completely ineffective because of their powerlessness, the journeymen never got further than small acts of insubordination within separate guilds, such as belong to the very nature of the guild-system. The great risings of the Middle Ages all radiated from the country, but equally remained totally ineffective because of the isolation and consequent crudity of the peasants.

In the towns, the division of labour between the individual guilds was as yet [quite naturally derived] and, in the guilds themselves, not at all developed between the individual workers. Every workman had to be versed in a whole round of tasks, had to be able to make everything that was to be made with his tools. The limited commerce and the scanty communication between the individual towns, the lack of population and the narrow needs did not allow of a higher division of labour, and therefore every man who wished to become a master had to be proficient in the whole of his craft. Thus there is found with medieval craftsmen an interest in their special work and in proficiency in it, which was capable of rising to a narrow artistic sense. For this very reason, however, every medieval craftsman was completely absorbed in his work, to which he had a contented, slavish relationship, and to which he was subjected to a far greater extent than the modern worker, whose work is a matter of indifference to him.

Capital in these towns was a naturally derived capital, consisting of a house, the tools of the craft, and the natural, hereditary customers; and not being realisable, on account of the backwardness of commerce and the lack of circulation, it descended from father to son. Unlike modern capital, which can be assessed in money and which may be indifferently invested in this thing or that, this capital was directly connected with the particular work of the owner, inseparable from it and to this extent estate capital.

Further Division of Labour

The next extension of the division of labour was the separation of production and commerce, the formation of a special class of merchants; a separation which, in the towns bequeathed by a former period, had been handed down (among other things with the Jews) and which very soon appeared in the newly formed ones. With this there was given the possibility of commercial communications transcending the immediate neighbourhood, a possibility, the realisation of which depended on the existing means of communication, the state of public safety in the countryside, which was determined by political conditions (during the whole of the Middle Ages, as is well known, the merchants travelled in armed caravans), and on the cruder or more advanced needs (determined by the stage of culture attained) of the region accessible to intercourse.

With commerce the prerogative of a particular class, with the extension of trade through the merchants beyond the immediate surroundings of the town, there immediately appears a reciprocal action between production and commerce. The towns enter into relations with one another, new tools are brought from one town into the other, and the separation between production and commerce soon calls forth a new division of production between the individual towns, each of which is soon exploiting a predominant branch of industry. The local restrictions of earlier times begin gradually to be broken down.

It depends purely on the extension of commerce whether the productive forces achieved in a locality, especially inventions, are lost for later development or not. As long as there exists no commerce transcending the immediate neighbourhood, every invention must be made separately in each locality, and mere chances such as irruptions of barbaric peoples, even ordinary wars, are sufficient to cause a country with advanced productive forces and needs to have to start right over again from the beginning. In primitive history every invention had to be made daily anew and in each locality independently. How little highly developed productive forces are safe from complete destruction, given even a relatively very extensive commerce, is proved by the Phoenicians, whose inventions were for the most part lost for a long time to come through the ousting of this nation from commerce, its conquest by Alexander and its consequent decline. Likewise, for instance, glass-painting in the Middle Ages. Only when commerce has become world commerce and has as its basis large-scale industry, when all nations are drawn into the competitive struggle, is the permanence of the acquired productive forces assured.

The Rise of Manufacturing

The immediate consequence of the division of labour between the various towns was the rise of manufactures, branches of production which had outgrown the guild-system. Manufactures first flourished, in Italy and later in Flanders, under the historical premise of commerce with foreign nations. In other countries, England and France for example, manufactures were at first confined to the home market. Besides the premises already mentioned manufactures depend on an already advanced concentration of population, particularly in the countryside, and of capital, which began to accumulate in the hands of individuals, partly in the guilds in spite of the guild regulations, partly among the merchants.

That labour which from the first presupposed a machine, even of the crudest sort, soon showed itself the most capable of development. Weaving, earlier carried on in the country by the peasants as a secondary occupation to procure their clothing, was the first labour to receive an impetus and a further development through the extension of commerce. Weaving was the first and remained the principal manufacture. The rising demand for clothing materials, consequent on the growth of population, the growing accumulation and mobilisation of natural capital through accelerated circulation, the demand for luxuries called forth by the latter and favoured generally by the gradual extension of commerce, gave weaving a quantitative and qualitative stimulus, which wrenched it out of the form of production hitherto existing. Alongside the peasants weaving for their own use, who continued, and still continue, with this sort of work, there emerged a new class of weavers in the towns, whose fabrics were destined for the whole home market and usually for foreign markets too.

Weaving, an occupation demanding in most cases little skill and soon splitting up into countless branches, by its whole nature resisted the trammels of the guild. Weaving was, therefore, carried on mostly in villages and market-centres without guild organisation, which gradually became towns, and indeed the most flourishing towns in each land.

With guild-free manufacture, property relations also quickly changed. The first advance beyond naturally derived estate capital was provided by the rise of merchants whose capital was from the beginning movable, capital in the modern sense as far as one can speak of it, given the circumstances of those times. The second advance came with manufacture, which again made mobile a mass of natural capital, and altogether increased the mass of movable capital as against that of natural capital.

At the same time, manufacture became a refuge of the peasants from the guilds which excluded them or paid them badly, just as earlier the guild-towns had [served] as a refuge for the peasants from [the oppressive landed nobility].

Simultaneously with the beginning of manufactures there was a period of vagabondage caused by the abolition of the feudal bodies of retainers, the disbanding of the swollen armies which had flocked to serve the kings against their vassals, the improvement of agriculture, and the transformation of great strips of tillage into pasture land. From this alone it is clear how this vagabondage is strictly connected with the disintegration of the feudal system. As early as the thirteenth century we find isolated epochs of this kind, but only at the end of the fifteenth and beginning of the sixteenth does this vagabondage make a general and permanent appearance. These vagabonds, who were so numerous that, for instance, Henry VIII of England had 72,000 of them hanged, were only prevailed upon to work with the greatest difficulty and through the most extreme necessity, and then only after long resistance. The rapid rise of manufactures, particularly in England, absorbed them gradually.

With the advent of manufactures, the various nations entered into a competitive relationship, the struggle for trade, which was fought out in wars, protective duties and prohibitions, whereas earlier the nations, insofar as they were connected at all, had carried on an inoffensive exchange with each other. Trade had from now on a political significance.

With the advent of manufacture the relationship between worker and employer changed. In the guilds the patriarchal relationship between journeyman and master continued to exist; in manufacture its place was taken by the monetary relation between worker and capitalist — a relationship which in the countryside and in small towns retained a patriarchal tinge, but in the larger, the real manufacturing towns, quite early lost almost all patriarchal complexion.

Manufacture and the movement of production in general received an enormous impetus through the extension of commerce which came with the discovery of America and the sea-route to the East Indies. The new products imported thence, particularly the masses of gold and silver which came into circulation and totally changed the position of the classes towards one another, dealing a hard blow to feudal landed property and to the workers; the expeditions of adventurers, colonisation; and above all the extension of markets into a world market, which had now become possible and was daily becoming more and more a fact, called forth a new phase of historical development, into which in general we cannot here enter further. Through the colonisation of the newly discovered countries the commercial struggle of the nations amongst one another was given new fuel and accordingly greater extension and animosity.

The expansion of trade and manufacture accelerated the accumulation of movable capital, while in the guilds, which were not stimulated to extend their production, natural capital remained stationary or even declined. Trade and manufacture created the big bourgeoisie; in the guilds was concentrated the petty bourgeoisie, which no longer was dominant in the towns as formerly, but had to bow to the might of the great merchants and manufacturers. Hence the decline of the guilds, as soon as they came into contact with manufacture.

The intercourse of nations took on, in the epoch of which we have been speaking, two different forms. At first the small quantity of gold and silver in circulation involved the ban on the export of these metals; and industry, for the most part imported from abroad and made necessary by the need for employing the growing urban population, could not do without those privileges which could be granted not only, of course, against home competition, but chiefly against foreign. The local guild privilege was in these original prohibitions extended over the whole nation. Customs duties originated from the tributes which the feudal lords exacted as protective levies against robbery from merchants passing through their territories, tributes later imposed likewise by the towns, and which, with the rise of the modern states, were the Treasury's most obvious means of raising money.

The appearance of American gold and silver on the European markets, the gradual development of industry, the rapid expansion of trade and the consequent rise of the non-guild bourgeoisie and of money, gave these measures another significance. The State, which was daily less and less able to do without money, now retained the ban on the export of gold and silver out of fiscal considerations; the bourgeois, for whom these masses of money which were hurled onto the market became the chief object of speculative buying, were thoroughly content with this; privileges established earlier became a source of income for the government and were sold for money; in the customs legislation there appeared the export duty, which, since it only [placed] a hindrance in the way of industry, had a purely fiscal aim.

The second period began in the middle of the seventeenth century and lasted almost to the end of the eighteenth. Commerce and navigation had expanded more rapidly than manufacture, which played a secondary role; the colonies were becoming considerable consumers; and after long struggles the separate nations shared out the opening world market among themselves. This period begins with the Navigation Laws [2] and colonial monopolies. The competition of the nations among themselves was excluded as far as possible by tariffs, prohibitions and treaties; and in the last resort the competitive struggle was carried on and decided by wars (especially naval wars). The mightiest maritime nation, the English, retained preponderance in trade and manufacture. Here, already, we find concentration in one country.

Manufacture was all the time sheltered by protective duties in the home market, by monopolies in the colonial market, and abroad as much as possible by differential duties. The working-up of home-produced material was encouraged (wool and linen in England, silk in France), the export of home-produced raw material forbidden (wool in England), and the [working-up] of imported material neglected or suppressed (cotton in England). The nation dominant in sea trade and colonial power naturally secured for itself also the greatest quantitative and qualitative expansion of manufacture. Manufacture could not be carried on without protection, since, if the slightest change takes place in other countries, it can lose its market and be ruined; under reasonably favourable conditions it may easily be introduced into a country, but for this very reason can easily be destroyed. At the same time through the mode in which it is carried on, particularly in the eighteenth century, in the countryside, it is to such an extent interwoven with the vital relationships of a great mass of individuals, that no country dare jeopardise its existence by permitting free competition. Insofar as it manages to export, it therefore depends entirely on the extension or restriction of commerce, and exercises a relatively very small reaction [on the latter]. Hence its secondary [importance] and the influence of [the merchants] in the eighteenth century. It was the merchants and especially the shippers who more than anybody else pressed for State protection and monopolies; the manufacturers also demanded and indeed received protection, but all the time were inferior in political importance to the merchants. The commercial towns, particularly the maritime towns, became to some extent civilised and acquired the outlook of the big bourgeoisie, but in the factory towns an extreme petty-bourgeois outlook persisted. Cf Aikin, [3] etc. The eighteenth century was the century of trade. Pinto says this expressly: "*Le commerce fait la marotte du siècle*" ; and: "*Depuis quelque temps il n'est plus question que de commerce, de navgation et de marine*." ["Commerce is the rage of the century." "For some time now people have been talking only about commerce, navigation and the navy." - Ed.]

This period is also characterised by the cessation of the bans on the export of gold and silver and the beginning of the trade in money; by banks, national debts, paper money; by speculation in stocks and shares and stockjobbing in all articles; by the development of finance in general. Again capital lost a great part of the natural character which had still clung to it.

[4. Most Extensive Division of Labour. Large-Scale Industry]

The concentration of trade and manufacture in one country, England, developing irresistibly in the seventeenth century, gradually created for this country a relative world market, and thus a demand for the manufactured products of this country, which could no longer be met by the industrial productive forces hitherto existing. This demand, outgrowing the productive forces, was the motive power which, by producing big industry — the application of elemental forces to industrial ends, machinery and the most complex division of labour — called into existence the third period of private ownership since the Middle Ages. There already existed in England the other pre-conditions of this new phase: freedom of competition inside the nation, the development of theoretical mechanics, etc. (Indeed, the science of mechanics perfected by Newton was altogether the most popular science in France and England in the eighteenth century.) (Free competition inside the nation itself had everywhere to be conquered by a revolution — 1640 and 1688 in England, 1789 in France.)

Competition soon compelled every country that wished to retain its historical role to protect its manufactures by renewed customs regulations (the old duties were no longer any good against big industry) and soon after to introduce big industry under protective duties. Big industry universalised competition in spite of these protective measures (it is practical free trade; the protective duty is only a palliative, a measure of defence within free trade), established means of communication and the modern world market, subordinated trade to itself, transformed all capital into industrial capital, and thus produced the rapid circulation (development of the financial system) and the centralisation of capital. By universal competition it forced all individuals to strain their energy to the utmost. It destroyed as far as possible ideology, religion, morality, etc. and where it could not do this, made them into a palpable lie. It produced world history for the first time, insofar as it made all civilised nations and every individual member of them dependent for the satisfaction of their wants on the whole world, thus destroying the former natural exclusiveness of separate nations. It made natural science subservient to capital and took from the division of labour the last semblance of its natural character. It destroyed natural growth in general, as far as this is possible while labour exists, and resolved all natural relationships into money relationships. In the place of naturally grown towns it created the modern, large industrial cities which have sprung up overnight. Wherever it penetrated, it destroyed the crafts and all earlier stages of industry. It completed the victory of the commercial town over the countryside. [Its first premise] was the automatic system. [Its development] produced a mass of productive forces, for which private [property] became just as much a fetter as the guild had been for manufacture and the small, rural workshop for the developing craft. These productive forces received under the system of private property a one-sided development only, and became for the majority destructive forces; moreover, a great multitude of such forces could find no application at all within this system. Generally speaking, big industry created everywhere the same relations between the classes of society, and thus destroyed the peculiar individuality of the various nationalities. And finally, while the bourgeoisie of each nation still retained separate national interests, big industry created a class, which in all nations has the same interest and with which nationality is already dead; a class which is really rid of all the old world and at the same time stands pitted against it. Big industry makes for the worker not only the relation to the capitalist, but labour itself, unbearable.

It is evident that big industry does not reach the same level of development in all districts of a country. This does not, however, retard the class movement of the proletariat, because the proletarians created by big industry assume leadership of this movement and carry the whole mass along with them, and because the workers excluded from big industry are placed by it in a still worse situation than the workers in big industry itself. The countries in which big industry is developed act in a similar manner upon the more or less non-industrial countries, insofar as the latter are swept by universal commerce into the universal competitive struggle. [4]

These different forms are just so many forms of the organisation of labour, and hence of property. In each period a unification of the existing productive forces takes place, insofar as this has been rendered necessary by needs.

The Relation of State and Law to Property

The first form of property, in the ancient world as in the Middle Ages, is tribal property, determined with the Romans chiefly by war, with the Germans by the rearing of cattle. In the case of the ancient peoples, since several tribes live together in one town, the tribal property appears as State property, and the right of the individual to it as mere "possession" which, however, like tribal property as a whole, is confined to landed property only. Real private property began with the ancients, as with modern nations, with movable property. — (Slavery and community) (*dominium ex jure Quiritum* [5]). In the case of the nations which grew out of the Middle Ages, tribal property evolved through various stages — feudal landed property, corporative movable property, capital invested in manufacture — to modern capital, determined by big industry and universal competition, i.e. pure private property, which has cast off all semblance of a communal institution and has shut out the State from any influence on the development of property. To this modern private property corresponds the modern State, which, purchased gradually by the owners of property by means of taxation, has fallen entirely into their hands through the national debt, and its existence has become wholly dependent on the commercial credit which the owners of property, the bourgeois, extend to it, as reflected in the rise and fall of State funds on the stock exchange. By the mere fact that it is a class and no longer an estate, the bourgeoisie is forced to organise itself no longer locally, but nationally, and to give a general form to its mean average interest. Through the emancipation of private property from the community, the State has become a separate entity, beside and outside civil society; but it is nothing more than the form of organisation which the bourgeois necessarily adopt both for internal and external purposes, for the mutual guarantee of their property and interests. The independence of the State is only found nowadays in those countries where the estates have not yet completely developed into classes, where the estates, done away with in more advanced countries, still have a part to play, and where there exists a mixture; countries, that is to say, in which no one section of the population can achieve dominance over the others. This is the case particularly in Germany. The most perfect example of the modern State is North America. The modern French, English and American writers all express the opinion that the State exists only for the sake of private property, so that this fact has penetrated into the consciousness of the normal man.

Since the State is the form in which the individuals of a ruling class assert their common interests, and in which the whole civil society of an epoch is epitomised, it follows that the State mediates in the formation of all common institutions and that the institutions receive a political form. Hence the illusion that law is based on the will, and indeed on the will divorced from its real basis — on free will. Similarly, justice is in its turn reduced to the actual laws.

Civil law develops simultaneously with private property out of the disintegration of the natural community. With the Romans the development of private property and civil law had no further industrial and commercial consequences, because their whole mode of production did not alter. (Usury!)

With modern peoples, where the feudal community was disintegrated by industry and trade, there began with the rise of private property and civil law a new phase, which was capable of further development. The very first town which carried on an extensive maritime trade in the Middle Ages, Amalfi, also developed maritime law. As soon as industry and trade developed private property further, first in Italy and later in other countries, the highly developed Roman civil law was immediately adopted again and raised, to authority. When later the bourgeoisie had acquired so much power that the princes took up its interests in order to overthrow the feudal nobility by means of the bourgeoisie, there began in all countries — in France in the sixteenth century — the real development of law, which in all countries except England proceeded on the basis of the Roman Codex. In England, too, Roman legal principles had to be introduced to further the development of civil law (especially in the case of movable property). (It must not be forgotten that law has just as little an independent history as religion.)

In civil law the existing property relationships are declared to be the result of the general will. The *jus utendi et abutendi* [6] itself asserts on the one hand the fact that private property has become entirely independent of the community, and on the other the illusion that private property itself is based solely on the private will, the arbitrary disposal of the thing. In practice, the abuti has very definite economic limitations for the owner of private property, if he does not wish to see his property and hence his *jus abutendi* pass into other hands, since actually the thing, considered merely with reference to his will, is not a thing at all, but only becomes a thing, true property in intercourse, and independently of the law (a relationship, which the philosophers call an idea). This juridical illusion, which reduces law to the mere will, necessarily leads, in the further development of property relationships, to the position that a man may have a legal title to a thing without really having the thing. If, for instance, the income from a piece of land is lost owing to competition, then the proprietor has certainly his legal title to it along with the *jus utendi et abutendi*. But he can do nothing with it: he owns nothing as a landed proprietor if in addition he has not enough capital to cultivate his ground. This illusion of the jurists also explains the fact that for them, as for every code, it is altogether fortuitous that individuals enter into relationships among themselves (e.g. contracts); it explains why they consider that these relationships [can] be entered into or not at will, and that their content rests purely on the individual [free] will of the contracting parties.

Whenever, through the development of industry and commerce, new forms of intercourse have been evolved (e.g. assurance companies, etc.), the law has always been compelled to admit them among the modes of acquiring property.

12. FORMS OF SOCIAL CONSCIOUSNESS

Notes, written by Marx, intended for further elaboration

The influence of the division of labour on science.

The role of *repression* with regard to the state, law, morality, etc.

It is precisely because the bourgeoisie rules as a class that in the law it must give itself a general expression.

Natural science and history.

There is no history of politics, law, science, etc., of art, religion, etc.

[Marginal note by Marx:] To the "community" as it appears in the ancient state, in feudalism and in the absolute monarchy, to this bond correspond especially the religious conceptions.

Why the ideologists turn everything upside-down.

Clerics, jurists, politicians.

Jurists, politicians (statesmen in general), moralists, clerics.

For this ideological subdivision within a class: 1) *The occupation assumes an independent existence owing to division of labour.* Everyone believes his craft to be the true one. Illusions regarding the connection between their craft and reality are the more likely to be cherished by them because of the very nature of the craft. In consciousness — in jurisprudence, politics, etc. — relations become concepts; since they do not go beyond these relations, the concepts of the relations also become fixed concepts in their mind. The judge, for example, applies the code, he therefore regards legislation as the real, active driving force. Respect for their goods, because their craft deals with general matters.

Idea of law. Idea of state. The matter is turned upside-down in *ordinary* consciousness.

Religion is from the outset *consciousness of the transcendental* arising from actually existing forces.

This more popularly.

Tradition, with regard to law, religion, etc.

Individuals always proceeded, and always proceed, from themselves. Their relations are the relations of their real life-process. How does it happen that their relations assume an independent existence over against them? and that the forces of their own life become superior to them?

In short: division of labour, the level of which depends on the development of the productive power at any particular time.

Landed property. Communal property. Feudal. Modern.

Estate property. Manufacturing property. Industrial capital.

Footnotes

1. Four pages of the manuscript are missing here. - Ed.

2. Navigation Laws — a series of Acts passed in England from 1381 onwards to protect English shipping against foreign companies. The Navigation Laws were modified in the early nineteenth century and repealed in 1849 except for a reservation regarding coasting trade, which was revoked in 1854.

3. The movement of capital, although considerably accelerated, still remained, however, relatively slow. The splitting-up of the world market into separate parts, each of which was exploited by a particular nation, the exclusion of competition among themselves on the part of the nations, the clumsiness of production itself and the fact that finance was only evolving from its early stages, greatly impeded circulation. The consequence of this was a haggling, mean and niggardly spirit which still clung to all merchants and to the whole mode of carrying on trade. Compared with the manufacturers, and above all with the craftsmen, they were certainly big bourgeois; compared with the merchants and industrialists of the next period they remain petty bourgeois. Cf. Adam Smith.

[6. Competition of Individuals and the Formation of Classes]

4. Competition separates individuals from one another, not only the bourgeois but still more the workers, in spite of the fact that it brings them together. Hence it is a long time before these individuals can unite, apart from the fact that for the purposes of this union — if it is not to be merely local — the necessary means, the great industrial cities and cheap and quick communications, have first to be produced by big industry. Hence every organised power standing over against these isolated individuals, who live in relationships, daily reproducing this isolation, can only be overcome after long struggles. To demand the opposite would be tantamount to demanding that competition should not exist in this definite epoch of history, or that the individuals should banish from their minds relationships over which in their isolation they have no control.

D. Proletarians and Communism

Individuals, Class, and Community

In the Middle Ages the citizens in each town were compelled to unite against the landed nobility to save their skins. The extension of trade, the establishment of communications, led the separate towns to get to know other towns, which had asserted the same interests in the struggle with the same antagonist. Out of the many local corporations of burghers there arose only gradually the burgher class. The conditions of life of the individual burghers became, on account of their contradiction to the existing relationships and of the mode of labour determined by these, conditions which were common to them all and independent of each individual. The burghers had created the conditions insofar as they had torn themselves free from feudal ties, and were created by them insofar as they were determined by their antagonism to the feudal system which they found in existence. When the individual towns began to enter into associations, these common conditions developed into class conditions. The same conditions, the same contradiction, the same interests necessarily called forth on the whole similar customs everywhere. The bourgeoisie itself with its conditions, develops only gradually, splits according to the division of labour into various fractions and finally absorbs all propertied classes it finds in existence [1] (while it develops the majority of the earlier propertyless and a part of the hitherto propertied classes into a new class, the proletariat) in the measure to which all property found in existence is transformed into industrial or commercial capital. The separate individuals form a class only insofar as they have to carry on a common battle against another class; otherwise they are on hostile terms with each other as competitors. On the other hand, the class in its turn achieves an independent existence over against the individuals, so that the latter find their conditions of existence predestined, and hence have their position in life and their personal development assigned to them by their class, become subsumed under it. This is the same phenomenon as the subjection of the separate individuals to the division of labour and can only be removed by the abolition of private property and of labour itself. We have already indicated several times how this subsuming of individuals under the class brings with it their subjection to all kinds of ideas, etc.

If from a philosophical point of view one considers this evolution of individuals in the common conditions of existence of estates and classes, which followed on one another, and in the accompanying general conceptions forced upon them, it is certainly very easy to imagine that in these individuals the species, or "Man", has evolved, or that they evolved "Man" — and in this way one can give history some hard clouts on the ear. [2] One can conceive these various estates and classes to be specific terms of the general expression, subordinate varieties of the species, or evolutionary phases of "Man".

This subsuming of individuals under definite classes cannot be abolished until a class has taken shape, which has no longer any particular class interest to assert against the ruling class.

The transformation, through the division of labour, of personal powers (relationships) into material powers, cannot be dispelled by dismissing the general idea of it from one's mind, but can only be abolished by the individuals again subjecting these material powers to themselves and abolishing the division of labour. This is not possible without the community. Only in community [with others has each] individual the means of cultivating his gifts in all directions; only in the community, therefore, is personal freedom possible. In the previous substitutes for the community, in the State, etc. personal freedom has existed only for the individuals who developed within the relationships of the ruling class, and only insofar as they were individuals of this class. The illusory community, in which individuals have up till now combined, always took on an independent existence in relation to them, and was at the same time, since it was the combination of one class over against another, not only a completely illusory community, but a new fetter as well. In a real community the individuals obtain their freedom in and through their association.

Individuals have always built on themselves, but naturally on themselves within their given historical conditions and relationships, not on the "pure" individual in the sense of the ideologists. But in the course of historical evolution, and precisely through the inevitable fact that within the division of labour social relationships take on an independent existence, there appears a division within the life of each individual, insofar as it is personal and insofar as it is determined by some branch of labour and the conditions pertaining to it. (We do not mean it to be understood from this that, for example, the rentier, the capitalist, etc. cease to be persons; but their personality is conditioned and determined by quite definite class relationships, and the division appears only in their opposition to another class and, for themselves, only when they go bankrupt.) In the estate (and even more in the tribe) this is as yet concealed: for instance, a nobleman always remains a nobleman, a commoner always a commoner, apart from his other relationships, a quality inseparable from his individuality. The division between the personal and the class individual, the accidental nature of the conditions of life for the individual, appears only with the emergence of the class, which is itself a product of the bourgeoisie. This accidental character is only engendered and developed by competition and the struggle of individuals among themselves. Thus, in imagination, individuals seem freer under the dominance of the bourgeoisie than before, because their conditions of life seem accidental; in reality, of course, they are less free, because they are more subjected to the violence of things. The difference from the estate comes out particularly in the antagonism between the bourgeoisie and the proletariat. When the estate of the urban burghers, the corporations, etc. emerged in opposition to the landed nobility, their condition of existence — movable property and craft labour, which had already existed latently before their separation from the feudal ties — appeared as something positive, which was asserted against feudal landed property, and, therefore, in its own way at first took on a feudal form. Certainly the refugee serfs treated their previous servitude as something accidental to their personality. But here they only were doing what every class that is freeing itself from a fetter does; and they did not free themselves as a class but separately. Moreover, they did not rise above the system of estates, but only formed a new estate, retaining their previous mode of labour even in their new situation, and developing it further by freeing it from its earlier fetters, which no longer corresponded to the development already attained. [3]

For the proletarians, on the other hand, the condition of their existence, labour, and with it all the conditions of existence governing modern society, have become something accidental, something over which they, as separate individuals, have no control, and over which no social organisation can give them control. The contradiction between the individuality of each separate proletarian and labour, the condition of life forced upon him, becomes evident to him himself, for he is sacrificed from youth upwards and, within his own class, has no chance of arriving at the conditions which would place him in the other class.

Thus, while the refugee serfs only wished to be free to develop and assert those conditions of existence which were already there, and hence, in the end, only arrived at free labour, the proletarians, if they are to assert themselves as individuals, will have to abolish the very condition of their existence hitherto (which has, moreover, been that of all society up to the present), namely, labour. Thus they find themselves directly opposed to the form in which, hitherto, the individuals, of which society consists, have given themselves collective expression, that is, the State. In order, therefore, to assert themselves as individuals, they must overthrow the State.

It follows from all we have been saying up till now that the communal relationship into which the individuals of a class entered, and which was determined by their common interests over against a third party, was always a community to which these individuals belonged only as average individuals, only insofar as they lived within the conditions of existence of their class — a relationship in which they participated not as individuals but as members of a class. With the community of revolutionary proletarians, on the other hand, who take their conditions of existence and those of all members of society under their control, it is just the reverse; it is as individuals that the individuals participate in it. It is just this combination of individuals (assuming the advanced stage of modern productive forces, of course) which puts the conditions of the free development and movement of individuals under their control — conditions which were previously abandoned to chance and had won an independent existence over against the separate individuals just because of their separation as individuals, and because of the necessity of their combination which had been determined by the division of labour, and through their separation had become a bond alien to them. Combination up till now (by no means an arbitrary one, such as is expounded for example in the *Contrat social*, but a necessary one) was an agreement upon these conditions, within which the individuals were free to enjoy the freaks of fortune (compare, e.g., the formation of the North American State and the South American republics). This right to the undisturbed enjoyment, within certain conditions, of fortuity and chance has up till now been called personal freedom. These conditions of existence are, of course, only the productive forces and forms of intercourse at any particular time.

Forms of Intercourse

Communism differs from all previous movements in that it overturns the basis of all earlier relations of production and intercourse, and for the first time consciously treats all natural premises as the creatures of hitherto existing men, strips them of their natural character and subjugates them to the power of the united individuals. Its organisation is, therefore, essentially economic, the material production of the conditions of this unity; it turns existing conditions into conditions of unity. The reality, which communism is creating, is precisely the true basis for rendering it impossible that anything should exist independently of individuals, insofar as reality is only a product of the preceding intercourse of individuals themselves. Thus the communists in practice treat the conditions created up to now by production and intercourse as inorganic conditions, without, however, imagining that it was the plan or the destiny of previous generations to give them material, and without believing that these conditions were inorganic for the individuals creating them.

Contradiction between individuals and their conditions of life as contradiction between productive forces and the form of intercourse

The difference between the individual as a person and what is accidental to him, is not a conceptual difference but an historical fact. This distinction has a different significance at different times — e.g. the estate as something accidental to the individual in the eighteenth century, the family more or less too. It is not a distinction that we have to make for each age, but one which each age makes itself from among the different elements which it finds in existence, and indeed not according to any theory, but compelled by material collisions in life.

What appears accidental to the later age as opposed to the earlier — and this applies also to the elements handed down by an earlier age — is a form of intercourse which corresponded to a definite stage of development of the productive forces. The relation of the productive forces to the form of intercourse is the relation of the form of intercourse to the occupation or activity of the individuals. (The fundamental form of this activity is, of course, material, on which depend all other forms - mental, political, religious, etc. The various shaping of material life is, of course, in every case dependent on the needs which are already developed, and the production, as well as the satisfaction, of these needs is an historical process, which is not found in the case of a sheep or a dog (Stirner's refractory principal argument *adversus hominem*), although sheep and dogs in their present form certainly, but *malgré eux,* are products of an historical process.) The conditions under which individuals have intercourse with each other, so long as the above-mentioned contradiction is absent, are conditions appertaining to their individuality, in no way external to them; conditions under which these definite individuals, living under definite relationships, can alone produce their material life and what is connected with it, are thus the conditions of their self-activity and are produced by this self-activity. The definite condition under which they produce, thus corresponds, as long as the contradiction has not yet appeared, to the reality of their conditioned nature, their one-sided existence, the one-sidedness of which only becomes evident when the contradiction enters on the scene and thus exists for the later individuals. Then this condition appears as an accidental fetter, and the consciousness that it is a fetter is imputed to the earlier age as well.

These various conditions, which appear first as conditions of self-activity, later as fetters upon it, form in the whole evolution of history a coherent series of forms of intercourse, the coherence of which consists in this: in the place of an earlier form of intercourse, which has become a fetter, a new one is put, corresponding to the more developed productive forces and, hence, to the advanced mode of the self-activity of individuals - a form which in its turn becomes a fetter and is then replaced by another. Since these conditions correspond at every stage to the simultaneous development of the productive forces, their history is at the same time the history of the evolving productive forces taken over by each new generation, and is, therefore, the history of the development of the forces of the individuals themselves.

Since this evolution takes place naturally, i.e. is not subordinated to a general plan of freely combined individuals, it proceeds from various localities, tribes, nations, branches of labour, etc. each of which to start with develops independently of the others and only gradually enters into relation with the others. Furthermore, it takes place only very slowly; the various stages and interests are never completely overcome, but only subordinated to the prevailing interest and trail along beside the latter for centuries afterwards. It follows from this that within a nation itself the individuals, even apart from their pecuniary circumstances, have quite different developments, and that an earlier interest, the peculiar form of intercourse of which has already been ousted by that belonging to a later interest, remains for a long time afterwards in possession of a traditional power in the illusory community (State, law), which has won an existence independent of the individuals; a power which in the last resort can only be broken by a revolution. This explains why, with reference to individual points which allow of a more general summing-up, consciousness can sometimes appear further advanced than the contemporary empirical relationships, so that in the struggles of a later epoch one can refer to earlier theoreticians as authorities.

On the other hand, in countries which, like North America, begin in an already advanced historical epoch, the development proceeds very rapidly. Such countries have no other natural premises than the individuals, who settled there and were led to do so because the forms of intercourse of the old countries did not correspond to their wants. Thus they begin with the most advanced individuals of the old countries, and, therefore, with the correspondingly most advanced form of intercourse, before this form of intercourse has been able to establish itself in the old countries. This is the case with all colonies, insofar as they are not mere military or trading stations. Carthage, the Greek colonies, and Iceland in the eleventh and twelfth centuries, provide examples of this. A similar relationship issues from conquest, when a form of intercourse which has evolved on another soil is brought over complete to the conquered country: whereas in its home it was still encumbered with interests and relationships left over from earlier periods, here it can and must be established completely and without hindrance, if only to assure the conquerors' lasting power. (England and Naples after the Norman conquest, when they received the most perfect form of feudal organisation.)

[5. The Contradiction Between the Productive Forces and the Form of Intercourse as the Basis for Social Revolution]

This contradiction between the productive forces and the form of intercourse, which, as we saw, has occurred several times in past history, without, however, endangering the basis, necessarily on each occasion burst out in a revolution, taking on at the same time various subsidiary forms, such as all-embracing collisions, collisions of various classes, contradiction of consciousness, battle of ideas, etc., political conflict, etc. From a narrow point of view one may isolate one of these subsidiary forms and consider it as the basis of these revolutions; and this is all the more easy as the individuals who started the revolutions had illusions about their own activity according to their degree of culture and the stage of historical development.

Thus all collisions in history have their origin, according to our view, in the contradiction between the productive forces and the form of intercourse. Incidentally, to lead to collisions in a country, this contradiction need not necessarily have reached its extreme limit in this particular country. The competition with industrially more advanced countries, brought about by the expansion of international intercourse, is sufficient to produce a similar contradiction in countries with a backward industry (e.g. the latent proletariat in Germany brought into view by view by the competition of English industry).

Conquest

This whole interpretation of history appears to be contradicted by the fact of conquest. Up till now violence, war, pillage, murder and robbery, etc. have been accepted as the driving force of history. Here we must limit ourselves to the chief points and take, therefore, only the most striking example — the destruction of an old civilisation by a barbarous people and the resulting formation of an entirely new organisation of society. (Rome and the barbarians; feudalism and Gaul; the Byzantine Empire and the Turks.)

With the conquering barbarian people war itself is still, as indicated above, a regular form of intercourse, which is the more eagerly exploited as the increase in population together with the traditional and, for it, the only possible, crude mode of production gives rise to the need for new means of production. In Italy, on the other hand, the concentration of landed property (caused not only by buying-up and indebtedness but also by inheritance, since loose living being rife and marriage rare, the old families gradually died out and their possessions fell into the hands of a few) and its conversion into grazing land (caused not only by the usual economic forces still operative today but by the importation of plundered and tribute-corn and the resultant lack of demand for Italian corn) brought about the almost total disappearance of the free population. The very slaves died out again and again, and had constantly to be replaced by new ones. Slavery remained the basis of the whole productive system. The plebeians, midway between freemen and slaves, never succeeded in becoming more than a proletarian rabble. Rome indeed never became more than a city; its connection with the provinces was almost exclusively political and could, therefore, easily be broken again by political events.

Nothing is more common than the notion that in history up till now it has only been a question of taking. The barbarians take the Roman Empire, and this fact of taking is made to explain the transition from the old world to the feudal system. In this taking by barbarians, however, the question is, whether the nation which is conquered has evolved industrial productive forces, as is the case with modern peoples, or whether their productive forces are based for the most part merely on their association and on the community. Taking is further determined by the object taken. A banker's fortune, consisting of paper, cannot be taken at all, without the taker's submitting to the conditions of production and intercourse of the country taken. Similarly the total industrial capital of a modern industrial country. And finally, everywhere there is very soon an end to taking, and when there is nothing more to take, you have to set about producing. From this necessity of producing, which very soon asserts itself, it follows that the form of community adopted by the settling conquerors must correspond to the stage of development of the productive forces they find in existence; or, if this is not the case from the start, it must change according to the productive forces. By this, too, is explained the fact, which people profess to have noticed everywhere in the period following the migration of the peoples, namely, that the servant was master, and that the conquerors very soon took over language, culture and manners from the conquered. The feudal system was by no means brought complete from Germany, but had its origin, as far as the conquerors were concerned, in the martial organisation of the army during the actual conquest, and this only evolved after the conquest into the feudal system proper through the action of the productive forces found in the conquered countries. To what an extent this form was determined by the productive forces is shown by the abortive attempts to realise other forms derived from reminiscences of ancient Rome (Charlemagne, etc.).

Contradictions of Big Industry: Revolution

Our investigation hitherto started from the instruments of production, and it has already shown that private property was a necessity for certain industrial stages. In *industrie extractive* private property still coincides with labour; in small industry and all agriculture up till now property is the necessary consequence of the existing instruments of production; in big industry the contradiction between the instrument of production and private property appears from the first time and is the product of big industry; moreover, big industry must be highly developed to produce this contradiction. And thus only with big industry does the abolition of private property become possible.

[9. Contradiction Between the Productive Forces and the Form of Intercourse]

In big industry and competition the whole mass of conditions of existence, limitations, biases of individuals, are fused together into the two simplest forms: private property and labour. With money every form of intercourse, and intercourse itself, is considered fortuitous for the individuals. Thus money implies that all previous intercourse was only intercourse of individuals under particular conditions, not of individuals as individuals. These conditions are reduced to two: accumulated labour or private property, and actual labour. If both or one of these ceases, then intercourse comes to a standstill. The modern economists themselves, e.g. Sismondi, Cherbuliez, etc., oppose "association of individuals" to "association of capital." On the other hand, the individuals themselves are entirely subordinated to the division of labour and hence are brought into the most complete dependence on one another. Private property, insofar as within labour itself it is opposed to labour, evolves out of the necessity of accumulation, and has still, to begin with, rather the form of the communality; but in its further development it approaches more and more the modern form of private property. The division of labour implies from the outset the division of the conditions of labour, of tools and materials, and thus the splitting-up of accumulated capital among different owners, and thus, also, the division between capital and labour, and the different forms of property itself. The more the division of labour develops and accumulation grows, the sharper are the forms that this process of differentiation assumes. Labour itself can only exist on the premise of this fragmentation.

Thus two facts are here revealed. First the productive forces appear as a world for themselves, quite independent of and divorced from the individuals, alongside the individuals: the reason for this is that the individuals, whose forces they are, exist split up and in opposition to one another, whilst, on the other hand, these forces are only real forces in the intercourse and association of these individuals. Thus, on the one hand, we have a totality of productive forces, which have, as it were, taken on a material form and are for the individuals no longer the forces of the individuals but of private property, and hence of the individuals only insofar as they are owners of private property themselves. Never, in any earlier period, have the productive forces taken on a form so indifferent to the intercourse of individuals as individuals, because their intercourse itself was formerly a restricted one. On the other hand, standing over against these productive forces, we have the majority of the individuals from whom these forces have been wrested away, and who, robbed thus of all real life-content, have become abstract individuals, but who are, however, only by this fact put into a position to enter into relation with one another *as individuals*.

The only connection which still links them with the productive forces and with their own existence — labour — has lost all semblance of self-activity and only sustains their life by stunting it. While in the earlier periods self-activity and the production of material life were separated, in that they devolved on different persons, and while, on account of the narrowness of the individuals themselves, the production of material life was considered as a subordinate mode of self-activity, they now diverge to such an extent that altogether material life appears as the end, and what produces this material life, labour (which is now the only possible but, as we see, negative form of self-activity), as the means.

[10. The Necessity, Preconditions and Consequences of the Abolition of Private Property]

Thus things have now come to such a pass that the individuals must appropriate the existing totality of productive forces, not only to achieve self-activity, but, also, merely to safeguard their very existence. This appropriation is first determined by the object to be appropriated, the productive forces, which have been developed to a totality and which only exist within a universal intercourse. From this aspect alone, therefore, this appropriation must have a universal character corresponding to the productive forces and the intercourse.

The appropriation of these forces is itself nothing more than the development of the individual capacities corresponding to the material instruments of production. The appropriation of a totality of instruments of production is, for this very reason, the development of a totality of capacities in the individuals themselves.

This appropriation is further determined by the persons appropriating. Only the proletarians of the present day, who are completely shut off from all self-activity, are in a position to achieve a complete and no longer restricted self-activity, which consists in the appropriation of a totality of productive forces and in the thus postulated development of a totality of capacities. All earlier revolutionary appropriations were restricted; individuals, whose self-activity was restricted by a crude instrument of production and a limited intercourse, appropriated this crude instrument of production, and hence merely achieved a new state of limitation. Their instrument of production became their property, but they themselves remained subordinate to the division of labour and their own instrument of production. In all expropriations up to now, a mass of individuals remained subservient to a single instrument of production; in the appropriation by the proletarians, a mass of instruments of production must be made subject to each individual, and property to all. Modern universal intercourse can be controlled by individuals, therefore, only when controlled by all.

This appropriation is further determined by the manner in which it must be effected. It can only be effected through a union, which by the character of the proletariat itself can again only be a universal one, and through a revolution, in which, on the one hand, the power of the earlier mode of production and intercourse and social organisation is overthrown, and, on the other hand, there develops the universal character and the energy of the proletariat, without which the revolution cannot be accomplished; and in which, further, the proletariat rids itself of everything that still clings to it from its previous position in society.

Only at this stage does self-activity coincide with material life, which corresponds to the development of individuals into complete individuals and the casting-off of all natural limitations. The transformation of labour into self-activity corresponds to the transformation of the earlier limited intercourse into the intercourse of individuals as such. With the appropriation of the total productive forces through united individuals, private property comes to an end. Whilst previously in history a particular condition always appeared as accidental, now the isolation of individuals and the particular private gain of each man have themselves become accidental.

The individuals, who are no longer subject to the division of labour, have been conceived by the philosophers as an ideal, under the name "Man". They have conceived the whole process which we have outlined as the evolutionary process of "Man," so that at every historical stage "Man" was substituted for the individuals and shown as the motive force of history. The whole process was thus conceived as a process of the self-estrangement of "Man," and this was essentially due to the fact that the average individual of the later stage was always foisted on to the earlier stage, and the consciousness of a later age on to the individuals of an earlier. Through this inversion, which from the first is an abstract image of the actual conditions, it was possible to transform the whole of history into an evolutionary process of consciousness.

The Necessity of the Communist Revolution

Finally, from the conception of history we have sketched we obtain these further conclusions:

(1) In the development of productive forces there comes a stage when productive forces and means of intercourse are brought into being, which, under the existing relationships, only cause mischief, and are no longer productive but destructive forces (machinery and money); and connected with this a class is called forth, which has to bear all the burdens of society without enjoying its advantages, which, ousted from society, is forced into the most decided antagonism to all other classes; a class which forms the majority of all members of society, and from which emanates the consciousness of the necessity of a fundamental revolution, the communist consciousness, which may, of course, arise among the other classes too through the contemplation of the situation of this class.

(2) The conditions under which definite productive forces can be applied are the conditions of the rule of a definite class of society, whose social power, deriving from its property, has its practical-idealistic expression in each case in the form of the State; and, therefore, every revolutionary struggle is directed against a class, which till then has been in power. [4]

(3) In all revolutions up till now the mode of activity always remained unscathed and it was only a question of a different distribution of this activity, a new distribution of labour to other persons, whilst the communist revolution is directed against the preceding mode of activity, does away with labour, and abolishes the rule of all classes with the classes themselves, because it is carried through by the class which no longer counts as a class in society, is not recognised as a class, and is in itself the expression of the dissolution of all classes, nationalities, etc. within present society; and

(4) Both for the production on a mass scale of this communist consciousness, and for the success of the cause itself, the alteration of men on a mass scale is, necessary, an alteration which can only take place in a practical movement, a revolution; this revolution is necessary, therefore, not only because the ruling class cannot be overthrown in any other way, but also because the class overthrowing it can only in a revolution succeed in ridding itself of all the muck of ages and become fitted to found society anew.

Footnotes

1. [*Marginal note by Marx:*] To begin with it absorbs the branches of labour directly belonging to the State and then all ±[more or less] ideological estates.

2. The Statement which frequently occurs with Saint Max that each is all that he is through the State is fundamentally the same as the statement that bourgeois is only a specimen of the bourgeois species; a statement which presupposes that the class of bourgeois existed before the individuals constituting it. [*Marginal note by Marx to this sentence:*] With the philosophers pre-existence of the class.

3. N.B. — It must not be forgotten that the serf's very need of existing and the impossibility of a large-scale economy, which involved the distribution of the allotments among the serfs, very soon reduced the services of the serfs to their lord to an average of payments in kind and statute-labour. This made it possible for the serf to accumulate movable property and hence facilitated his escape out of the possession of his lord and gave him the prospect of making his way as an urban citizen; it also created gradations among the serfs, so that the runaway serfs were already half burghers. It is likewise obvious that the serfs who were masters of a craft had the best chance of acquiring movable property.

4. [*Marginal note by Marx:*] The people are interested in maintaining the present state of production.

The Leipzig Council

The Leipzig Council — this is an allusion to the fact that the works of Bruno Bauer and Max Stirner, the two "church fathers" criticised in this section, were published in Leipzig.

In the third volume of the *Wigand'sche Vierteljahrsschrift* for 1845 the battle of the Huns, prophetically portrayed by Kaulbach,[1] actually takes place. The spirits of the slain, whose fury is not appeased even in death, raise a hue and cry, which sounds like the thunder of battles and war-cries, the clatter of swords, shields and iron waggons. But it is not a battle over earthly things. The holy war is being waged not over protective tariffs, the constitution, potato blight[2], banking affairs and railways, but in the name of the most sacred interests of the spirit, in the name of "substance", "self-consciousness", "criticism;', the "unique" and the "true man". We are attending a council of church fathers. As these church fathers are the last specimens of their kind, and as here, it is to be hoped, the cause of the Most High, alias the Absolute, is being pleaded for the last time, it is worth while taking a verbatim report of the proceedings.

Here, first of all, is *Saint Bruno*, who is easily recognised by his *stick* ("become sensuousness, become a *stick*", *Wigand,* p. 130).' His head is crowned with a halo of "pure criticism" and, full of contempt for the world, he wraps himself in his "self-consciousness". He has ',*smashed* religion in its entirety and the state in its manifestations" (p. 138), by violating the concept of "substance" in the name of the most high self-consciousness. The ruins of the church and "debris" of the state lie at his feet, while his glance "strikes clown" the "masses into the dust. He is like God, he has neither father nor mother, he is "his own creation, his own product" (p. 136). In short, he is the "Napoleon" of the spirit, in spirit he is "Napoleon". His spiritual exercises consist in constantly "examining himself, and in this self-examination he finds the impulse to self-determination" (p. 136); as a result of such wearisome self-recording he has obviously become emaciated. Besides "examining" himself — from time to time he "examines" also, as we shall see, the *Westphälische Dampfboot.*

Opposite him stands *Saint Max*, whose services to the Kingdom of God consist in asserting that he has established and proved — on approximately 600 printed pages [Der Einzige und sein Eigenthum] — his identity, that he is not just anyone, not some "Tom, Dick or Harry", but precisely Saint Max and no other. About his halo and other marks of distinction only one thing can be said: that they are "his object and thereby his property", that they are "unique" and "incomparable" and that they are "inexpressible" (p. 148).c He is simultaneously the "phrase" and the "owner of the phrase", simultaneously Sancho Panza and Don Quixote. His ascetic exercises consist of sour thoughts about thoughtlessness, of considerations throughout many pages about inconsiderateness and of the sanctification of unholiness. Incidentally, there is no need for us to elaborate on his virtues, for concerning all the qualities ascribed to him — even if there were more of them than the. names of God among the Muslims — he is in the habit of saying: I am all this and something more, 1 am the all of this nothing and the nothing of this all. He is favourably distinguished from his gloomy rival in possessing a certain solemn "*light-heartedness*" and from time to time he interrupts his serious ponderings with a "*critical hurrah*".

These two grand masters of the Holy Inquisition summon the heretic Feuerbach, who has to defend himself against the grave charge of gnosticism. The heretic Feuerbach, "thunders" Saint Bruno, is in possession of *hyle,* substance, and refuses to hand it over lest my infinite self-consciousness be reflected in it. Self-consciousness has to wander like a ghost until it has taken back into itself all things which arise from it and flow into it. It has already swallowed the whole world, except for this *hyle*, substance, which the gnostic Feuerbach keeps under lock and key and refuses to hand over.

Saint Max accuses the gnostic of doubting the dogma revealed by the mouth of Saint Max himself, the dogma that "every goose, every dog, every horse" is "the perfect, or, if one prefers the superlative degree, the most perfect, man". (*Wigand*, p. 187: "The aforesaid does not lack a tittle of what makes man a man. Indeed, the *same* applies also to every goose, every dog, every, horse.")

Besides the hearing of these important indictments, sentence is also pronounced in the case brought by the two saints against Moses Hess and in the case brought by Saint Bruno against the authors of *Die Heilige Familie*. But as these accused have been busying themselves with "worldly affairs" and, therefore, have failed to appear before the Santa Casa, [3] they are sentenced in their absence to eternal banishment from the realm of the spirit for the term of their natural life.

Finally, the two grand masters are again starting some strange intrigues among themselves and against each other.

Footnotes

1. The Battle of the Huns (Hunnenschlacht), one of the best-known pictures by Wilhelm von Kaulbach, painted in 1834-37, is based on the battle fought by the Huns and the Romans at Châlons in 451. Kaulbach depicts the ghosts of fallen warriors fighting in the air above the battleground

2. A reference to the potato blight of 1845 which affected Ireland, many regions of England and some parts of the Continent. It led to a failure of the potato crop and devastating famine in Ireland.

3. Santa Casa (The Sacred House) — the name of the headquarters of the Inquisition in Madrid

Part II: Saint Bruno

1. “Campaign” Against Feuerbach

Before turning to the solemn discussion which Bauer’s selfconsciousness has with itself and the world, we should reveal one secret. Saint Bruno uttered the battle-cry and kindled the war only because he had to “safeguard” himself and his stale, soured criticism against the ungrateful forgetfulness of the public, only because he had to show that, in the changed conditions of 1845, criticism always remained itself and unchanged. He wrote the second volume of the “good cause and his own cause” [Bruno Bauer’s article “Charakteristik Ludwig Feuerbachs” is here ironically called the second volume of Bauer’s book Die gute.Sache der Freiheit und meine eigene Angelegenheit — The Good Cause of Freedom and My Own Cause]: he stands his ground, he fights *pro aris et focis*. [literally: for altars and hearths, used in the sense of: for house and home — that is, pleading his own cause] In the true theological manner, however, he conceals this aim of his by an appearance of wishing to “characterise” Feuerbach. Poor Bruno was quite forgotten, as was best proved by the polemic between Feuerbach and Stirner, [Feuerbach, “Ueber das ‘Wesen des Chrienthums’ in Bezichung auf den ‘Einzigen und sein Eigenthum'"] which no notice at all was taken of him. For just this reason he seized on this polemic in order to be able to proclaim himself, as the antithesis of the antagonists, their higher unity, the Holy Spirit.

Saint Bruno opens his “campaign” with a burst of artillery fire against Feuerbach, that is to say, with a revised and enlarged reprint of an article which had already appeared in the *Norddeutsche Blätter*. [Bruno Bauer’s article “Ludwig Feuerbach"] Feuerbach is made into a knight of “*substance*” in order that Bauer’s *self-consciousness*” shall stand out in stronger relief. In this trans-substantiation of Feuerbach, which is supposed to be proved by all the writings of the latter, our holy man jumps at once from Feuerbach’s writings on Leibniz and Bayle [The reference is to the following works of Feuerbach: Geschichte der neuern Philosophie. Darstellung, Entwirklung und Kritik der Leibnitzischen Philosophie and Pierre Bayle] to the *Wesen des Christenthmus*, leaving out the article against the “positive philosophers”,[1] in the *Hallische Jahrbücher*. [Ludwig Feuerbach, “Zur Kritik der ‘positiven Philosophie'"] This “oversight” is “in place”. For there Feuerbach revealed the whole wisdom of “selfconsciousness” as against the positive representatives of “substance”, at a time when Saint Bruno was still indulging in speculation on the immaculate conception.

It is hardly necessary to mention that Saint Bruno still continues to prance about on his old-Hegelian war horse. Listen to the first passage in his latest revelations from the Kingdom of God:

"Hegel combined into one Spinoza's substance and Fichte's ego; the unity of both, the combination of these opposing spheres, etc., constitutes the peculiar interest but, at the same time, the weakness of Hegel's philosophy. [...] This contradiction in which Hegel's system was entangled had to be resolved and destroyed. But he could only do this by making it impossible for all time to put the question: what is the relation of self-consciousness to the absolute spirit.... This was possible in two ways. Either self-consciousness had to be burned again in the flames of substance, i.e., the pure substantiality relation had to be firmly established and maintained, or it had to be shown that personality is the creator of its own attributes and essence, that it belongs to the concept of personality in general to posit itself" (the "concept" or the personality"?) "as limited, and again to abolish this limitation which it posits by its universal essence, for precisely this essence is only the result of its inner self-distinction of its activity" (Wigand, pp. 86, 87, 88). [Bruno Bauer, "Charakteristik Ludwig Feuerbachs"]

In *Die Heilige Familie* (p. 220) Hegelian philosophy was represented as a union of Spinoza and Fichte and at the same time the contradiction involved in this was emphasised. The specific peculiarity of Saint Bruno is that, unlike the authors of *Die Heilige Familie,* he does not regard the question of the relation of selfconsciousness to substance as "a point of controversy within Hegelian speculation", but as a world-historic, even an absolute question. This is the sole form in which he is capable of expressing the conflicts of the present day. He really believes that the triumph of selfconsciousness over substance has a most essential influence not only on European equilibrium but also on the whole future development of the Oregon problem[2]. As to the extent to which the abolition of the Corn Laws in England depends on it, very little has so far transpired.[3]

The abstract and nebulous expression into which a real collision is distorted by Hegel is held by this "critical" mind to be the real collision itself. Bruno accepts the *speculative* contradiction and upholds one part of it against the other. A philosophical *phrase* about a real question is for him the real question itself. Consequently, on the one hand, instead of real people and their real consciousness of their social relations, which apparently confront them as something independent, he has the mere abstract expression: *self-consciousness,* just as, instead of real production, he has the *activity of this self-consciousness, which has become independent.* On the other hand, instead of real nature and the actually existing social relations, he has the philosophical summing-up of all the philosophical categories or names of these relations in the expression: *substance*; for Bruno, along with all philosophers and ideologists, erroneously regards thoughts and ideas — the independent intellectual expression of the existing world — as the basis of this existing world. It is obvious that with these two abstractions, which have become senseless and empty, he can perform all kinds of tricks without knowing anything at all about real people and their relations. (See, in addition, what is said about substance in connection with Feuerbach and concerning "humane liberalism" and the "holy" in connection with Saint Max.) Hence, he does not forsake the speculative basis in order to solve the contradictions of speculation; he manoeuvres while remaining on that basis, and he himself still stands so much on the specifically Hegelian basis that the relation of "self-consciousness" to the "absolute spirit" still gives him no peace. In short, we are confronted with the *philosophy of self-consciousness* that was announced in the *der Synoptiker,* carried out in *Das entdenckte Christenthum* and which, unfortunately, was long ago anticipated in Hegel's *Phänomenologie.* This new philosophy of Bauer's was completely disposed of in *Die Heilige Familie* on page 220 et seq. and on pages 304-07. Here, however, Saint Bruno even contrives to caricature himself by smuggling in "personality", in order to be able, with *Stirner*, to portray the single individual as "his own product", and *Stirner* as *Bruno's product.* This step forward deserves a brief notice.

First of all, let the reader compare this caricature with the original, the explanation given of self-consciousness in *Das entdeckte Christenthum*, page 113, and then let him compare this explanation with its prototype, with Hegel's *Phänomenologie*, pages 575, 583 and so on. (Both these passages are reproduced in *Die Heilige Familie*, pages 221, 223, 224.) But now let us turn to the caricature! "Personality in general"! "Concept"! "Universal essence"! "To posit itself as limited and again to abolish the limitation"! "Inner self-distinction"! What tremendous "results"! "Personality 'it general" is either nonsense "in general" or the abstract concept of personality. Therefore, it is part of the "concept" of the concept of personality to "posit itself as limited". This limitation, which belongs to the "concept" of its concept, personality directly afterwards posits "by its universal essence". And after it has again abolished this limitation, it turns out that "precisely this essence" is "the *result* of its inner self-distinction". The entire grandiose result of this intricate tautology amounts, therefore, to Hegel's familiar trick of the self-distinction of man in thought, a self-distinction which the unfortunate Bruno stubbornly proclaims to be the sole activity of "personality in general". A fairly long time ago it was pointed out to Saint Bruno that there is nothing to be got from a "personality" whose activity is restricted to these, by now trivial, logical leaps. At the same time the passage quoted contains the naive admission that the essence of Bauer's "personality" is the concept of a concept, the abstraction of an abstraction.

Bruno's criticism of Feuerbach, insofar as It is new, is restricted to hypocritically representing Stirner's reproaches against Feuerbach *and Bauer* as Bauer's reproaches against Feuerbach. Thus, for example, the assertions that the "essence of man is essence in general and something holy", that "man is the God of man", that the human species is "the Absolute", that Feuerbach splits man "into an essential and an inessential ego" (although Bruno always declares that the abstract is the essential and, in his antithesis of criticism and the mass, conceives this split as far more monstrous than Feuerbach does), that a struggle must be waged against the "predicates of God", etc. On the question of selfish and selfless love, Bruno, polemising with Feuerbach, copies Stirner almost word for word for three pages (pp. 133-35) just as he very clumsily copies Stirner's phrases: "every man is his own creation", "truth is a ghost", and so on. In addition, in Bruno the "creation" is transformed into a "product". We shall return to this exploitation of Stirner by Saint Bruno.

Thus, the first thing that we discovered in Saint Bruno was his continual dependence on Hegel. We shall not, of course, dwell further on the remarks he has copied from Hegel, but shall only put together a few more passages which show how firmly he believes in the power of the philosophers and how he shares their illusion that a modified consciousness, a new turn given to the interpretation of existing relations, could overturn the whole hitherto existing world. imbued with this faith, Saint Bruno also has one of his pupils certify — in issue IV of Wigand's quarterly, p. 327 — that his phrases on personality given above, which were proclaimed by him in issue III, were "world-shattering ideas". ["Ueber das Recht des Freigesprochenen..."]

Saint Bruno says (*Wigand*, p. 95) [Bruno Bauer, "Charakteristik Ludwig Feuerbachs"]

"Philosophy has never been anything but theology reduced to its most general form and given its most rational expression."

This passage, aimed against Feuerbach, is copied almost word for word from Feuerbach's *Philosophie der Zukunft* (p. 2):

"Speculative philosophy is true, consistent, rational theology."

Bruno continues:

"Philosophy, in alliance with religion, has always striven for the absolute dependence of the individual and has actually achieved this by demanding and causing the absorption of the individual life in universal life, of the accident in substance, of man in the absolute spirit."

As if Bruno's "philosophy", "in alliance with" Hegel's, and his still continuing forbidden association with theology, did not "demand", if not "cause", the "absorption of man" in the idea of one of his "accidents", that of self-consciousness, as "substance"! Moreover, one sees from this whole passage with what joy the church father with his "pulpit eloquence" continues to proclaim his "world-shattering" faith in the mysterious power of the holy theologians and philosophers. Of course, in the interests of the "good cause of freedom and his own cause". [ironical allusion to Bauer's book Die gute Sache der Freiheit und meine eigene Angelegenheit] On page 105 our god-fearing man has the insolence to reproach Feuerbach:

“Feuerbach made of the individual, of the depersonalised man of Christianity, not a man, not a true” (!) “real” (!!) “personal” (!!!) “man” (these predicates owe their origin to Die Heilige Familie and Stirner), “but an emasculated man, a slave” —

and thereby utters, *inter alia*, the nonsense that he, Saint Bruno, can *make* people by means of the *mind*. Further on in the same passage he says:

“According to Feuerbach the individual has to subordinate himself to the species, serve it. The species of which Feuerbach speaks is Hegel’s Absolute, and it, too, exists nowhere.”

Here, as in all the other passages, Saint Bruno does not deprive himself of the glory of making the actual relations of individuals dependent on the philosophical interpretation of these relations. He has not the slightest inkling of the correlation which exists between the concepts of Hegel’s “absolute spirit” and Feuerbach’s “species” on the one hand and the existing world on the other. On page 104 the holy father is mightily shocked by the heresy with which Feuerbach transforms the holy trinity of reason, love and will into something that “is *in* individuals and *over* individuals”, as though, in our day, every inclination, every impulse, every need did not assert itself as a force “in the individual and *over* the individual”, whenever circumstances hinder their satisfaction. If the holy father Bruno experiences hunger, for example, without the means of appeasing it, then even his stomach will become a force “*in* him and *over* him”. Feuerbach’s mistake is not that he stated this fact but that in idealistic fashion he endowed it with independence instead of regarding it as the product of a definite and surmountable stage of historical development.

Page 111: “Feuerbach is a slave and his servile nature does not allow him to fulfil the work of a man, to recognise the essence of religion” (what a fine “work of a man"!)....... He does not perceive the essence of religion because he does not know the bridge over which he can make his way to the source of religion.”

Saint Bruno still seriously believes that religion has its own “essence”. As for the “bridge”, “*over which*” one makes one’s way to the “*source* of religion”, this asses’ bridge [a pun in the original: Eselsbrücke — asses’ bridge — an expedient used by dull or lazy people to understand a difficult problem] must certainly be an *aqueduct*. At the same time Saint Bruno establishes himself as a curiously modernised Charon who has been retired owing to the building of the bridge, becoming a *toll-keeper* who demands a *halfpenny* from every person crossing the bridge to the spectral realm of religion. On page 120 the saint remarks:

“How could Feuerbach exist if there were no truth and truth were only a spectre” (Stirner, help!') “of which hitherto man has been afraid?”

The “man” who fears the “spectre” of “truth” is no other than the worthy Bruno himself. Ten pages earlier, on p. 110, he had already let out the following world-shattering cry of terror at the sight of the “spectre” of truth:

“Truth which is never of itself encountered as a ready-made object and which develops itself and reaches unity only in the unfolding of personality.”

Thus, we have here not only truth, this spectre, transformed into a person which develops itself and reaches unity, but in addition this trick is accomplished in a third personality outside it, after the manner of the tapeworm. Concerning the holy man’s former love affair with truth, when he was still young and the lusts of the flesh still strong in him — see *Die Heilige Familie*, p. 115 et seq.' How purified of all fleshly lusts and earthly desires our holy man now appears is shown by his vehement polemic against Feuerbach’s *sensuousness*. Bruno by no means attacks the highly restricted way in which Feuerbach recognises *sensuousness*. He regards Feuerbach’s unsuccessful attempt, since it is an attempt to escape ideology, as — a sin. Of course! Sensuousness is lust of the eye, lust of the flesh and arrogance [cf. 1 John 2:16] — horror and abomination [cf. Ezekiel 11:18] in the eyes of the Lord! Do you not know that to be fleshly minded is death, but to be spiritually minded is life and peace; for to be fleshly, minded is hostility to criticism, and everything of the flesh is of this world. And do you not know that it is written: the works of the flesh are manifest, they are adultery, fornication, uncleanness, obscenity, idolatry, witchcraft, enmity, strife, envy, anger, quarrelsomeness, discord, sinful gangs, hatred, murder, drunkenness, gluttony and the like. [cf. Galatians 5:19-21] I prophesy to you, as I prophesied before, that those who do such works will not inherit the kingdom of criticism; but woe to them for in their thirst for delights they are following the path of Cain and are falling into the error of Balaam, and will perish in a rebellion, like that of Korah. These lewd ones feast shamelessly on your alms, and fatten themselves. They are clouds without water driven by the wind; bare, barren trees, twice dead and uprooted; wild ocean waves frothing their own shame; errant stars condemned to the gloom of darkness for ever. [cf. Jude 11-13] For we have read that in the last days there will be terrible times, people will appear who think much of themselves, lewd vilifiers who love voluptuousness [cf. 2 Timothy 3:1-4] more than criticism, makers of sinful gangs, in short, slaves of the flesh. Such people are shunned by Saint Bruno, who is spiritually minded and loathes the stained covering of the flesh [cf. Jude 23] and for this reason he condemns Feuerbach, whom he regards as the Korah of the gang, to remain outside together with the dogs, the magicians, the debauched and the assassins. [cf. Revelation 22:15] “Sensuousness” — ugh! Not only does it throw the saintly church father into the most violent convulsions, but it even makes him sing, and on page 121 he chants the "song of the end and the end of the song". Sensuousness — do you know, unfortunate one, what sensuousness is? Sensuousness is — a "stick" (p. 130). Seized with convulsions, Saint Bruno even wrestles on one occasion with one of his own theses, just as Jacob of blessed memory wrestled with God, with the one difference that God twisted Jacob's thigh, while our saintly epileptic twists all the limbs and ties of his own thesis, and so, by a number of striking examples, makes clear the identity of subject and object:

"Feuerbach may say what he likes ... all the same he destroys" (!) "man... for he transforms the word man into a mere phrase ... for he does not wholly make" and create" (!) "man, but raises the whole of mankind to the Absolute, for in addition he declares not mankind, but rather the senses to be the organ of the Absolute, and stamps the sensuous — the object of the senses, of perception, of sensation — as the Absolute, the indubitable and the immediately certain. Whereby Feuerbach — such is Saint Bruno's opinion — "can undoubtedly shake layers of the air, but he cannot smash the phenomena of human essence, because his innermost" (!) "essence and his vitalising spirit [...] already destroys the external" (!) "sound and makes it empty and jarring" (p. 121).

Saint Bruno himself gives us mysterious but decisive disclosures about the causes of his nonsensical attitude:

"As though my ego does not also possess just this particular sex, unique, compared with all others, and these particular, unique sex organs," (Besides his "unique sex organs", this noble-minded man also possesses a special "unique sex"!)

This unique sex is explained on page 121 in the sense that:

"sensuousness, like a vampire, sucks all the marrow and blood from the life of man; it is the insurmountable barrier against which man has to deal himself a mortal blow".

But even the saintliest man is not pure! They are all sinners and lack the glory that they should have before "self-consciousness". Saint Bruno, who in his lonely cell at midnight struggles with "substance", has his attention drawn by the frivolous writings of the heretic Feuerbach to women and female beauty. Suddenly his sight becomes less keen; his pure self-consciousness is besmirched, and a reprehensible, sensuous fantasy plays about the frightened critic with lascivious images. The spirit is willing but the flesh is weak. [cf. Matthew 26:41] Bruno stumbles, he falls, he forgets that he is the power that "with its strength binds, frees and dominates the world", [cf. ibid. 16:19] he forgets that these products of his imagination are "spirit of his spirit", he loses all "self-control" and, intoxicated, stammers a dithyramb to female beauty, to its “tenderness, softness, womanliness”, to the “full and rounded limbs” and the “*surging, undulating, seething, rushing and hissing*, wave-like *structure* of the body” of woman. Innocence, however, always reveals itself — even where it sins. Who does not know that a “surging, undulating, wave-like structure of the body” is Something that no eye has ever seen, or ear heard? Therefore — hush, sweet soul, the spirit will soon prevail over the rebellious flesh and set an insurmountable “barrier” to the overflowing, seething lusts, “against which” they will soon deal themselves a “mortal blow”.

“Feuerbach” — the saint finally arrives at this through a critical understanding of Die Heilige Familie — “is a materialist tempered with and corrupted by humanism, i.e., a materialist who is unable to endure the earth and its being” (Saint Bruno knows the being of the earth as distinct from the earth itself, and knows how one should behave in order to “endure the being of the earth"!) “but wants to spiritualism himself and rise into heaven; and at the same time he is a humanist who cannot think and build a spiritual world, but one who is impregnated with materialism”, and so on (p. 123).

Just as for Saint Bruno humanism, according to this, consists in thinking” and in “building a spiritual world”, so materialism consists in the following:

“The materialist recognises only the existing, actual being, matter” (as though man with all his attributes, including thought, were not an “existing, actual being”), “and recognises it as actively extending and realising itself in multiplicity, nature” (p. 123).

First, *matter* is an existing, actual being, but only in itself, concealed; only when it “actively extends and realises itself in multiplicity” (an “existing, *actual* being” “realises itself"!!), only then does it become *nature*. First there exists the *concept* of matter, an abstraction, an idea, and this latter realises itself in actual nature. Word for word the Hegelian theory of the pre-existence of the creative categories. From this point of view it is understandable that Saint Bruno mistakes the philosophical phrases of the materialists concerning matter for the actual kernel and content of their world outlook.

2. Saint Bruno's Views on the Struggle Between Feuerbach and Stirner

Having thus admonished Feuerbach with a few weighty words, Saint Bruno takes a look at the struggle between Feuerbach and the unique. The first evidence of his interest in this struggle is a methodical, triple smile.

"The critic pursues his path irresistibly, confident of victory, and victorious. He is slandered — he smiles. He is called a heretic — he smiles. The old world starts a crusade against him — he smiles."

Saint Bruno — this is thus established — pursues his path but he does not pursue it like other people, he follows a critical course, he accomplishes this important action with a *smile*.

"He does smile his face into more lines than are in the new map, with the augmentation of the Indies. 1 know my lady will strike him: if she do, he'll smile and take it for a great art, [Shakespeare, Twelfth Night, Act III, Scene 2. Marx and Engels quote these lines front the German translation by August Wilhelm von Schlegel. But they have substituted the word Kunst (art) for the word Gunst (favour)] — like Shakespeare's Malvolio.

Saint Bruno himself does not lift a finger to refute his two opponents, he knows a better way of ridding himself of them, he leaves them — *divide et impera* — to their own quarrel. He confronts Stirner with Feuerbach's man (p. 124), and Feuerbach with Stirner's unique (p. 126 et seq.); he knows that they are as incensed against each other as the two Kilkenny cats in Ireland, which so completely devoured each other that finally only their tails remained. [4] And Saint Bruno passes sentence on these tails, declaring that they are "*substance*" and, consequently, condemned to eternal damnation.

In confronting Feuerbach with Stirner he repeats what Hegel said of Spinoza and Fichte, where, as we know, the punctiform ego is represented as one, and moreover the most stable, aspect of substance. However much Bruno formerly raged against egoism, which he even considered the *odor specificus* of the masses, on page 129 he accepts egoism from Stirner — only this should be "not that of Max Stirner", but, of course, that of Bruno Bauer. He brands Stirner's egoism as having the moral defect "that his ego for the support of its egoism requires hypocrisy, deception, external violence". For the rest, be believes (see p. 124) in the critical miracles of Saint Max and sees in the latter's struggle (p. 126) "a real effort to radically destroy substance". Instead of dealing with Stirner's criticism of Bauer's "pure criticism", he asserts on p. 124 that Stirner's criticism could affect him just as little as any other, "because *he himself is the critic*".

Finally Saint Bruno refutes both of thein, Saint Max and Feuerbach, applying almost literally to Feuerbach and Stirner the antithesis drawn by Stirner between the critic Bruno Bauer and the dogmatist.

Wigand, p. 138: "Feuerbach puts himself in opposition to, and thereby" (!) "stands in opposition to, the unique. He is a communist and wants to be one. The unique is an egoist and has to he one; he is the holy one, the other the profane one, he is the good one, the other the evil one, he is God, the other is man. Both are dogmatists."

The point is, therefore, that he accuses both of *dogmatism.*

Der Einzige und sein Eigenthum, p. 194: "The critic is afraid of becoming dogmatic or of putting forward dogmas. Obviously, he would then become the opposite of a critic, a dogmatist; he who as a critic was good, would now become evil, or from being unselfish" (a Communist) "would become an egoist, etc. Not a single dogma! — that is his dogma."

3. Saint Bruno Versus the Authors of *Die Heilige Familie*

Saint Bruno, who has disposed of Feuerbach and Stirner in the manner indicated and who has "cut the unique off from all progress", now turns against the apparent "consequences of Feuerbach", the German Communists and, especially, the authors of *Die Heilige Familie*. The expression "real humanism", which he found in the preface to this polemic treatise, provides the main basis of his hypothesis. He will recall a passage from the Bible:

"And I, brethren, could not speak unto you as unto spiritual, but as unto carnal" (in our case it was just the opposite), "even as unto babes in Christ. I have fed you with milk, and not with meat: for hitherto ye were not able to bear it" (1 Corinthians, 3: 1-2).

The first impression that *Die Heilige Familie* made on the worthy church father was one of profound distress and serious, respectable sorrow. The one good side of the book is that it

"showed what Feuerbach had to become, and the position his philosophy can adopt, if it desires to fight against criticism" (p. 138),

that, consequently, it combined in an easy-going way "desiring" with "what can be" and "what must he", but this good side does not out-weigh its many distressing sides. Feuerbach's philosophy, which strangely enough is presupposed here,

"dare not and cannot understand the critic, dare not and cannot know and perceive criticism in its development, dare not and cannot know that, in relation to all that is transcendental, criticism is a constant struggle and victory, a continual destruction and creation, the sole" (!) "creative and productive principle. It dare not and cannot know how the critic has worked, and still works, to posit and to make" (!) "the transcendental forces, which up to now have suppressed mankind and not allowed it to breathe and live, into what they really are, the spirit of the spirit, the innermost of the innermost, a native thing" (!) "out of and in the native soil, products and creations of self-consciousness. It dare not and cannot know that the critic and only the critic has smashed religion in its entirety, and the state in its various manifestations, etc." (pp. 138,139).

Is this not an exact copy of the ancient Jehovah, who runs after his errant people who found greater delight in the cheerful pagan gods, and cries out:

"Hear me, Israel, and close not your ear, Judah! Am I not the Lord your God, who led you out of the land of Egypt into the land flowing with milk and honey,

and behold, from your earliest youth you have done evil in my sight and angered me with the work of my hands and turned your back unto me and not your face towards me, though 1 invariably tutored you; and you have brought abominations into my house to defile it, and built the high places of Baal in the valley of the son of Himmon, which 1 did not command, and it never entered my head that you should do such abominations; and 1 have sent to you my servant Jeremiah, to whom I did address my word, beginning with the thirteenth year of the reign of King Josiah, son of Amon, unto this day — and for twenty-three years now he has been zealously preaching to you, but ye have not harkened. Therefore says the Lord God: Who has ever heard the like of the virgin of Israel doing such an abomination. For rain water does not disappear so quickly as my people forgets me. 0 earth, earth, earth, hear the word of the Lord!" [cf. Jeremiah 2:6, 32:22, 30, 33-35, 25:3, 19:3, 18:13, 14, 22:29]

Thus, in a lengthy speech on "to dare" and "to be able", Saint Bruno asserts that his communist opponents have misunderstood him. The way in which he describes criticism in this recent speech, the way in which he transforms the former forces that suppressed ',the life of mankind" into "transcendental forces", and these transcendental forces into the "spirit of the spirit", and the way in which he presents "criticism" as the sole branch of production proves that the apparent misconception is nothing but a disagreeable conception. We proved that Bauer's criticism is beneath all criticism, owing to which we have inevitably become dogmatists. He even in all seriousness reproaches us for our insolent disbelief in his ancient phrases. The whole mythology of independent concepts, with Zeus the Thunderer — self-consciousness — at the head, is paraded here once again to the "jingling of hackneyed phrases of a whole janissary band of current categories". (*Literatur-Zeitung*, cf. *Die Heilige Familie,* p. 234). First of all, of course, the myth of the creation of the world, i.e., of the hard "*1abour*" of the critic, which is "the sole creative and productive principle, a constant struggle and victory, a continual destruction and creation", "working" and "having worked". Indeed, the reverend father even reproaches *Die Heilige Familie* for understanding "criticism" in the same way as he understands it himself in the present rejoinder. After taking back "substance" "into the land of its birth, self-consciousness, the criticising and" (since *Die Heilige Familie* also) "the criticised man, and *discarding* it" (self-consciousness here seems to take the place of an ideological lumber-room), he continues:

"It" (the alleged philosophy of Feuerbach) "dare not know that criticism and the critics, as long as they have existed" (!) "have guided and made history, that even their opponents and all the movements and agitations of the present time are their creation, that it is they alone who hold power in their hands, because strength is in their consciousness, and because they derive power from themselves, from their deeds, from criticism, from' their opponents, from their

creations; that only by the act of criticism is man freed. and thereby men also, and man is created" (!) "and thereby mankind as well".

Thus, criticism *and* the critics are first of all two wholly different subjects, existing and operating apart from each other. The critic is a subject different from criticism, and criticism is a subject different from the critic. This personified criticism, criticism as a subject, is precisely that " critical criticism" against which *Die Heilige Familie* was directed. "Criticism and the critics, as long as they have existed, have guided and made history." It is clear that they could not do so "as long as they" did not "exist", and it is equally clear that "as long as they have existed" they "made history" in their own fashion. Finally, Saint Bruno goes so far as to "dare and be able" to give us one of the most profound explanations about the state-shattering power of criticism, namely, that "criticism and the critics hold *power in their hands*, because" (a fine "because"!) "*strength is in their consciousness*", and, secondly, that these great manufacturers of history "hold power in their hands", because they "derive power from themselves and from criticism" (i.e., again from themselves) — whereby it is still, unfortunately, not proven that it is possible to "derive" anything at all from there, from "themselves", from "criticism". On the basis of criticism's own words, one should at least believe that it must be difficult to "derive" from there anything more than the category of "substance" "discarded" there. Finally, criticism also "derives" "from criticism" "power" for a highly monstrous oracular dictum. For it reveals to us a secret that was hidden [cf. Colossians 1 :26] from our fathers and unknown to our grandfathers, the secret that "only by the act of criticism is man created, and thereby mankind as well" — whereas, up to now, criticism was erroneously regarded as an act of people who existed prior to it owing to quite different acts. Hence it seems that Saint Bruno himself came "into the world, from the world, and to the world" through "criticism", i.e., by *generatio aequiioca* [spontaneous generation]. All this is, perhaps, merely another interpretation of the following passage from the Book of Genesis: And Adam *knew*, i.e., criticised, Eve his wife: and she conceived, [cf. Genesis 4: 1] etc.

Thus we see here the whole familiar critical criticism, which was already sufficiently characterised in *Die Heilige Familie*, confronting us again with all its trickery as though nothing had happened. There is no need to be surprised at this, for the saint himself complains, on page 140, that *Die Heilige Familie* "cuts criticism off from all progress". With the greatest indignation Saint Bruno reproaches the authors of *Die Heilige Familie* because, by means of a chemical process, they evaporated Bauer's criticism from its "fluid" state into a *crystalline*" state.

It follows that "institutions of mendicancy", the "baptismal certificate of adulthood", the "regions of pathos and thunder-like aspects", the "Mussulman conceptual affliction" *(Die Heilige Familie,* pp. 2, 3, 4 according to the critical *Literatur-*

Zeitung) — all this is nonsense only if it is understood in the "crystalline" manner. And the twenty-eight historical howlers of which criticism was proved guilty in its excursion on "Englische Tagesfragen" [article by Julius Faucher] — are they not errors when looked at from the "fluid" point of view? Does criticism insist that, from the fluid point of view, it prophesied *a priori* the Nauwerck conflict [5] — long after this had taken place before its eyes — and did not construct it *post festum*? Does it still insist that the word marichal could mean "*farrier*" from the "crystalline" point of view, but from the "fluid" point of view at any rate must mean marshal"? Or that although in the "crystalline" conception "*un fait physique*" may mean "a physical fact", the true "fluid" translation should be "a fact of physics"? Or that "*la malveillance de nos bourgeois juste-milieux*" [the ill will of our middle-of-the-road bourgeois] in the "fluid" state still means "the care-freeness of our good burghers"? Does it insist that, from the "fluid" point of view, "a child that does not, in its turn, become a father or mother is *essentially a* daughter"? That someone can have the task "of representing, as it were, the last tear of grief shed by the past"? That the various concierges, lions, grisettes, marquises, scoundrels and wooden doors in Paris in their "fluid" form are nothing but phases of the mystery "in whose concept in general it belongs to posit itself as limited and again to abolish this limitation which is posted by its universal essence, for precisely this essence is only the result of its inner self-distinction, its activity"[Bruno Bauer, "Charakteristik Ludwig Feuerbachs"]? That critical criticism in the "fluid" sense "pursues its path irresistibly, victorious and confident of victory", when in dealing with a question it first asserts that it has revealed its "true and general significance" and then admits that it "had neither the will nor the right to go beyond criticism", and finally admits that "it had still to take one step but that step was impossible because — it was impossible" (*Die Heilige Familie*, p. 184)? That from the "fluid" point of view "the future is still the work" of criticism, although "fate may *decide* as it will" [B. Bauer, "Neueste Schriften Über die Judenfrage"]? That from the fluid point of view criticism achieved nothing superhuman when it "came into contradiction with its *true elements* — a *contradiction* which had already found its *solution* in *these same elements* [B. Bauer, "Was ist jetzt der Gegenstand der Kritik?"]?

The authors of *Die Heilige Familie* have indeed committed the frivolity of conceiving these and hundreds of other statements as statements expressing firm, "crystalline" *nonsense* — but the synoptic gospels should be read in a "fluid" way, i.e., according to the sense of their authors. and on no account in a "crystalline" way, e., according to their actual nonsense, in order to arrive at true faith and to admire the harmony of the critical household.

"Engels and Marx, therefore, know only the criticism of the Literatur-Zeitung" [Bruno Bauer, "Charakteristik Ludwig Feuerbachs"]

— a deliberate lie, proving how "fluidly" our saint has read a book in which his latest works are depicted merely as the culmination of all the "work he has done". But the church father lacked the calm to read in a crystalline way, for he fears his opponents as rivals who contest his canonisation and "want to deprive him of his sanctity, in order to make *themselves* sanctified".

Let us, incidentally, note the fact that, according to Saint Bruno's present statement, his *Literatur-Zeitung* by no means aimed at founding "social society" or at "representing, as it were, the last tear of grief" shed by German ideology, nor did it aim at putting mind in the sharpest opposition to the mass and developing critical criticism in all its purity, but only — at "depicting the liberalism and radicalism of 1842 and their echoes in their half-heartedness and phrase-mongering", hence at combating the "echoes" of what has long disappeared. *Tant de bruit pour une omelette!* [Much ado about an omelette! An exclamation which Jacques Vallé, Sieur des Barreaux, is supposed to have made when a thunderstorm occurred while he was eating an omelette on a fast-day] Incidentally, it is just here that the conception of history peculiar to German theory is again shown in its "purest" light. The year 1842 is held to be the period of the greatest brilliance of German liberalism, because at that time philosophy took part in politics. Liberalism vanishes for the critic with the cessation of the *Deutsche Jahrbücher* and the *Rheinische Zeitung*, the organs of liberal and radical theory. After that, apparently, there remain only the "echoes" — whereas in actual fact only now, when the German bourgeoisie feels a real need for political power, a need produced by economic relations, and is striving to satisfy has liberalism in Germany an actual existence and thereby 1 the chance of some success.

Saint Bruno's profound distress over *Die Heilige Familie* did not allow him to criticise this work "out of himself, through himself and with himself". To be able to master his pain he had first to obtain the work in a "fluid" form. He found this fluid form in a confused review, teeming with misunderstandings, in the *Westphälische Dampfboot*, May issue, pp. 206-14 All his quotations are taken from passages quoted in the *Westphälische Dampfboot* and he quotes nothing that is not quoted there.

The language of the saintly critic is likewise determined by the language of the Westphalian critic. In the first place, all the statements from the Foreword which are quoted by the Westphalian (Dampfboot, p. 206) are transferred to the *Wigand'sche Vierteljahrsschrift* (pp. 140, 141). This transference forms the chief part of Bauer's criticism, according to the old principle already recommended by Hegel:

"To trust common sense and, moreover, in order to keep up with the times and advance with philosophy, to read reviews of philosophical works, perhaps even their prefaces and introductory paragraphs; for the latter give the general principles on which everything turns, while the former give, along with the historical information, also an appraisal which, because it is an appraisal, even

goes beyond that which is appraised This beaten track can be followed in one's dressing-gown; but the elevated feeling of the eternal, the sacred, the infinite, pursues its path in the vestments of a high priest, a path" which, as we have seen, Saint Bruno also knows how to "pursue" while "striking down" (Hegel, Phänomenologie, p. 54).

The *Westphalian* critic, after giving a few quotations from the preface, continues:

"Thus the preface itself leads to the battlefield of the book", etc. (p. 206).

The *saintly* critic, having transferred these quotations into the *Wigand'sche Vierteljahrsschrift*, makes a more subtle distinction and says:

"Such is the terrain and the enemy which Engels and Marx have created for battle."

From the discussion of the critical proposition: "the worker creates nothing", the *Westphalian* critic gives only the summarising *conclusion.*

The *saintly* critic actually believes that this is all that was said about the proposition, copies out the Westphalian quotation on page 141 and rejoices at the discovery that only "assertions" have been put forward in opposition to criticism.

Of the examination of the critical outpourings about love, the *Westphalian* critic on page 209 first writes out the *corpus delicti* in part and then a few disconnected sentences from the refutation, which he desires to use as an authority for his nebulous, sickly-sweet sentimentality.

On pages 141-42 the *saintly* critic copies him out word for word, sentence by sentence, in the same order as his predecessor quotes.

The *Westphalian* critic exclaims over the corpse of Herr Julius Faucher: "Such is the fate of the beautiful on earth!". [Schiller. Wallenstein's Tod, Act IV, Scene 12]

The *saintly* critic cannot finish his "hard work" without appropriating this exclamation to use irrelevantly on page 142.

The *Westphalian* critic on page 212 gives a would-be summary of the arguments which are aimed against Saint Bruno himself in *Die Heilige Familie.*

The *saintly* critic cheerfully and literally copies out all this stuff together with all the Westphalian exclamations. He has not the slightest idea that *nowhere* in the whole of this polemic discourse does anyone reproach hint for "transforming the problem of political emancipation into that of human emancipation", for "wanting to kill the Jews", for "transforming the Jews into theologians", for "transforming Hegel into Herr Hinrichs", etc. Credulously, the saintly critic repeats the *Westphalian* critic's allegation that in *Die Heilige Familie Marx* volunteers to provide some sort of little scholastic treatise “in reply to Bauer’s *silly self-apotheosis*”. Yet the words “silly self-apotheosis”, which Saint Bruno gives as a *quotation*, are nowhere to be found in the whole of *Die Heilige Familie*, but they do occur with the Westphalian critic. Nor is the little treatise offered as a reply to the “self-*apology*” of criticism on pages 150-63 of *Die Heilige Familie*, but only in the following section on page 165, in connection with the world-historic question: “Why did Herr Bauer *have to* engage in politics?”

Finally on page 143 Saint Bruno presents *Marx* as an “*amusing comedian*”, here again following his Westphalian model, who resolved the “world-historic drama of critical criticism”, on page 213, into a “*most amusing comedy*”.

Thus one sees how the opponents of critical criticism “dare and can” “know *how the critic has worked, and still works*"!

4. Obituary For “M. Hess”

“What Engels and Marx could not yet do, M. Hess has accomplished.”

Such is the great, divine transition which — owing to the relative “can” and “cannot” be done of the evangelists — has taken so firm a hold of the holy man’s fingers that it has to find a place, relevantly or irrelevantly, in every article of the church father.

“What Engels and Marx could not yet do, M. Hess has accomplished.” But what is this “what” that “Engels and Marx could not yet do"? Nothing more nor less, indeed, than — to criticise Stirner. And why was it that Engels and Marx “could *not yet*” criticise Stirner? For the sufficient reason that — Stirner’s book *had not yet appeared* when they wrote *Die Heilige Familie.*

This speculative trick — of joining together everything and bringing the most diverse things into an apparent causal relation — has truly taken possession not only of the head of our saint but also of his fingers. With him it has become devoid of any contents and degenerates into a burlesque manner of uttering tautologies with an important mien. For example, already in the *Allgemeine Literatur-Zeitung* (1, 5) we read:

“The difference between my work and the pages which, for example, a Philippson covers with writing” (that is, the empty pages on which, “for example, a Philippson” writes) “must, therefore, be so constituted as in fact it is"!!! [Bauer, “Neueste Schriften über die Judenfrage"]

“M. Hess”, for whose writings Engels and Marx take absolutely no responsibility, seems such a strange phenomenon to the saintly critic that he is only capable of copying long excerpts from *Die letzten Philosophen* and passing the judgment that “on some points this criticism has not understood Feuerbach *or also*” (O theology!) “the vessel wishes to rebel against the potter”. Cf. Epistle to the Romans, 9: 20-21. Having once more performed the “hard work” of quoting, our saintly critic finally arrives at the conclusion that Hess copies from *Hegel,* since he uses the two words “united” and “development”. Saint Bruno, of course, had in a round-about way to try to turn against Feuerbach the proof given in *Die Heilige Familie* of his own complete dependence on Hegel. “See, that is how Bauer had to end! He fought as best he could against all the Hegelian categories”, with the exception of selfconsciousness — particularly in the glorious struggle of the *Literatur-Zeitung* against Herr Hinrichs. How he fought and conquered them we have already seen. For good measure, let us quote *Wigand*, page 110, where he asserts that

the “true” (1) “solution” (2) “of contradictions” (3) “in nature and history” (4), the “true unity” (5) “of separate relations” (6), the “genuine” (7) “basis” (8) “and abyss” (9) “of religion, the truly infinite” (10), “irresistible, self-creative” (11) “personality” (12) “has not yet been found”.

These three lines contain not two doubtful Hegelian categories, as in the case of Hess, but a round dozen of "true, infinite, irresistible" Hegelian categories which reveal themselves as such by ',the true unity of separate relations" — "see, that is how Bauer had to end"! And if the holy man thinks that in Hess he has discovered a Christian believer, not because Hess "hopes" — as Bruno says — but because he does not hope and because he talks of the "resurrection", then our great church father enables us, on the basis of this same page 1 10, to demonstrate his very pronounced *Judaism*. He declares there

"that the true, living man in the flesh has not yet been born"!!! (a new elucidation about the determination of the "unique sex") "and the mongrel produced" (Bruno Bauer?!?) "is not yet able to master all dogmatic formulas", etc.

That is to say, the *Messiah* is not yet born, the *son of man* has first to come into the world and this world, being the world of the Old Testament, is still under the rod of the *law*, of "dogmatic formulas". Just as Saint Bruno, as shown above, made use of "Engels and Marx" for a transition to Hess, so now the latter serves him to bring Feuerbach finally into causal connection with his excursions on Stirner, *Die* heilige Familie and *Die letzten Philosophen.*

"See, that is how Feuerba.ch had to end!" "Philosophy had to end piously", etc. (Wigand, p. 145.)

The true causal connection, however, is that this exclamation is an imitation of a passage from Hess' *Die letzten Philosophen* aimed against Bauer, among others (Preface, p. 4):

"Thus, [...] and in no other way had the last offspring of the Christian ascetics to take farewell of the world."

Saint Bruno ends his speech for the prosecution against Feuerbach and his alleged accomplices with the reproach to Feuerbach that all he can do is to "trumpet", to "blow blasts on a trumpet", whereas Monsieur B. Bauer or Madame la critique, the "mongrel produced", to say nothing of the continual "destruction", "*drives forth in his triumphal chariot and gathers new triumphs*" (p. 125), "hurls down from the throne" (p. 119), "slays" (p. 111), "strikes down like thunder" (p. 115), "destroys once and for all" (p. 120), "shatters" (p. 121), allows nature merely to "vegetate" (p. 120), builds "stricter" (!) "prisons" (p. 104) and, finally, with "crushing" pulpit eloquence expatiates, on p. 105, in a brisk, pious, cheerful and free ["Brisk, pious, cheerful and free" ("frisch, fromm, fröhlich und frei") — the initial words of a students' saying, which were turned by Ludwig Jahn into the motto of the sport movement he initiated] fashion on the "stably-strongly-firmly-existing", hurling "rock-like matter and rocks" at Feuerbach's head (p. 110) and, in conclusion, by a side thrust vanquishes Saint Max as well, by adding "the most abstract abstractness" and "the hardest hardness" (on p. 124) to "critical criticism", "social society" and "rock-like matter and rocks".

All this Saint Bruno accomplished "through himself, in himself and with himself", because he is "He himself"; indeed, he is "himself always the greatest and can always be the greatest" (*is* and *can* be!) "through himself, in himself and with himself" That's that.

Saint Bruno would undoubtedly be dangerous to the female sex, for he is an "irresistible personality", if "in the same measure on the other hand" he did not fear "sensuousness as the barrier against which man has to deal himself a mortal *blow*". Therefore, "through himself, in himself and with himself" he will hardly pluck any flowers but rather allow them to wither in infinite longing and hysterical yearning for the "irresistible personality", who "possesses this unique sex and these unique, particular sex organs".

[The following passage is crossed out in the manuscript:]

5. Saint Bruno in His “Triumphal Chariot”

Before leaving our church father “victorious and confident of victory”, let us for a moment mingle with the gaping crowd that comes up running just as eagerly when he “drives forth in his triumphal chariot and gathers new triumphs” as when General Tom Thumb with his four ponies provides a diversion. It is not surprising that we hear the humming of street-songs, for to be welcomed with street-songs “belongs after all to the concept” of triumph “in general”.

Footnotes

1. Positive philosophy” — a mystical religious trend (Christian Hermann Weisse, Immanuel Hermann Fichte Junior, Anton Günther, Franz Xaver von Baader, and Friedrich Schelling in his late period), which criticised Hegel’s philosophy from the right. The “positive philosophers” tried to make philosophy subservient to religion, denied the possibility of rational cognition and proclaimed divine revelation the only source of “positive” knowledge. They called “negative” every philosophy which recognised rational cognition as its source

2. Oregon was claimed by both the U.S.A. and Britain. The struggle for the possession of Oregon ended in June 1846 with the division of the territory between the U.S.A. and Britain.

3. The Anti-Corn Law League was founded in 1838 by the Manchester manufacturers Cobden and Bright. The English Corn Laws, first adopted in the 15th century, imposed high tariffs on imported cereals in order to maintain high prices for them in the home market. In the first third of the 19th century, in 1815, 1822 and later, several laws were passed changing the conditions for corn imports, and in 1828 a sliding scale was introduced which raised import tariffs on corn when prices in the home market declined and, on the other hand, lowered tariffs when prices rose in Britain. The League widely exploited the popular discontent over the raising of corn prices. In its efforts to obtain the repeal of the Corn Laws and the establishment of complete freedom of trade, it aimed at weakening the economic and political positions of the landed aristocracy and lowering the cost of living thus making possible a lowering of the workers’ wages. The struggle between the industrial bourgeoisie and the landed aristocracy over the Corn Laws ended with the repeal of these laws in 1846.

4. The expression “to fight like Kilkenny cats” originated at the end of the 18th century. During the Irish uprising of 1798 the town of Kilkenny was occupied by Hessian mercenaries serving in the British army, who used to amuse themselves by watching fights between cats with their tails tied together. One day, a soldier, seeing

an officer approaching, cut off the cats' tails with his sword and the cats ran away. The officer was told that the cats had eaten each other and only their tails remained

5. An allusion to the conflict between the Young Hegelian Karl Nauwerck and the professors of the Faculty of Philosophy at Berlin University (see Chapter III of The Holy Family, the MECW, Vol. 4, pp. 17-18)

Part III: Saint Max

The structure of this chapter parodies Stirner's manner of presenting his material. In his book Der Einzige und sein Eigenthum Stirner often interrupts his exposition with "episodical insertions" which are not directly connected with the subject-matter. Poking fun at this manner, Marx and Engels begin the chapter with a reference to Stirner's article "Recensenten Stirners" (published in Wigand' Vierteljahrsschrift, Vol. 3), which they ironically call "Apologetical Commentary". It is Stirner's reply to the criticism of his book by Szeliga, Feuerbach and Hess. Then follows a lengthy "episodical insertion", which takes up nearly the whole of this long chapter. It contains a critical analysis of Stirner's book, and only at the end of the chapter, in Section 2, do Marx and Engels return to the above-mentioned article. The structure of the "episode" corresponds to that of the book they criticised, and, just like the latter, it comprises two parts ironically entitled "The Old Testament: Man", and "The New Testament: 'Ego"'. The corresponding parts in Stirner's book are entitled "Der Mensch" ("Man") and "Ich" ("Ego"). In the subheadings Marx and Engels also use the names of chapters and sections of Stirner's book, in many cases giving them an ironical twist

"Was jehen mir die jrinen Beeme an?"

["What are the green trees to me?" — a paraphrase (in the Berlin dialect) from Heine's work Reisebilder, Dritter Teil "Die Bäder von Lucca", Kapitel IV]

Saint Max exploits, "employs" or "uses" the Council to deliver a long apologetic commentary on "*the book*", which is none other than "*the* book", the book as such, the book pure and simple, i.e., the perfect book, the Holy Book, the book as something holy, the book as the holy of holies, the book in heaven, viz., *Der Einzige und sein Eigenthum*. "The book", as we know, *fell* from the heavens towards the end of 1844 and took on the shape of a servant with O. Wigand in Leipzig [1]. It was, therefore, at the mercy of the vicissitudes of terrestrial life and was attacked by three "unique ones", viz., the mysterious personality of *Szeliga*, the gnostic *Feuerbach* and *Hess*. [Szeliga, "Der Einzige und sein Eigenthum"; Feuerbach, "Über das 'Wesen des Christenthums' in Beziehung auf den 'Einzigen und sein Eigenthum"'; Hess, Die letzten Philosophen] However much at every moment Saint Max as creator towers over himself as a creation, as he does over his other creations, he nevertheless took pity on his weakly offspring and, in order to defend it and ensure its safety, let out a loud "critical hurrah". In order to fathom in all their significance both this "critical hurrah" and *Szeliga's* mysterious personality, we must here, to some extent, deal with church history and look more closely at "the book".

Or, to use the language of Saint Max: we "shall episodically put" "into this passage" a church-historical "meditation" on *Der Einzige und sein Eigenthum* "simply because" "it seems to us that it could contribute to the elucidation of the rest".

"Lift up your heads, O ye gates; and be ye lift up, ye everlasting doors; and the King of Glory shall come in.

"Who is this King of Glory? The War-Lord strong and mighty, the War-Lord mighty in battle.

"Lift up your heads, 0 ye gates; even lift them up, ye everlasting doors; and the King of Glory, shall come in.

"Who is this King of Glory? The Lord Unique, he is the King of Glory," (Psalms, 24:7-10).

Part I. The Unique and His Property

The man who "has based his cause on nothing' [here and below Marx and Engels paraphrase the first lines of Goethe's poem Vanitas! Vanitatum Lanitas!] begins his lengthy "critical hurrah" like a good German, straightway with a Jeremiad: "Is there anything that is not to be my cause?" (p. 5 of the "book"). And he continues lamenting heart-rendingly that "everything is to be his cause", that "God's cause, the cause of mankind, of truth and freedom, and in addition the cause of his people, of his lord", and thousands of other good causes, are imposed on him. Poor fellow! The French and English bourgeois complain about lack of markets, trade crises, panic on the stock exchange, the political situation prevailing at the moment, etc.; the German petty bourgeois, whose active participation in the bourgeois movement has been merely an ideal one, and who for the rest exposed only himself to risk, sees his own cause simply as the "good cause", the "cause of freedom, truth, mankind", etc.

Our German school-teacher simply believes this illusion of the German petty bourgeois and on three pages he provisionally discusses all these good causes.

He investigates "God's cause", "the cause of mankind" (pp. 6 and 7) and finds these are "purely egoistical causes", that both "God" and "mankind" worry only about what is *theirs*, that "truth, freedom, humanity, justice" are "only interested in themselves and not in us, only in their own well-being and not in ours" — from which he concludes that all these persons "are thereby exceptionally well-off". He goes so far as to transform these idealistic phrases — God, truth, etc. — into prosperous burghers who "are exceptionally well-off" and enjoy a "*profitable* egoism". But this vexes the holy egoist: "And I?" he exclaims.

"I, for my part, draw the lesson from this and, instead of continuing to serve these great egoists, I should rather be an egoist myself!" (p. 7)

Thus we see what holy motives guide Saint Max in his transition to egoism. It is not the good things of this world, not treasures which moth and rust corrupt, not the capital belonging to his fellow unique ones, but heavenly treasure, the capital which belongs to God, truth, freedom, mankind, etc., that gives him no peace.

If it had not been expected of him that he should serve numerous good causes, he would never have made the discovery that he also has his "own" cause, and therefore he would never have based this cause of his "on nothing" (i.e., the "book").

If Saint Max had looked a little more closely at these various causes" and the "owners" of these causes, e.g., God, mankind, truth, he would have arrived at the opposite conclusion: that egoism based on the egoistic mode of action of these persons must be just as imaginary as these persons themselves.

Instead of this, our saint decides to enter into competition with "God" and "truth" and to base his cause on himself —

"on myself, on the I that is, just as much as God, the nothing of everything else, the I that is everything for me, the I that is the unique.... I am nothing in the sense of void, but the creative nothing, the nothing from which I myself, as creator, create everything."

The holy church father could also have expressed this last proposition as follows: I am everything in the void of nonsense, "*but*" I am the nugatory creator, the all, from which I myself, as creator, create nothing.

Which of these two readings is the correct one will become evident later. So much for the preface.

The "book" itself is divided like the book "of old", into the Old and New Testament — namely, into the unique history of man (the Law and the Prophets) and the inhuman history of the unique (the Gospel of the Kingdom of God). The former is history in the framework of logic, the logos confined in the past; the latter is logic in history, the emancipated logos, which struggles against the present and triumphantly overcomes it.

The Old Testament: Man [2]

1. The Book of Genesis, i.e., A Man's Life

Saint Max pretends here that he is writing the *biography* of his mortal enemy, "*man*", and not of a "*unique*" or "real individual". This ties him up in delightful contradictions.

As becomes every normal genesis "a man's life" begins *ab ovo,* with the "child". As revealed to us on page 13, the child

"from the outset lives a life of struggle against the entire world, it resists everything and everything resists it". "Both remain enemies" but "with awe and respect" and "are constantly on the watch, looking for each other's weaknesses".

This is further amplified, on page 14:

"we", as children, "try to find out the basis of things or what lies behind them; therefore" (so no longer out of enmity) "we are trying to discover everybody's weaknesses". (Here the finger of Szeliga, the mystery-monger, is evident.)

Thus, the *child* immediately becomes a *metaphysician*, trying to find out the "*basis* of things". This *speculating* child, for whom "the nature of things" lies closer to his heart than his toys, "sometimes" in the long run, succeeds in coping with the "world of things", conquers it and then enters a new phase, the *age of youth*, when he has to face a new "'arduous struggle of life", the struggle against reason, for the "*spirit means the first self-discovery*" and: "We are above the world, we are spirit" (p. 15). The point of view of the youth is a "heavenly one"; the child merely "*learned*", "he did not dwell on purely logical or theological problems" —*just as* (the child) "Pilate" hurriedly passed over the question: "What is truth?" (p. 17). The youth "tries to master thoughts", he "understands ideas, the *spirit*" and "seeks ideas"; he "is engrossed in thought" (p. 16), he has "absolute thoughts, i.e., *nothing but thoughts,* logical thoughts". The youth who thus "deports himself", instead of chasing after young women and other earthly things, is no other than the young "Stirner", the studious Berlin youth, busy with Hegel's logic and gazing with amazement at the great Michelet. Of *this* youth it is rightly said on page 17:

"to bring to light pure thought, to devote oneself to it — in this is the joy of youth, and all the bright images of the world of thought — truth, freedom, mankind, Man, etc. — illumine and inspire the youthful soul."

This youth then "throws aside" the "object" as well and "occupies himself" exclusively "with his thoughts";

“he includes all that is not spiritual under the contemptuous name of external things, and if, all the same, he does cling to such external things as, for example, students’ customs, etc., it happens only when and because he discovers spirit in them, i.e., when they become symbols for him”. (Who will not “discover” “Szeliga” here?)

Virtuous Berlin youth! The beer-drinking ritual of the students’ association was for him only a “symbol” and only for the sake of the “symbol” was he after a drinking bout many a time found under the table, where he probably also wished to “discover spirit"! — How virtuous is this good youth, whom old *Ewald,* who wrote two volumes on the “virtuous youth”, [Johann Ludwig Ewald, Der gute Jüngling, gute Gatte und Vater, oder Mittel, um es zu werden.] could have taken as a model, is seen also from the fact that it was “made known” to him (p. 15): “Father and mother should be abandoned, all natural authority should be .considered broken.” For him, “the rational man, the family as a natural authority does not exist; there follows a renunciation of parents, brothers and sisters, etc.” — But they are all “re-born as *spiritual*, *rational* authority”, thanks to which the good Youth reconciles obedience and fear of one’s parents with his speculating conscience, and everything remains as before. Likewise “it is said” (p. 15): “We ought to obey God rather than men.” [The Acts of the Apostles 5: 29] Indeed, the good youth reaches the highest peak of morality on page 16, where “it is said": “One should obey one’s conscience rather than God.” This moral exultation raises him even above the “revengeful Eumenides” and even above the “anger of Poseidon” — he is afraid of nothing so much as his “conscience”. Having discovered that “the spirit is the essential” he no longer even fears the following perilous conclusions:

“If, however, the spirit is recognised as the essential, nevertheless it makes a difference whether the spirit is poor or rich, and therefore” (!) “one strives to become rich In spirit; the spirit wishes to expand, to establish its realm, a realm not of this world, which has just been overcome. In this way, the spirit strives to become all in all” [1 Corinthians 15:28] (what way is this?), “i.e., although I am spirit, nevertheless I am not perfect spirit and must” (?) “first seek the perfect spirit” (p. 1 7).

“Nevertheless *it* makes a difference.” — *It*”, what is this? What is the “It” that makes the differences We shall very often come across this mysterious “It” in our holy man, and it will then turn out that it is the unique from the standpoint of *substance,* the beginning of “unique” logic, and as such the true identity of Hegel’s “being” and “nothing”. Hence, for everything that this “It” does, says or performs, we shall lay the responsibility on our saint, whose relation to it is that of its creator. First of all, this “It”, as we have seen, makes a difference between poor and rich. And why? Because “the spirit is recognised as the essential”. Poor “It”, which without this recognition would never have arrived at the difference between poor and rich! “And therefore *one* strives", etc. "*One!*" We have here the second impersonal person which, together with the "It", is in Stirner's service and must perform the heaviest menial work for him. How these two are accustomed to support each other is clearly seen here. Since "It" makes a difference whether the spirit is poor or rich, lone" (could anyone but Stirner's faithful servant [F. Szeliga] have had this idea!) — "*one, therefore,* strives to become rich in spirit". "It" gives the signal and immediately "one" joins in at the top of its voice. The division of labour is classically carried out.

Since "one strives to become *rich in spirit, the spirit* wishes to expand, to establish *its realm*", etc. "If however" a connection is present here "it still makes a difference" whether "one" wants to become "*rich in spirit*" or whether "*the spirit* wants to establish its realm". Up to now "*the spirit*" has *not* wanted *anything*, "*the spirit*" has not yet figured as a *person* — it was only a matter of the spirit of the "youth", and not of "*the spirit*" as such, of the spirit as *subject.* But our holy writer now needs a spirit different from that of the youth, in order to place it in opposition to the latter as a foreign, and in the last resort, as a holy spirit. *Conjuring trick* No. 1.

"In this way the spirit strives to become all in all", a somewhat obscure statement, which is then explained as follows:

"Although I am spirit, nevertheless I am not perfect spirit and must first seek the perfect spirit."

But if Saint Max is the "Imperfect spirit", "nevertheless it makes a difference" whether he has to "*perfect*" *his* spirit or seek "*the perfect* spirit". A few lines earlier he was in fact dealing only with the "poor" and "rich" spirit — a quantitative, profane distinction — and now there suddenly appears the "*imperfect*" and "*perfect*" spirit — a qualitative, mysterious distinction. The striving towards the development of one's own spirit can now be transformed into the hunt of the "imperfect spirit" for "*the* perfect spirit". The holy spirit wanders about like a ghost. *Conjuring trick* No. 2. The holy author continues:

"But thereby" (i.e., by the transformation of the striving towards "perfection" my spirit into the search for "the perfect spirit") " I, who have only just found myself as spirit, at once lose myself again, in that I bow down before the perfect spirit, as a spirit which is not my own, but a spirit of the beyond, and I feel my emptiness " (p. 18).

This is nothing but a further development of conjuring trick No. 2. After the "perfect spirit" has been *assumed* as an *existing being* and opposed to the "imperfect spirit", it becomes obvious that the "imperfect spirit", the youth, painfully feels his "emptiness" to the depths of his soul. Let us go on!

"True, it is all a matter of spirit, but is every spirit the right spirit? The right and true spirit is the ideal of the spirit, the 'holy spirit'. It is not my or your spirit

but precisely" (!) — "an ideal spirit, a spirit of the beyond — 'God'. 'God is spirit" [John 4: 24] (p. 18).

Here the "perfect spirit" has been suddenly transformed into the "right" spirit, and immediately afterwards into the "right and true spirit". The latter is more closely defined as the "Ideal of the spirit, the holy spirit" and this is proved by the fact that it is "not my or your spirit but *precisely,* a spirit of the beyond, an ideal spirit — God". The true spirit is the *ideal* of the spirit, "precisely" because it is *ideal*! It is the holy spirit "precisely" because it is — God! What "virtuosity of thought"! We note also in passing that up to now nothing was said about "your" spirit. Conjuring trick No. 3.

Thus, if I seek to train myself as a mathematician, or, as Saint Max puts it, to "perfect" myself as a mathematician, then I am seeking the "perfect" mathematician, i.e., the "right and true" mathematician, the "ideal" of the mathematician, the "holy" mathematician, who is distinct from me and you (although in my eyes you may be a perfect mathematician, just as for the Berlin youth his professor of philosophy is the perfect spirit); but a mathematician who is "precisely ideal, of the beyond", the mathematician in the heavens, "God". God is a mathematician.

Saint Max arrives at all these great results because "it makes a difference whether the spirit is rich or poor"; i.e., in plain language, it makes a difference whether anyone is rich or poor in spirit, and because his "youth" has discovered this remarkable fact.

On page 18 Saint Max continues:

"It divides the man from the youth that the former takes the world as it is", etc.

Consequently, we do not learn how the youth arrives at the point where he suddenly takes the world "as it is", nor do we see our holy dialectician making the transition from youth to man, we merely learn that "*It*" has to perform this service and "*divide*" the youth from the man. But even this "It" by itself does not suffice to bring the cumbersome wagon-load of unique thoughts into motion. For after "It" has "divided the man from the youth", the man all the same relapses again into the youth, begins to occupy himself afresh "exclusively with the spirit" and does not get going until "one" hurries to his assistance with a change of horses. "Only when one has grown fond of oneself *corporeally*, etc." (p. 18), "only then" everything goes forward smoothly again, the man discovers that he has a personal interest, and arrives at "the *second self-discovery*", *in* that he not only "finds himself as spirit", like the youth, "and then at once loses himself again in the universal spirit", but finds himself "as *corporeal* spirit" (p. 19). This "corporeal spirit" finally arrives at having an "interest not only in its own spirit" (like the youth), "but in total satisfaction, in the satisfaction of the whole fellow" (an interest in the satisfaction of the whole fellow!) — he arrives at the point where "he is pleased with himself exactly as he is". Being a German, Stirner's "man" arrives at everything very late. He could see, sauntering along the Paris boulevards or in London's Regent Street, hundreds of "young men", fops and dandies who have not yet found themselves as "corporeal spirits" and are nevertheless "pleased with themselves exactly as they are", and whose main interest lies in the ',satisfaction of the whole fellow" This second "self-discovery" fills our holy dialectician with such enthusiasm that he suddenly forgets his role and begins to speak not of the *man*, but of *himself*, and reveals that he himself, he the unique, is "the man", and that "the man" = "the unique". A new conjuring trick.

"How I find myself" (it should read: "how the youth finds himself") "behind the things, and indeed as spirit, so subsequently, too, I must find myself" (it should read: "the man must find himself") "behind the thoughts, i.e., as their creator and owner. In the period of spirits, thoughts outgrew me" (the youth), "although they were the offspring of my brain; like delirious fantasies they floated around me and agitated me greatly, a dreadful power. The thoughts became themselves corporeal, they were spectres like God, the Emperor, the Pope, the Fatherland, etc,; by destroying their corporeality, I take them back into my own corporeality and announce: I alone am corporeal. And now I take the world as it is for me, as my world, as my property: I relate everything to myself."

Thus, the man, identified here with the "unique", having first given thoughts corporeality, i.e., having transformed them into spectres, now destroys this corporeality again, by taking them back into his own body, which he thus makes into a body of spectres. The fact that he arrives at his own corporeality only through the negation of the spectres, shows the nature of this constructed corporeality of the man, which he has first to "announce" to "himself", in order to believe in it. But what he "announces to himself" he does not even announce" correctly. The fact that apart from his "unique" body there are not also to be found in his head all kinds of independent bodies, spermatozoa, he transforms into the "*fable*": I *alone* am corporeal. Another conjuring trick.

Further, the man who, as a youth, stuffed his head with all kinds of nonsense about existing powers and relations such as the Emperor, the Fatherland, the State, etc., and knew them only as his own "delirious fantasies", in the form of his conceptions — this man, *according to Saint Max, actually destroys all these powers* by getting out of his head his false opinion of them. On the contrary: now that he no longer looks at the world through the spectacles of his fantasy, he has to think of the practical interrelations of the world, to get to know them and to act in accordance with them. By destroying the *fantastic* corporeality which the world had for him, he finds its real corporeality outside his fantasy. With the disappearance of the *spectral* corporeality of the Emperor, what disappears for him is not the corporeality, but the *spectral* *character* of the Emperor, the actual power of whom he can now at last appreciate in all its scope. Conjuring trick No. 3[a].

The youth as a man does not even react critically towards ideas which are valid also for others and are current as categories, but is critical only of those ideas that are the "mere offspring of his brain", i.e., general concepts about existing conditions reproduced in his brain. Thus, for example, he does not even resolve the *category* "Fatherland", but only his personal opinion of this category, after which the *generally valid* category still remains, and even in the sphere of "philosophical thought" the work is only just beginning. He wants, however, to make us believe that he has destroyed the category itself because he has destroyed his emotional personal relation to it — exactly as he has wanted to make us believe that he has destroyed the power of the Emperor by giving up his fantastic conception of the Emperor. Conjuring trick No. 4.

"And now," continues Saint Max, "I take the world as it is for me, as my world, as my property."

He takes the world as it is for him, i.e., *as he is compelled to take it.* and thereby he has *appropriated* the world for himself, has made it his property — a mode of acquisition which, indeed, is not mentioned by any of the economists, but the method and success of which will be the more brilliantly disclosed in "the book". Basically, however, he takes" not the "world", but only his "delirious fantasy" about the world as his own, and makes it his property. He takes the world as his conception of the world, and the world as his conception is his imagined property, the property of his conception, his conception as property, his property as conception, his own peculiar conception, or his conception of property; and all this he expresses in the incomparable phrase: "I relate everything to myself."

After the man has recognised, as the saint himself admits, that the world was only populated by spectres, because the youth saw spectres, after the *illusory world* of the youth has disappeared for the man, the latter finds himself in a *real* world, independent of youthful fancies.

And so, it should therefore read, I take the world as it is *independently of myself*, in the form in which it *belongs to itself* ("the man takes" — see page 18 — "the world as it is", and not as he would like it to be), in the first place as my non-property (hitherto it was my property only as a spectre); I relate myself to everything and only to that extent do I relate everything to I myself.

"If I as spirit rejected the world with the deepest contempt for it, then I as proprietor reject the spectres or ideas into their emptiness. They no longer have power over me, just as no 'earthly force' has power over the spirit" (p. 20).

We see here that the proprietor, Stirner’s man, at once enters into possession, *sine beneficio deliberandi atque inventarii*, [without the advantage of deliberation and inventory — the right of deliberation and inventory is an old principle of the law of inheritance, which grants the heir time to decide whether he wants to accept or to reject a legacy] of the inheritance of the youth which, according to his own statement, consists only of “delirious fantasies” and “spectres”. He believes that in the process of changing from a child into a youth he had truly coped with the world of things, and in the process of changing from a youth into a man he had truly coped with the world of the spirit, that now, as a man, he has the whole world in his pocket and has nothing more to trouble him. If, according to the words of the youth which he repeats, no earthly force outside him has any power over the spirit, and hence the spirit is the supreme power on earth — and he, the man, has forced this omnipotent spirit into subjection to himself — is he not then completely omnipotent? He forgets that he has only destroyed the fantastic and spectral form assumed by the idea of “Fatherland”, etc., in the brain of the “youth”, but that he has still not touched these ideas, insofar as they express *actual* relations. Far from having become the master of ideas — he is only now capable of arriving at “ideas”.

“Now, let us say in conclusion, it can be clearly seen” (p. 199) that the holy man has brought his interpretation of the different stages of life to the desired and predestined goal. He informs us of the result achieved in a thesis that is a spectral shade which we shall now confront with its lost body.

unique thesis, p. 20.	**Owner of the accompanying liberated shade.**
“The child was realistic, in thrall to the things of this world, until little by little he succeeded in penetrating behind these very things. The youth was idealistic, inspired by thoughts, until he worked his way up to become a man, the egoistic man, who deals with things and thoughts as he pleases and puts his personal interest above everything. Finally, the old man? It will be time enough to speak of this when I become one.”	***The child was actually in thrall to the world of his things, until little by little (a borrowed conjuring trick standing for development) he succeeded in leaving these very things behind him. The youth was fanciful and was made thoughtless by his enthusiasm, until he was brought down by the man, the egoistic burgher, with whom things and thoughts deal as they please, because his personal interest puts everything above him. Finally, the old man? — “Woman, what have I to do with thee?” [John 2:4]***

The entire history of "a man's life" amounts, therefore, "let us say in conclusion", to the following:

1. Stirner regards the various stages of life only as "self-discoveries" of the individual, and these "self-discoveries" are moreover always reduced to a definite relation of consciousness. Thus the variety of *consciousness* is here the life of the individual. The physical and social changes which take place in the individuals and produce an altered consciousness are, of course, of no concern to Stirner. In Stirner's work, therefore, child, youth and man always find the world ready-made, just as they merely "find" "themselves"; absolutely nothing is done to ensure that there should be something which can in fact be found. But even the relation of *consciousness* is not correctly understood either, but only in its speculative distortion. Hence, too, all these figures have a philosophical attitude to the world — "the child is *realistic*", "the youth is *idealistic*", the man is the negative unity of the two, absolute negativity, as is evident from the above-quoted final proposition. Here the secret of "a man's life" is revealed, here it becomes clear that the "child" was only a disguise of "*realism*", the "*youth*" a disguise of "*idealism*", the "*man*" of an attempted *solution* of this *philosophical antithesis.* This solution, this "*absolute negativity*", is arrived at — it is now seen — only thanks to the man blindly taking on trust the illusions both of the child and of the youth, *believing* thus to have overcome the world of things and the world of the spirit.

2. Since Saint Max pays no attention to the physical and social "life" of the individual, and says nothing at all about "life", he quite consistently abstracts from historical epochs, nationalities, classes, etc., or, which is the *same thing,* he inflates the *consciousness* predominant in the class nearest to him in his immediate environment into the normal consciousness of "a man's life". In order to rise above this local and pedantic narrow-mindedness he has only to confront "his" youth with the first young clerk he encounters, a young English factory worker or young Yankee, not to mention the young Kirghiz-Kazakhs.

3. Our saint's enormous gullibility — the true spirit of his book — is not content with causing his youth to believe in his child, and his man to believe in his youth. The illusions which some youths", "men", etc., have or claim to have about themselves, are without any examination accepted by Stirner himself and confused with the "*life*", with the *reality*, of these highly ambiguous youths and men.

4. The prototype of the entire structure of the stages of life has already been depicted in the third part of Hegel's *Encyclopädie* and "in various transformations" in other passages in Hegel as well. Saint Max, pursuing "his own" purposes, had, of course, to undertake certain "transformations" here also. Whereas Hegel, for example, is still to such an extent guided by the empirical world that he portrays the German burgher as the servant of the world around him, Stirner has to make him the master of this world, which he is not even in imagination. Similarly, Saint Max pretends that he does not speak of the old man for empirical reasons; he wishes to wait until he becomes one himself (here, therefore, "a man's life" = his unique life). Hegel briskly sets about constructing the four stages of the human life because, in the real world, the negation is posited twice, i.e., as moon and as comet (cf. Hegel's *Naturphilosophie* , and therefore the quaternity here takes the place of the trinity. Stirner finds his own uniqueness in making moon and comet coincide and so abolishes the unfortunate old man from "a man's life". The reason for this conjuring trick becomes evident as soon as we examine the construction of the unique history of man.

2. The Economy of the Old Testament

We must here, for a moment, jump from the “Law” to the “Prophets”, since at this point already we reveal the secret of unique domestic economy in heaven and on earth. In the Old Testament, too — where the law, man, still is a school-master of the unique (Galatians 3:24) — the history of the kingdom of the unique follows a wise plan fixed from eternity. Everything has been foreseen and preordained in order that the unique could appear in the world, when the time had come [Galatians 4:4] to redeem holy people from their holiness.

The first book, “A Man’s Life”, is also called the “Book of Genesis”, because it contains in embryo the entire domestic economy of the unique, because it gives us a prototype of the whole subsequent development up to the moment when the time comes for the end of the world. The entire unique history revolves round three stages: child, youth and man, who return “in various transformations” and in ever widening circles until, finally, the entire history of the world of things and the world of the spirit is reduced to “child, youth and man”. Everywhere we shall find nothing but disguised 1I child, youth and man”, just as we already discovered in them three disguised categories.

We spoke above of the German philosophical conception of history. Here, in Saint Max, we find a brilliant example of it. The speculative idea, the abstract conception, is made the driving force of history, and history is thereby turned into the mere history of philosophy. But even the latter is not conceived as, according to existing sources, it actually took place — not to mention how it evolved under the influence of real historical relations — but as it was understood and described by recent German philosophers, in particular Hegel and Feuerbach. And from these descriptions again only that was selected which could be adapted to the given end, and which came into the hands of our saint by tradition. Thus, history becomes a mere history of illusory ideas, a history of spirits and ghosts, while the real, empirical history that forms the basis of this ghostly history is only utilised to provide bodies for these ghosts; from it are borrowed the names required to clothe these ghosts with the appearance of reality. In making this experiment our saint frequently forgets his role and writes an undisguised ghost-story.

In his case we find this method of making history in its most naive, most classic simplicity. Three simple categories — realism, idealism and absolute negativity (here named “*egoism*”) as the unity of the two — which we have already encountered in the shape of the child, youth and man, are made the basis of all history and are embellished with various historical signboards; together with their modest suite of auxiliary categories they form the content of all the allegedly historical phases which are trotted out. Saint Max once again reveals here his boundless faith by pushing to greater extremes than any of his predecessors faith in the speculative content of history dished up by German philosophers. In this solemn and tedious construction of history, therefore, all that matters is to find a pompous series of resounding names for three categories that are so hackneyed that they no longer dare to show themselves publicly under their own names. Our anointed author could perfectly well have passed from the "man" (p. 20) immediately to the "ego" (p. 201) or better still to the "unique" (p. 485); but that would have been too simple. Moreover, the strong competition among the German speculative philosophers makes it the duty of each new competitor to offer an ear-splitting historical advertisement for his commodity.

"The force of true development", to use *Dottore Graziano's* words, "proceeds most forcibly" in the following "transformations": Basis:

I. Realism.

II. Idealism.

III. The negative unity of the two. "One" (p. 485),

First nomenclature:

I.. Child, dependent on things (realism).

II. Youth, dependent on ideas (idealism).

III. Man — (as the negative unity)

expressed positively:

the owner of ideas and things (egoism)

expressed negatively:

free from ideas and things

Second, historical nomenclature:

I. Negro (realism, child).

II. Mongol (Idealism, youth).

III. Caucasian (negative unity of realism and idealism, man).

Third, most general nomenclature:

I. Realistic egoist (egoist in the ordinary sense) — child, Negro.

II. Idealist egoist (devotee) — youth, Mongol.

III. True egoist (the unique) — man, Caucasian.

Fourth, historical nomenclature. Repetition of the preceding stages within the category of the Caucasian.

I. *The Ancients.* Negroid Caucasians childish men — pagans dependent on things — realists — the world.

Transition (child penetrating behind the "things of this world"): Sophists, Sceptics, etc.

II. The *Moderns.* Mongoloid Caucasians — youthful men — Christians — dependent on ideas — idealists — spirit.

1. Pure history of spirits, [Geistergeschichte, or "ghost-story" Geister — ghosts or spirits; Geschichte — story or history; here rendered as "history of spirits"] Christianity as spirit. "The spirit."

2. Impure history of spirits. Spirit in relation to others. "The Possessed".

A. Purely impure history of spirits.

a) *The apparition*, the ghost, the spirit in the Negroid state, as thing-like spirit and spiritual thing — objective being for the Christian, spirit as child.

b) *The whimsy*, the fixed idea, the spirit in the Mongolian condition, as spiritual in the spirit, determination in consciousness, conceptual being in the Christian — spirit as youth.

B. Impurely impure (historical) history of spirits.

a) Catholicism — Middle Ages (the Negro, child, realism, etc.).

b) Protestantism — modern times in modern times (Mongol, youth, idealism, etc.).

Within Protestantism it is possible to make further subdivisions, for example:

[a] English philosophy — realism, child, Negro.

[b] German philosophy — idealism, youth, Mongol.

3. *The Hierarchy* — negative unity of the two within the Mongoloid-Caucasian point of view. Such unity appears where historical relations are changed into actually existing relations or where opposites are presented as existing side by side. Here, therefore, we have two coexisting stages:

A. *The "uneducated"*, (evil ones, bourgeois, egoists in the ordinary sense)=Negroes, children, Catholics, realists, etc.

B. *The "educated"* (good ones, *citoyens,* devotees, priests, etc.) = Mongols, youths, Protestants, idealists.

These two stages exist side by side and hence it follows easily" that the "educated" rule over the "uneducated" — this is the *hierarchy*. In the further course of historical development there arises then

the non-Hegelian from the "uneducated",

the Hegelian from the "educated",

["The shaman and the speculative philosopher denote the lowest and the highest point in the scale of the inner man, the Mongol" (p. 453).]

from which it follows that the Hegelians rule over the non-Hegelians. In this way Stirner converts the speculative notion of the domination of the speculative idea in history into the notion of the domination of the speculative philosophers themselves. The view of history hitherto held by him — the domination of the idea — becomes in the hierarchy a relation actually existing at present; it becomes the world domination of ideologists. This shows how deeply Stirner has plunged into speculation. This domination of the speculative philosophers and ideologists is finally developing, "for the time has come" for it, into the following, concluding nomenclature:

a) *Political liberalism*, dependent on things, independent of persons — realism, child, Negro, the ancient, apparition, Catholicism, the "uneducated", masterless.

b) *Social liberalism*, independent of things, dependent on the spirit, without object — idealism, youth, Mongol, the modern, whimsy, Protestantism, the "educated", propertyless.

c) *Humane liberalism*, masterless and propertyless, that is godless, for God is simultaneously the supreme master and the supreme possession, hierarchy — negative unity in the sphere of liberalism and, as such, domination over the world of things and thoughts; at the same time the perfect egoist in the abolition of egoism — the perfect hierarchy. At the same time, it forms the

Transition (youth penetrating behind the world of thoughts) to

III. the "*ego*" — i.e., the perfect Christian, the perfect man, the Caucasian Caucasian and true egoist, who — just as the Christian became spirit through the supersession of the ancient world — becomes a corporeal being [Leibhaftige] through the dissolution of the realm of spirits, by entering, *sine beneficio deliberandi et inventarii*, into the inheritance of idealism, the youth, the Mongol, the modern, the Christian, the possessed, the whimsical, the Protestant, the "educated", the Hegelian and the humane liberal.

NB. 1. "At times" Feuerbachian and other categories, such as reason, the heart, etc., may be also "included episodically", should a suitable occasion arise, to heighten the colour of the picture and to produce new effects. It goes without saying that these, too, are only new disguises of the ever present idealism and realism.

2. The very pious Saint Max, *Jacques le bonhomme*, has nothing real and mundane to say about real mundane history, except that under the name of "nature", the "world of things", the "world of the child", etc., he always opposes it to consciousness, as an object of speculation of the latter, as a world which, in spite of its continual annihilation, continues to exist in a mystical darkness, in order to reappear on every convenient occasion — probably because children and Negroes continue to exist, and hence also their world, the so-called world of things, "easily," continues to exist. Concerning such historical and non-historical constructions, good old *Hegel* wrote with regard to Schelling — the model for all constructors — that one can say the following in this context:

"It is no more difficult to handle the instrument of this monotonous formalism than a painter's palette which has only two colours, say black" (realistic, childish, Negroid, etc.) "and yellow" [Hegel mentions red and green as examples] (idealist, youthful, Mongolian, etc.), "in order to use the former to paint a surface when something historical" (the "world of things") "is required, and the latter when a landscape" ("heaven", spirit, holiness, etc.) "is needed" (Phänomenologie, p. 39).

"Ordinary consciousness" has even more pointedly ridiculed constructions of this kind in the following song:

The master sent out John

And told him to cut the hay;

But John did not cut the hay

Nor did he come back home.

Then the master sent out the dog

And told him to bite John;

But the dog did not bite John,

John did not cut the hay

And they did not conic back home.

Then the master sent out the stick

And told it to beat the dog;

But the stick did not beat the dog,

The dog did not bite John,
John did not cut the hay
And they did not come back home.
Then the master sent out fire
And told it to burn the stick;
But the fire did not burn the stick,
The stick did not beat the dog,
The dog did not bite John,
John did not cut the hay
And they did not come back home.
Then the master sent out water
And told it to put out the fire;
But the water did not put out the fire,
The fire did not burn the stick,
The stick did not beat the dog,
The dog did not bite John,
John did not cut the hay
And they did not come back home.
Then the master sent out the ox
And told it to drink the water;
But the ox did not drink the water,
The water did not put out the fire,
The fire did not burn the stick,
The stick did not beat the dog,
The dog did not bite John,
John did not cut the hay
And they did not come back home.
Then the master sent out the butcher

And told him to slaughter the ox;
But the butcher did not slaughter the ox,
The ox did not drink the water,
The water did not put out the fire,
The fire did not burn the stick,
The stick did not beat the dog,
The dog did not bite John,
John did not cut the hay
And they did not come back home.
Then the master sent out the hangman
And told him to hang the butcher;
The hangman did hang the butcher,
The butcher slaughtered the ox,
The ox drank the water,
The water put out the fire,
The fire burnt the stick,
The stick beat the dog,
The dog bit John,
John cut the hay,
And they all came back home.
[A German nursery rhyme]

We shall now see with what "virtuosity of thought" and with what school-boyish material Jacques le bonhomme elaborates on this scheme.

3. The Ancients

Properly speaking we ought to begin here with the Negroes; but Saint Max, who undoubtedly sits in the "Council of Guardians", in his unfathomable wisdom introduces the Negroes only later, and even then "without any claim to thoroughness and authenticity". if, therefore, we make Greek philosophy precede the Negro era, i.e., the campaigns of Sesostris and Napoleon's expedition to Egypt [3] it is because we are confident that our holy author has arranged everything wisely.

"Let us, therefore, take a look at the activities which tempt" Stirner's ancients.

"'For the ancients, the world was a truth,' says Feuerbach; but he forgets to make the important addition: a truth, the untruth of which they sought to penetrate and, finally, did indeed penetrate" (p. 22).

"For the ancients", *their* "world" (not *the* world) "was a truth" — whereby, of course, no truth about the ancient world is stated, but only that the ancients did not have a Christian attitude to their world. As soon as *untruth* penetrated their world (i.e., as soon as this world itself disintegrated in consequence of practical conflicts — and to demonstrate this materialistic development empirically would be the only thing of interest), the ancient philosophers sought to penetrate the world of truth or the truth of their world and then, of course, they found that it had become untrue. Their very search was itself a symptom of the internal collapse of this world. Jacques le bonhomme transforms the idealist symptom into the material cause of the collapse and, as a German church father, makes antiquity itself seek its own negation, Christianity. For him this position of antiquity is inevitable because the ancients are "*children*" who seek to penetrate the "world of things". "And that is fairly easy too": by transforming the ancient world into the later consciousness regarding the ancient world, Jacques le bonhomme can, of course, jump in a single leap from the materialistic ancient world to the world of religion, to Christianity. Now the "word of God" immediately emerges in opposition to the real world of antiquity; the Christian conceived as the modern sceptic emerges in opposition to the ancient man conceived as philosopher. His Christian "is never convinced of the vanity of the word of God" and, in consequence of this lack of conviction, he "believes" "in its eternal and invincible truth" (p. 22). Just as Stirner's ancient is ancient because he is a non-Christian, not yet a Christian or a hidden Christian, so his primitive Christian is a Christian because he is a non-atheist, not yet an atheist or a hidden atheist. Stirner, therefore, causes Christianity to be negated by the ancients and modern atheism by the primitive Christians, instead of the reverse. Jacques le bonhomme, like all other speculative philosophers, seizes everything by its philosophical tail. A few more examples of this child-like gullibility immediately follow.

"The Christian must consider himself a 'stranger on the earth' (Epistle to the Hebrews 11 :13)" (p. 23).

On the contrary, the strangers on earth (arising from extremely natural causes e.g., the colossal concentration of wealth in the whole Roman world, etc., etc.) had to consider themselves Christians. It was not their Christianity that made them vagrants, but their vagrancy that made them Christians. On the same page the holy father jumps straight from Sophocles' *Antigone* and the sacredness of the burial ceremonial connected with it to the Gospel of Matthew, 8:22 (let the dead bury their dead), while Hegel, at any rate in the *Phänomenologie*, gradually passes from the *Antigone*, etc., to the Romans. With equal right Saint Max could have passed at once. to the Middle Ages and, together with Hegel, have advanced this biblical statement against the Crusaders or even, in order to be quite original, have contrasted the burial of Polynices by Antigone with the transfer of the ashes of Napoleon from St. Helena to Paris. It is stated further:

"In Christianity the inviolable truth of family ties" (which on page 22 is noted as one of the "truths" of the ancients) "is depicted as an untruth which should be got rid of as quickly as possible (Mark, 10: 29) and so in everything" (p. 23).

This proposition, in which reality is again turned upside-down, should be put the right way up as follows: the actual untruth of family ties (concerning which, *inter alia*, the still existing documents of pre-Christian Roman legislation should be examined) is depicted in Christianity as an inviolable truth, "and so in everything".

From these examples, therefore, it is superabundantly evident how Jacques le bonhomme, who strives to "get rid as quickly as possible" of empirical history, stands facts on their heads, causes material history to be produced by ideal history, "and so in everything". At the outset we learn only the alleged attitude of the ancients to their world; as dogmatists they are put in opposition to the ancient world, their own world, instead of appearing as its creators; it is a question only of the relation of consciousness to the object, to truth; it is a question, therefore, only of the philosophical relation of the ancients to their world — ancient history is replaced by the history of ancient philosophy, and this only in the form in which Saint Max imagines it according to Hegel and Feuerbach.

Thus the history of Greece, from the time of Pericles inclusively, is reduced to a struggle of abstractions: reason, spirit, heart, worldliness, etc. These are the Greek parties. In this ghostly world, which is presented as the Greek world, allegorical persons such as Madame Purity of Heart "machinate" and mythical figures like Pilate (who must never be missing where there are children) find a place quite seriously side by side with Timon of Phlius.

After presenting us with some astounding revelations about the Sophists and Socrates, Saint Max immediately jumps to the Sceptics. He discovers that they completed the work which Socrates began. Hence the positive philosophy of the Greeks that followed immediately after the Sophists and Socrates, especially Aristotle's encyclopaedic learning, does not exist at all for Jacques le bonhomme. He strives "to get rid as quickly as possible" of the past and hurries to the transition to the "moderns", finding this transition in the Sceptics, Stoics and Epicureans. Let us see what our holy father has to reveal about them.

"The Stoics wish to realise the ideal of the wise man ... the man who knows how to live ... they find this ideal in contempt for the world, in a life without living development [...] without friendly intercourse with the world, i.e., in a life of isolation [...] not in a life in common with others; the Stoic alone lives, for him everything else is dead. The Epicureans, on the other hand, demand an active life" (p. 30).

We refer Jacques le bonhomme — the man who wants to realise himself and who knows how to live — to, *inter alia*, Diogenes Laertius: there he will discover that the wise man, the *sophos,* is nothing but the idealised Stoic, not the Stoic the realised wise man; he will discover that the *sophos* is by no means Only a Stoic but is met with just as much among the Epicureans, the Neo-academists and the Sceptics. Incidentally, the *sophos is* the first form in which the Greek *philosophos* confronts us; he appears mythologically in the seven wise men, in practice in Socrates, and as an ideal among the Stoics, Epicureans, Neo-academists [4] and Sceptics. Each of these schools, of course, has its own sofos [wise man] Just as Saint Bruno has his own "unique sex". Indeed, Saint Max can find "*le sage*" again in the eighteenth century in the philosophy of Enlightenment, and even in Jean Paul in the shape of the "wise men" like Emanuel [Jean Paul, Hesperus oder 45 Hundsposttage] etc. The Stoical wise man by no means has in mind "life without living development", but an *absolutely active* life, as is evident even from his concept of nature, which is Heraclitean, dynamic, developing and living, while for the Epicureans the principle of the concept of nature is the *mars immortalis* [immortal death. Lucretius, De rerum natura libri sex, Book 3, Verse 882], as Lucretius says, the atom, and, in opposition to Aristotle's divine energy, divine leisure is put forward as the ideal of life instead of "active life".

"The ethics of the Stoics (their only science, for they were unable to say anything about the spirit except what its relation to the world should be; and about nature — physics — they could say only that the wise man has to assert himself against it) is not a doctrine of the spirit, but merely a doctrine of rejection of the world and of self-assertion against the world" (p. 31).

The Stoics were able to "say about nature" that physics is one of the most important sciences for the philosopher and consequently they even went to the trouble of further developing the physics of Heraclitus; they were "further able to say" that the wra, masculine beauty, is the highest that the individual could represent, and glorified life in tune with nature, although they fell into contradictions in so doing. According to the Stoics, philosophy is divided into three doctrines: "physics, ethics, logic".

"They compare philosophy to the animal and to the egg, logic — to the bones and sinews of the animal, and to the. outer shell of the egg, ethics — to the flesh of the animal and to the albumen of the egg, and physics — to the soul of the animal and to the yolk of the egg" (Diogenes Laertius, Zeno).

From this alone it is evident how little true it is to say that "ethics is the only science of the Stoics". It should be added also that, apart from Aristotle, they were the chief founders of formal logic and systematics in general.

That the "Stoics were unable to say anything about the spirit" is so little true that even *seeing spirits* originated from them, on account of which Epicurus opposes them, as an Enlightener, and ridicules them as "old women", while precisely the Neo-Platonists borrowed part of their tales about spirits from the Stoics. This spirit-seeing of the Stoics arises, on the one hand, from the impossibility of achieving a dynamic concept of nature without the material furnished by empirical natural science, and, on the other hand, from their effort to interpret the ancient Greek world and even religion in a speculative manner and make them analogous to the thinking spirit.

The "ethics of the Stoics" is so much a "doctrine of world rejection and of self-assertion against the world" that, for example, it was counted a Stoical virtue to "have a sound fatherland, a worthy friend", that "the beautiful alone" is declared to be "the good", and that the Stoical wise man is allowed to mingle with the world in every way, for example, to commit incest, etc., etc. The Stoical wise man is to such an extent caught up "in a life of isolation and not in a life in common with others" that it is said of him in *Zeno*:

"Let not the wise man wonder at anything that seems wonderful — but nether will the worthy man live in solitude, for he is social by nature and active in practice" (Diogenes Laertius, Book VII, 1).

Incidentally, it would be asking too much to demand that, for the sake of refuting this school-boyish wisdom of Jacques le bonhomme, one should set forth the very complicated and contradictory ethics of the Stoics.

In connection with the Stoics, Jacques le bonhomme has to note the existence of the *Romans* also (p. 3 1), of whom, of course, he is unable to say anything, since they have no philosophy. The only thing we hear of them is that *Horace* (!) "did not go beyond the Stoics' worldly wisdom" (p. 32). *Integer vitae, scelerisque purus*! [he of life without flaw, pure from sin. Horace, The Odes, Book I — Ode XXII. Verse 1]

In connection with the Stoics, *Democritus* is also mentioned in the following way: a muddled passage of Diogenes Laertius (*Democritus*, Book IX, 7, 45), which in addition has been inaccurately translated, is copied out from some textbook, and made the basis for a lengthy diatribe about Democritus. This diatribe has the distinguishing feature of being in direct contradiction to its basis, i.e., to the above-mentioned muddled and inaccurately translated passage, and converts "peace of mind" (Stirner's translation of euqumia, in Low German *Wellmuth*) into "rejection of the world". The fact is that Stirner imagines that Democritus was a Stoic, and indeed of the sort that the unique and the ordinary school-boyish consciousness conceive a Stoic to be. Stirner thinks that "his whole activity amounts to an endeavour to detach himself from the world", "hence to a rejection of the world", and that in the person of Democritus he can refute the Stoics. That the eventful life of Democritus, who had wandered through the world a great deal, flagrantly contradicts this notion of Saint Max's; that the real source from which to learn about the philosophy of Democritus is Aristotle and not a couple of anecdotes from Diogenes Laertius; that Democritus, far from rejecting the world, was, on the contrary, an empirical natural scientist and the first encyclopaedic mind among the Greeks; that his almost unknown ethics was limited to a few remarks which he is *alleged* to have made when he was an old, much-travelled man; that his writings on natural science can be called philosophy only *per abusum*, [by abuse, i. e., improperly, wrongly] because for him, in contrast to Epicurus, the atom was only a physical hypothesis, an expedient for explaining facts, just as it is in the proportional combinations of modern chemistry (Dalton and others) — all this does not suit the purpose of Jacques le bonhomme. Democritus must be understood in the "unique" fashion, Democritus speaks of euthymia, hence of peace of mind, hence of withdrawal into oneself, hence of rejection of the world. Democritus is a Stoic, and he differs from the Indian fakir mumbling "Brahma" (the word should have been "Om"),[5] only as the comparative differs from the superlative, i.e., "only *in degree*".

Of the Epicureans our friend knows exactly as much as he does of the Stoics, viz., the unavoidable schoolboy's minimum. He contrasts the Epicurean "hedone", [pleasure] with the "ataraxia" [equanimity, imperturbability, intrepidity] of the Stoics and Sceptics, not knowing that this "ataraxia" is also to he found in Epicurus and, moreover, as something placed higher than the "hedone" — in consequence of which his whole contrast falls to the ground. He tells us that the Epicureans "teach *only a different attitude to the world*" from that of the Stoics; but let him show us the (non-Stoic) philosopher of "ancient or modern times" who does not do "only" the same. Finally, Saint Max enriches us with a new dictum of the Epicureans: "the world must be deceived, for it is my enemy". Hitherto it was only known that the Epicureans made statements in the sense that the world must be *disillusioned* and especially freed from fear of gods, for the world is my *friend*.

To give our saint some indication of the real base on which the philosophy of Epicurus rests, it is sufficient to mention that the idea that the state rests on the mutual agreement of people, on a *contrat social* (sunqhjh [contract]), is found for the first time in Epicurus.

The extent to which Saint Max's disclosures about the Sceptics follow the same line is already evident from the fact that he considers their philosophy more radical than that of Epicurus. The Sceptics reduced the theoretical relation of people to things to *appearance*, and in practice they left everything as of old, being guided by this appearance just as much as others are guided by actuality; they merely gave it another name. Epicurus, on the other hand, was the true radical Enlightener of antiquity; he openly attacked the ancient religion, and it was from him, too, that the atheism of the Romans, insofar as it existed, was derived. For this reason, too, Lucretius praised Epicurus as the hero who was the first to overthrow the gods and trample religion underfoot; for this reason among all church fathers, from Plutarch to Luther, Epicurus has always had the reputation of being the atheist philosopher *par excellence,* and was called a swine; for which reason, too, Clement of Alexandria says that when Paul takes up arms against philosophy he has in mind Epicurean philosophy alone. (*Stromatum*, Book I [chap. XI], p. 295, Cologne edition, 1688.) Hence we see how "cunning, perfidious" and "clever" was the attitude of this open atheist to the world in directly attacking its religion, while the Stoics adapted the ancient religion in their own speculative fashion, and the Sceptics used their concept of "appearance" as the excuse for being able to accompany all their judgments with a *reservatio mentalis.*

Thus, according to Stirner, the Stoics finally arrive at "contempt for the world" (p. 30), the Epicureans at ',the same worldly wisdom as the Stoics" (p. 32), and the Sceptics at the point where they "let the world alone and do not worry about it. at all". Hence, according to Stirner, all three end in an attitude of indifference to the world, of "contempt for the world" (p. 485). Long before him, Hegel expressed it in this way: Stoicism, Scepticism, Epicureanism "aimed at making the mind indifferent towards everything that actuality has to offer" *(Philosophie der Geschichte,* p. 327).

"The ancients," writes Saint max, summing up his criticism of the ancient world of ideas, "it is true, had ideas, but they did not know the idea" (p. 30). In this connection, "one should recall what was said earlier about our childhood ideas" (ibid.).

The history of ancient philosophy has to conform to Stirner's design. In order that the Greeks should retain their role of children, Aristotle ought not to have lived and his thought in and for itself (h nohsis h kaq authn), his self-thinking reason (auton de noeio nous) and his self-thinking intellect (h, nohsis ths nohsews) should never have occurred; and in general his *Metaphysics* and the third book of his *Psychology* [Aristoteles, De anima] ought not to have existed.

With just as much right as Saint Max here recalls "what was said earlier about our childhood", when he discussed "our childhood" he could have said: let the reader look up what will be *said* below about the ancients and the Negroes and will *not* be said about Aristotle.

In order to appreciate the true meaning of the last ancient philosophies during the dissolution of the ancient world, Jacques le bonhomme had only to look at the real situation in life of their adherents under the world dominion of Rome. He could have found, *inter alia*, in Lucian a detailed description of how the people regarded them as public buffoons, and how the Roman capitalists, proconsuls, etc., hired them as court jesters for their entertainment, so that after squabbling at the table with slaves for a few bones and a crust of bread and after being given a special sour wine, they would amuse the master of the house and his guests with delightful words like "ataraxia", "aphasia" [refusal to express any definite opinion] "hedone", etc.

Incidentally, if our good man wanted to make the history of ancient philosophy into a history of antiquity, then as a matter of course he ought to have merged the Stoics, Epicureans and Sceptics in the Neo-Platonists, whose philosophy is nothing but a fantastic combination of the Stoic, Epicurean and Sceptical doctrine with the content of the philosophy of Plato and Aristotle. Instead of that, he merges these doctrines directly in Christianity.

It is not "Stirner" that has left Greek philosophy "behind him", but Greek philosophy that has "Stirner" behind it (cf. *Wigand*, p. 186 [Max Stirner, "Recensenten Stirners"]). Instead of telling us *how* "antiquity" arrives at a world of things and "copes" with it,. this ignorant school-master causes antiquity blissfully to vanish by means of a quotation from Timon; whereby antiquity the more naturally "arrives at its final goal" since, according to Saint Max, the ancients "found themselves placed by *nature*" in the ancient "communality", which, "let us say in conclusion", "can be understood" the more easily because this communality, the family, etc., are dubbed "the so-called *natural* ties" (p. 33). By means of nature the ancient "world of things" is created, and by means of Timon and Pilate (p. 32) it is destroyed. Instead of describing the "world of things" which provides the material basis of Christianity, he causes this "world of things" to be annihilated in the world of the spirit, in Christianity.

The German philosophers are accustomed to counterpose antiquity, as the epoch of realism, to Christianity and modern times, as the epoch of idealism, whereas the French and English economists, historians and scientists are accustomed to regard antiquity as the period of idealism in contrast to the materialism and empiricism of modern times. In the same way antiquity can be considered to be idealistic insofar as in history the ancients represent the "*citoyen*", the idealist politician, while in the final analysis the moderns turn into the "bourgeois", the realist *ami du commerce* — or again it can be considered to be realistic, because for the ancients the communality was a "truth", whereas for the moderns it is an idealist "lie". All these abstract counterposings and historical constructions are of very little use.

The "unique thing" we learn from this whole portrayal of the ancients is that, whereas Stirner "knows" very few "things" about the ancient world, he has all the "better seen through" them (cf. *Wigand*, p. 191).

Stirner is truly that same "man child" of whom it is prophesied in the Revelation of St. John, 12:5, that he "was to rule all nations with a rod of iron". We have seen how he sets about the unfortunate heathen with the iron rod of his ignorance. The "moderns" will fare no better.

4. The Moderns

"Therefore if any man be in Christ, he is a new creature: old things are passed away; behold, all things are become new" (2 Corinthians 5:17) (p. 33).

By means of this biblical saying the ancient world has now indeed passed away" or, as Saint Max really wanted to say, "all gone", and with one leap [Satz, = leap, jump and also sentence or proposition] we have jumped over to the new, Christian, youthful, Mongoloid "world of the spirit". We shall see that this, too, will have "all gone" in a very short space of time.

"Whereas it was stated above 'for the ancients, the world was a truth', we must say here 'for the moderns the spirit was a truth', but in neither case should we forget the important addition: 'a truth, the untruth of which they sought to penetrate and, finally, did indeed penetrate'" (p. 33).

While we do not wish to devise any Stirner-like constructions, "we must say here": for the moderns truth was a spirit, namely the holy spirit. Jacques le bonhomme again takes the moderns not in their actual historical connection with the "world of things" — which, despite being "all gone", nevertheless continues to exist — but in their theoretical, and indeed religious, attitude. For him the history of the Middle Ages and modern times again exists only as the history of religion and philosophy; he devoutly believes all the illusions of these epochs and the philosophical illusions about these illusions. Thus, having given the history of the moderns the same turn as he gave that of the ancients, Saint Max can then easily "demonstrate" in it a 'similar course to that taken by antiquity", and pass from the Christian religion to modern German philosophy as rapidly as he passed from ancient philosophy to the Christian religion. On page 37 he himself gives a characterisation of his historical illusions, by making the discovery that "the ancients have nothing to offer but *worldly wisdom*" and that "the moderns have never gone, and do not go, beyond *theology*", and he solemnly asks: "What did the *moderns* seek to penetrate?" The ancients and moderns alike do nothing else in history but "seek to penetrate something" — the ancients try to find out what is behind the world of things, the moderns behind the world of the spirit. In the end ' the ancients are left "without a world" and the moderns "without a spirit"; the ancients wanted to become idealists, the moderns to become realists (p. 485), but both of them were only occupied with the divine (p. 488) — "history up to now" is only the "history of the spiritual man" (what faith!) (p. 442) — in short we have again. the child and the youth, the Negro and the Mongol, and all the rest of the terminology of the "various transformations". At the same time we see a faithful imitation of the speculative manner, by which children beget their father, and what is earlier is brought about by what is later. From the very outset Christians must "seek to penetrate the untruthfulness of their truth", they must immediately be hidden atheists and critics, as was already indicated concerning the ancients. But not satisfied with this, Saint Max gives one more brilliant example of his "virtuosity in" (speculative) "thought" (p. 230):

"Now, after liberalism has acclaimed man, one can state that thereby only the last consequence of Christianity has been drawn and that Christianity originally set itself no other task than that of ... realising man."

Since allegedly the last consequence of Christianity has been drawn, "*one*" can state that it has been drawn. As soon as the later ones have transformed what was earlier "*one* can state" that the earlier ones "originally", namely "*in truth*", in essence, in heaven, as hidden Jews, "set themselves no other task" than that of being transformed by the later ones. *Christianity*, for Jacques le bonhomme, is a self-positing subject, the absolute spirit, which "originally" posits its end as its beginning. Cf. Hegel's *Encyclopädie,* etc.

"Hence" (namely because one can attribute an imaginary task to Christianity) "there follows the delusion" (of course, before Feuerbach it was impossible to know what task Christianity "had originally set itself") "that Christianity attaches infinite value to the ego, as revealed, for example, in the theory of immortality and pastoral work. No, it attaches this value to man alone, man alone is immortal, and only because I am a man, am I also immortal."

if, then, from the whole of Stirner's scheme and formulation of tasks it emerges, already sufficiently clearly, that Christian' try can lend immortality only to Feuerbach's "man", we learn here in addition that this comes about also because Christianity does not ascribe this immortality — to *animals* as well.

Let us now also draw up a scheme *à la* Saint Max.

"*Now, after*" modern large-scale landownership, which has arisen from the process of parcellation, has actually "*proclaimed*" primogeniture, "*one can state that thereby only the last consequence*" of the parcellation of landed property "*has been drawn*" " *and that*" parcellation "*in truth originally set itself no other task than that of realising*" primogeniture, true primogeniture. "*Hence there follows the delusion*" that parcellation "*attaches infinite value*" to equal rights of members of the family, "*as revealed, for example*", in the laws of inheritance of the *Code Napoléon. "No, it attaches this value solely*" to the eldest son; "*only*" the eldest son, the future owner of the entailed estate, will become a large landowner, "*and only because I am*" the eldest son "*I will also be*" a large landowner.

In this way it is infinitely easy to give history "unique" turns, as one has only to describe its very latest result as the "task" which "in truth originally it set itself". Thereby earlier times acquire a bizarre and hitherto unprecedented appearance. It produces a striking impression, and does not require great production costs. As, for instance, if one says that the real "task" which the institution of landed property "originally set itself" was to replace people by. sheep — a consequence which has recently, become manifest in Scotland, etc., or that the proclamation of the Capet dynasty [6] "originally in truth set itself the task" of sending Louis XVI to the guillotine and M. Guizot into the Government. The important thing is to do it in a solemn, pious, priestly way, to draw a deep breath, and then suddenly to burst out: "Now, at last, *one* can state it."

What Saint Max says about the moderns in the above section (pp. 33-37) is only the prologue to the spirit history which is in store

for us. Here, too, we see how he tries "to rid himself as quickly as possible" of empirical facts and parades before us the same categories as in the case of the ancients — *reason, heart*, spirit, etc. — only they are given different names. The Sophists become sophistical scholastics, "humanists, Machiavellism (the art of printing, the New World", etc.; cf. Hegel's *Geschichte der Philosophie,* III, p. 128) who represent reason; Socrates is transformed into Luther, who extols the heart (Hegel, 1.c., p. 227), and of the post-Reformation period we learn that during that time it was a matter of "empty cordiality" (which in the section about the ancients was called "purity of heart", cf. Hegel, 1.c., p. 241). All this on page 34. In this way Saint Max "proves" that "Christianity takes a course "similar to that of antiquity". After Luther he no longer even troubles to provide names for his categories; he hurries in seven-league boots to modern German philosophy. Four oppositions ("until nothing remains but empty cordiality, all the universal love of mankind, love of man, consciousness of freedom, 'self-consciousness"', p. 34; Hegel, 1.c., pp. 228, 229), four words fill the gulf between Luther and Hegel and "only thus is Christianity completed". This whole argument is achieved in one masterly sentence, with the help of such levers as "at last"-"and from that time" — "since *one*" — "also" — "from day to day" — "until finally", etc., a sentence which the reader can verify for himself on the classic page 34 already mentioned.

Finally Saint Max gives us a few more examples of his faith, showing that he is so little ashamed of the Gospel that he asserts: "We really are nothing but spirit", and maintains that at the end of the ancient world "after long efforts" the "spirit" has really "rid itself of the world". And immediately afterwards he once more betrays the secret of his scheme, by declaring of the Christian spirit that "*like a youth* it entertains plans for improving or saving the world". All this on page 36.

"So he carried me away in the spirit into the wilderness: and I saw a woman sit upon a scarlet-coloured beast, full of names of blasphemy.... And upon her forehead was a name written, Mystery, Babylon the Great ... and saw the woman drunken with the blood of the saints", etc. (Revelation of St. John, 17, Verses 3, 5, 6).

The apocalyptic prophet did not prophesy accurately this time. Now at last, after Stirner has acclaimed *man*, one can state that he ought to have said: So he carried me into the wilderness of the spirit. And I saw a man sit upon a scarlet-coloured beast, full of blasphemy of names ... and upon his forehead was a name written, Mystery, the unique ... and I saw the man drunken with the blood of holy, etc. So we now enter the wilderness of the spirit.

A. The Spirit (Pure History of Spirits)

The first thing we learn about the "spirit" is that it is not the spirit but "the *realm* of spirits" that "is immensely large". Saint Max has nothing to say immediately of the spirit except that "an immensely large realm of spirits" exists — just as all he knows of the Middle Ages is that this period lasted for "a long time". Having presupposed that this "realm of spirits" exists, he subsequently proves its existence with the help of ten theses.

1. The spirit is not a free spirit until it is not occupied with itself alone, until it is not „solely concerned" with its own world, the "spiritual" world (first with itself alone and then with its own world).

2. "It is a free spirit only in a world of its own."

3. "Only by means of a spiritual world is the spirit really spirit."

4. "Before the spirit has created its world of spirits, it is not spirit."

5. "Its creations make it spirit." ...

6. "Its creations are its world." ...

7. "The spirit is the creator of a spiritual world." ...

8. "The spirit exists only when it creates the spiritual." ...

9. "Only together with the spiritual, which is its creation, is it real." ...

10. "But the works or offspring of the spirit are nothing but — spirits" (pp. 38-39).

In thesis 1 the "spiritual world" is again immediately presupposed as existing, instead of being deduced, and this thesis 1 is again preached to us in theses 2-9 in eight new transformations. At the end of thesis 9 we find ourselves exactly where we were at the end of thesis 1 — and then in thesis 10 a "*but*" suddenly introduces us to "*spirits*", about whom so far nothing has been said.

"Since the spirit exists only by creating the spiritual, we look around for its first creations" (p. 41),

According to theses 3, 4, 5, 8, and 9, however, the spirit is its own creation. This is now expressed thus, the spirit, i.e., the first creation of the spirit,

"must arise out of nothing it must first create itself its first creation is itself, the spirit" (ibid,). "When it has accomplished this creative act there follows from then on a natural reproduction of creations just as, according to the myth, only the first human beings had to be created and the rest of the human race was reproduced of itself" (ibid.).

“However mystical this may sound, we nevertheless experience this daily. Are you a thinking person before you think? In creating your first thought, you can create yourself, the thinker for you do not think until you think, — i.e. — have some thought. Is it not your singing alone that makes you a singer, your speech that makes you a speaking person? Well, in the same way only the creation of the spiritual makes you spirit.”

Our saintly conjurer assumes that the spirit creates the spiritual in order to draw the conclusion that the spirit creates itself as spirit; on the other hand, he assumes it *as spirit* in order to allow it to arrive at its spiritual creations (which, “according to the myth, are reproduced of themselves” and become spirits). So far we have the long-familiar orthodox-Hegelian phrases. The genuinely “unique” exposition of what Saint Max wants to say only begins with the example he gives. That is to say, if Jacques le bonhomme cannot get any further, if even “One” and “it” are unable to float his stranded ship, “Stirner” calls his third serf to his assistance, the “You”, who never leaves him in the lurch and on whom he can rely in extremity. This “You” is an individual whom we are not encountering for the first time, a pious and faithful servant, [Matthew 25:21] whom we have seen going through fire and water, a worker in the vineyard of his lord, a man who does not allow anything to terrify him, in a word he is: *Szeliga*. [cf. Die Heilige Familie, oder Kritik der kritischen Kritik, where the earlier exploits of this man of God have already been set forth.] When “Stirner” is in the utmost plight in his exposition he cries out: Szeliga, help! — and trusty Eckart Szeliga immediately puts his shoulder to the wheel to get the cart out of the mire. We shall have more to say later about Saint Max’s relation to Szeliga.

It is a question of spirit which creates *itself* out of *nothing*, hence it is a question of *nothing*, which *out of nothing* makes itself spirit. From this Saint Max derives the creation of Szeliga’s spirit from Szeliga. And who else if not Szeliga could “Stirner” count on allowing himself to be put in the place of nothing in the manner indicated above? Who could be taken in by such a trick but Szeliga, who feels highly flattered at being allowed to appear at all as one of the *dramatis personae*? What Saint Max had to prove was not that a given “you”, i.e., the given Szeliga, becomes a thinker, speaker, singer from the moment when he begins to think, speak, sing — but that the *thinker* creates *himself out of nothing* by beginning to think, that the singer creates *himself out of nothing* by beginning to sing, etc., and it is not even the thinker and the singer, but the *thought* and the *singing* as subjects that create *themselves out of nothing* by beginning to think and to sing. For the rest, “Stirner makes only the extremely simple reflection” and states only the “extremely popular” proposition (cf. *Wigand*, p. 156) that Szeliga develops one of his qualities by developing it. There is, of course, absolutely nothing “to be wondered at” in the fact that Saint Max does not even “make” correctly “such simple reflections”, but expresses them incorrectly in order thereby to prove a still much more incorrect proposition with the aid of the most incorrect logic in the world.

Far from it being true that “out of nothing” I make myself, for example, a “speaker”, the nothing which forms the basis here is a very manifold something, the real individual, his speech organs, a definite stage of physical development, an existing language and dialects, ears capable of hearing and a human environment from which it is possible to hear something, etc., etc. Therefore, in the development of a property something is created by something out of something, and by no means comes, as in Hegel’s *Logik*, from nothing, through nothing to nothing. [cf. G.W.F. Hegel. Wissenschaft der Logik, Th. I, Abt. 2]

Now that Saint Max has his faithful Szeliga close at hand, everything goes forward smoothly again. We shall see how, by means of hi ‘ S “You”, he again transforms the spirit into the youth, exactly as he earlier transformed the youth into the spirit; here we shall again find the whole history of the youth repeated almost word for word, only with a few camouflaging alterations — just as the “Immensely large realm of spirits” mentioned on page 37 was nothing but the “realm of the spirit”, to found and enlarge which was the “aim” of the spirit of the youth (p. 17).

“Just as you, however, distinguish yourself from the thinker, singer, speaker, so you distinguish yourself no less from the spirit and are well aware that You are something else as well as spirit. However, just as in the enthusiasm of thinking it may easily happen that sight and hearing fail the thinking ego, so the enthusiasm of the spirit has seized you too, and you too, and you now aspire with all four might to become wholly spirit and merged in spirit. The spirit is your ideal, something unattained, something of the beyond: spirit: means your — God, — God is spirit [John 4:24] ... You inveigh against yourself, you who cannot get rid of ‘a relic of the non-spiritual. Instead of saving: I am more than spirit, you say contritely: I am less than spirit, and I can only envisage spirit, pure spirit, or the spirit which is nothing but spirit, but I am not it, and since I am not it, then it is an other, it exists as an other, whom I call ‘God’.”

After previously, for a long time occupying ourselves with the trick of making something out of nothing, we now suddenly, perfectly naturally”, come to an individual who is something else as well as spirit, consequently is something, and wants to become pure spirit, i.e., nothing. This much easier problem, i.e., to turn something into nothing, once again poses the whole story of the youth, who “has yet to seek the perfect spirit”, and one needs merely to repeat the old phrases from pages 17-18 to be extricated from all difficulties. Particularly, when one has such an obedient and gullible servant as Szeliga, on whom “Stirner” can impose the idea that *just as* “in the enthusiasm of thinking it may *easily*” (!) “happen that sight and hearing fail" him, "Stirner", *so* he, Szeliga, has also been "seized with the enthusiasm of the spirit" and he, Szeliga, "is now aspiring with all his might to *become* spirit", instead of acquiring spirit, that is to say, he now has to play the role of the youth as presented on page 18. Szeliga believes it and in fear and trembling he obeys; he obeys when Saint Max thunders at him: The spirit is your ideal — your God. You do this for me, you do that for me. Now you "inveigh", now "you say" now "you *can* envisage", etc. When "Stirner" imposes on him the idea that "the pure spirit is an other, for he" (Szeliga) "is not it", then in truth, it is only Szeliga who is capable of believing him and who gabbles the entire nonsense after him, word for word. Incidentally, the method by which Jacques le bonhomme makes up this nonsense was already exhaustively analysed when dealing with the youth. Since you are well aware that you are something else as well as a mathematician, you aspire to become wholly a mathematician, to become merged in mathematics, the mathematician is your ideal, mathematician means your — God. You say contritely: I am less than a mathematician and I can only envisage the mathematician, and since I am not him, then he is an other, he exists as an other, whom I call "God". Someone else in Szeliga's place would say — Arago.

"Now, at last, after" we have proved Stirner's thesis to be a repetition of the "youth", "one can state" that he "in truth originally set himself no other task" than to identify the spirit of Christian asceticism with spirit in general, and to identify the frivolous esprit, for example, of the eighteenth century with Christian spiritlessness.

It follows, therefore, that the necessity of spirit dwelling in the beyond, i.e., being God, is not to be explained, as Stirner asserts, "because ego and spirit are different names for different things, because ego is not spirit and spirit is not ego" (p. 42). The explanation lies in the "enthusiasm of the spirit" which is ascribed without any grounds to Szeliga and which makes him an ascetic, i.e., a man who wishes to become God (pure spirit), and because he is not able to do this posits God outside himself. But it was a matter of the spirit having first to create *itself* out of nothing and then having to create *spirits* out of itself. Instead of this, Szeliga now produces God (the unique spirit that makes its appearance here) not because he, Szeliga, is the *spirit*, but because he is Szeliga, i.e., imperfect spirit, unspiritual spirit, and therefore at the same time non-spirit. But Saint Max does not say a word about how the Christian conception of spirit as God arises, although this is now no longer such a clever feat; he assumes the existence of this conception in order to explain it.

The history of the creation of the spirit "has in truth originally set itself no other task" than to put Stirner's stomach among the stars.

1. "Precisely because we are not the spirit which dwells within us, for that very reason we had to ...	***2. Precisely because we are not stomach which dwells within us, for that the very reason we had to ...***

that put it outside of ourselves; it was not us, and therefore we could not conceive it as existing except outside of ourselves, beyond us, in the beyond" (p, 43).

It was a matter of the spirit having first to create itself and then having to create something other than itself out of itself; the question was: What is this something else? No answer is given to this question, but after the above-mentioned "various transformations" and twists, it becomes distorted into the following new question:

"The spirit is something other than the ego. But what is this something other?" (p. 45).

Now, therefore, the question arises: What is the spirit other than the ego? whereas the original question was: What is the spirit, owing to its creation out of nothing, other than itself? With this Saint Max jumps to the next "transformation".

B. The Possessed (Impure History of Spirits)

Without realising it, Saint Max has so far done no more than give instruction in the art of spirit-seeing, by regarding the ancient and modern world only as the "pseudo-body of a spirit", as a spectral phenomenon, and seeing in it only struggles of spirits. Now, however, he consciously and *ex professo* gives instruction in the art of ghost-seeing.,

Instructions in the art of seeing spirits. First of all one must become transformed into a complete fool, i.e., imagine oneself to be Szeliga, and then say to oneself, as Saint Max does to this Szeliga: "Look around you in the world and say for yourself whether a spirit is not looking at you from everywhere!" If one can bring oneself to imagine this, then the spirits will come "easily", of themselves; in a "flower" one sees only the "creator", in the mountains — a "spirit of loftiness", in water — a "spirit of longing" or the longing of the spirit, and one hears "millions of spirits speak through the mouths of people". If one has achieved this level, if one can exclaim with Stirner: " Yes, ghosts are teeming in the whole world," then "it is not difficult to advance to the point" (p. 93) where one makes the further exclamation: "Only *in* it? *No,* the world itself is an apparition" (let your communication be, Yea, yea; Nay, nay: for whatsoever is more than these cometh of evil [Matthew 5: 37] i.e., a logical transition), "it is the wandering pseudo-body of a spirit, it is an apparition." Then cheerfully "look near at hand or into the distance, you are surrounded by a ghostly world.... You see spirits". If you are an ordinary person you can be satisfied with that, but if you are thinking of ranking yourself with Szeliga, then you can also look into yourself and then "you should not be surprised" if, in these circumstances and from the heights of Szeligality, you discover also that "your spirit is a ghost haunting your body", that you yourself are a ghost which "awaits salvation, that is, a spirit". Thereby you will have arrived at the point where you are capable of seeing "spirits" and "ghosts" in "all" people, and therewith spirit-seeing "reaches its final goal" (pp. 46, 47).

The basis of this instruction, only much more correctly expressed, Is to be found in Hegel, *inter alia*, in the *Geschichte der Philosophie,* III, pp. 124, 125.

Saint Max has such faith in his own instruction that as a result he himself becomes Szeliga and asserts that

"ever since the word was made flesh [John 1:14], the world is spiritualised, bewitched, a ghost" (p. 47).

"Stirner" "sees spirits".

Saint Max intends to give us a phenomenology of the Christian spirit and in his usual way seizes on only one aspect. For the Christian the world was not only *spiritualised* but equally *de*spiritualised as, for example, Hegel quite correctly admits in the passage mentioned, where he brings the two aspects into relation with each other, which Saint Max should also have done if he wanted to proceed historically. As against the world's despiritualisation in the Christian consciousness, the ancients, "who saw gods everywhere", can with equal justification be regarded as the spiritualisers of the world — a conception which our saintly dialectician rejects with the well-meaning warning: "Gods, my dear modern man, are not spirits" (p. 47). Pious Max recognises only the *holy* spirit as spirit.

But even if he had given us this phenomenology (which after Hegel is moreover superfluous), he would all the same have given us nothing. The standpoint at which people are content with such tales about spirits is itself a religious one, because for people who adopt it religion is a satisfactory answer, they regard religion as *causa sui* [its own cause] (for both "self-consciousness" and "man" are still religious) instead of explaining it from the empirical conditions and showing how definite relations of industry and intercourse are necessarily connected with a definite form of society, hence, with a definite form of state and hence with a definite form of religious consciousness. If Stirner had looked at the real history of the Middle Ages, he could have found why the Christian's notion of the world took precisely this form in the Middle Ages, and how it happened that it subsequently passed into a different one; he could have found that "*Christianity*" *has no history whatever* and that all the different forms in which it was visualised at various times were not "self-determinations" and "further developments" "of the religious spirit", but were brought about by wholly empirical causes in no way dependent on any influence of the religious spirit.

Since Stirner "does not stick to the rules" (p. 45), it is possible, before dealing in more detail with spirit-seeing, to say here and now that the various "transformations" of Stirner's people and their world consist merely in the transformation of the entire history of the world into the body of Hegel's philosophy; into ghosts, which only apparently are an "other being" of the thoughts of the Berlin professor. In the *Phänomenologie*, the Hegelian bible, "the book", individuals are first of all transformed into "consciousness" [and the] world into "object", whereby the manifold variety of forms of life and history is reduced to a different attitude of "consciousness" to the "object". This different attitude is reduced, in turn, to three cardinal relations: 1) the relation of consciousness to the object as to truth, or to truth as mere object (for example, sensual consciousness, natural religion, Ionic philosophy, Catholicism, the authoritarian state, etc.); 2) the relation of consciousness as *the true* to the object (reason, spiritual religion, Socrates, Protestantism, the French Revolution); 3) the true relation of consciousness to truth as object, or to the object as truth (logical thinking, speculative philosophy, the spirit as existing for the spirit). In Hegel, too, the first relation is defined as God the Father, the second as Christ, the third as the Holy Spirit, etc. Stirner already used these transformations when speaking of child and youth, of ancient and modern, and he repeats them later in regard to Catholicism and Protestantism, the Negro and the Mongol, etc., and then accepts this series of camouflages of a thought in all good faith as the world against which he has to assert and maintain himself as a "corporeal individual".

Second set of instructions in spirit-seeing. How to transform the world into the spectre of truth, and oneself into something made holy or spectral. A conversation between Saint Max and his servant Szeliga (pp. 47, 48).

Saint Max: "You have spirit, for you have thoughts. What are your thoughts?"

Szeliga: "Spiritual entities."

Saint Max: "Hence they are not things?"

Szeliga: "No, but they 'are the spirit of things, the important element in all things, their innermost essence, their idea."

Saint Max: "What you think is, therefore, not merely your thought?"

Szeliga: "On the contrary, it is the most real, genuinely true thing in the world: it is truth itself; when I but truly think, I think the truth. I can admittedly he mistaken about the truth and fail to perceive it, but when I truly perceive, then the object of my perception is the truth."

Saint Max: "Thus, you endeavour all the time to perceive the truth?"

Szeliga: "For me the truth is sacred.... The truth I cannot abolish; in the truth I believe, and therefore I investigate into its nature; there is nothing higher than it, it is eternal. The truth is sacred, eternal, it is the holy, the eternal."

Saint Max (indignantly): "But you, by allowing yourself to become filled with this holiness, become yourself holy."

Thus, when Szeliga truly perceives some object, the object ceases to be an object and becomes "the truth". This is the first manufacture of spectres on a large scale. — It is now no longer a matter of perceiving objects, but of perceiving the truth; first he perceives objects truly, which he defines as the truth of perception, and he transforms this into perception of the truth. But after Szeliga has thus allowed truth as a spectre to be imposed on him by the threatening saint, his stern master strikes home with a question of conscience, whether he is filled "all the time" with longing for the truth, whereupon the thoroughly confused Szeliga blurts out somewhat prematurely: "For me the truth is sacred." But he immediately notices his error and tries to correct it, by shamefacedly transforming objects no longer into the truth, but into a number of truths, and abstracting "the truth" as the truth of these truths, "the truth" which he can now no longer abolish after he has *distinguished* it from truths which are capable of being abolished. Thereby it becomes "eternal". But not satisfied with giving it predicates such as "sacred, eternal", he transforms it into the holy, the eternal, as subject. After this, of course, Saint Max can explain to him that having become "filled" with this holiness, he "himself becomes holy" and "should not be surprised" if he now "finds nothing but a spectre" in himself. Then our saint begins a sermon:

"The holy, moreover, is not for your senses" and quite consistently appends by means of the conjunction "and": "never will you, as a sensuous being, discover its traces"; that is to say, after sensuous objects are "all gone" and "the truth", "the sacred truth", "the holy" has taken their place, "But" — obviously, — "for your faith or more exactly for your spirit" (for your lack of spirit), "for it is itself something spiritual" (per appositionen), "a spirit" (again per appos.), "is spirit for the spirit".

Such is the art of transforming the ordinary world, "objects", by means of an arithmetical series of *appositions*, into "spirit for the spirit". Here we can only admire this dialectical method of appositions — later we shall have occasion to explore it and present it in all its classical beauty.

The method of oppositions can also be reversed — for example here, after we have once produced "the holy", it does not receive further oppositions, but is made the apposition of a new definition; this is combining progression with equation. Thus, as a result of some dialectical process "there remains the idea of another entity" which "I should serve more than myself" (*per appos.*), which for me should be more important than everything else" *(per appos.*), "in short — a something *in which I should seek my true salvation*" (and finally *per appos.* the return to the first series), and which becomes "something 'holy'" (p. 48). We have here two progressions which are equated to each other and can thus provide the opportunity for great variety of equations. We shall deal with this later. By this method too, "the sacred", which hitherto we have been acquainted with only as a purely theoretical designation of purely theoretical relations, has acquired a new practical meaning as "something in which I should seek my true salvation", which makes it possible to make the holy the opposite of the egoist. Incidentally we need hardly mention that this entire dialogue with the sermon that follows is nothing but another repetition of the story of the youth already met with three or four times before.

Here, having arrived at the "egoist", we need not stick to Stirner's "rules" either, because, firstly, we have to present his argument in all its purity, free from any intervening intermezzos, and, secondly, because in any case these intermezzi (on the analogy of "a Lazaroni" — *Wigand*, p. 159, the word should be Lazzarone — Sancho would say intermezzi's) will occur again in other parts of the book, for Stirner, far from obeying his own requirement "always to draw back into himself", on the contrary expresses himself again and again. We shall only just mention that the question raised on page 45: What is this something distinct from the "ego" that is the spirit? is now answered to the effect that it is the holy, i.e., that which is foreign to the "ego", and that everything that is foreign to the "ego" is — thanks to some unstated appositions, appositions "in themselves" — accordingly without more ado regarded as spirit. Spirit, the holy, the foreign are identical ideas, on which he declares war, in the same way almost word for word as he did at the very outset in regard to the youth and the man. We have, therefore, still not advanced a step further than we had on page 20.

a) The Apparition

Saint Max now begins to deal seriously with the "spirits" that are "offspring of the spirit" (p. 39), with the ghastliness of everything (p. 47). At any rate, he imagines so. Actually, however, he only substitutes a new name for his former conception of history according to which people were from the outset the representatives of general concepts. These general concepts appear here first of all in the Negroid form as objective spirits having for people the character of objects, and at this level are called spectres or — *apparitions*. The chief spectre is, of course, "man" himself, because, according to what has been previously said, people only exist for one another as representatives of a universal — essence, concept, the holy, the foreign, a the spirit — i.e., only as spectral persons, spectres, and because, according to Hegel's *Phänomenologie,* page 25 and elsewhere, the spirit, insofar as for man it has the "form of thinghood", is another man (see below about "the *man*").

Thus, we see here the skies opening and the various kinds of spectres passing before us one after the other. Jacques le bonhomme forgets only that he has already caused ancient and modern times to parade before us like gigantic spectres, compared with which all the harmless fancies about God, etc., are sheer trifles.

Spectre No. 1: the *supreme being,* God (p. 53). As was to be expected from what has preceded, Jacques le bonhomme, whose faith moves all the mountains' of world history, believes that "for thousands of years people have set themselves the *task*", "have tired themselves out struggling with the awful impossibility, the endless Danaidean labour" — "to prove the existence of God". We need not waste any more words on this incredible belief.

Spectre No. 2: *essence.* What our good man says about essence is limited — apart from what has been copied out of Hegel — to "pompous words and miserable thoughts" (p. 53). "The advance from" essence "to" world essence "is not difficult", and this world essence is, of course, Spectre No. 3: the *vanity of the world.* There is nothing to say about this except that from it "easily" arises

Spectre No. 4: *good and evil beings.* Something, indeed, could be said about this but is not said — and one passes at once to the next:

Spectre No. 5: the *essence and its realm.* We should not be at all surprised that we find here essence for the second time in our honest author, for he is fully aware of his "clumsiness" (*Wigand*, p. 166), and therefore repeats everything several times in order not to be misunderstood. Essence is here in the first place defined as the proprietor of a "realm" and then it is said of it that it is "essence" (p. 54), after which it is swiftly transformed into

Spectre No. 6: "*essences*". To perceive and to recognise them, and them alone, is religion. "Their realm" (of essences) "is — a realm of essences" (p. 54). Here there suddenly appears for no apparent reason

Spectre No. 7: the *God-Man*, Christ. Of him Stirner is able to say that he was "*corpulent*". If Saint Max does not believe in Christ, he at least believes in his "actual corpus". According to Stirner, Christ introduced great distress into history, and our sentimental saint relates with tears in his eyes "how the strongest Christians have racked their brains in order to comprehend him" — indeed,

"there has never been a spectre that caused such mental anguish, and no shaman, spurring himself into wild frenzy and nerve-racking convulsions, can have suffered such agony as Christians have suffered on account of this most incomprehensible spectre".

Saint Max sheds a sympathetic tear at the grave of the victims of Christ and then passes on to the "horrible being",

Spectre No. 8, *man.* Here our hold writer is seized with immediate "horror" — "he is terrified of himself", he sees in every man a "frightful spectre", a "sinister spectre" in which something "stalks" (pp. 55, 56). He feels highly uncomfortable. The split between phenomenon and essence gives him no peace. He is like Nabal, Abigail's husband, of whom it is written that his essence too was separated from his phenomenal appearance: "And there was a man in Maon, *whose possessions* [wesen (essence) — in Luther's Bible Wesen means "possession"] *were in Carmel*". (1 Samuel 25: 2.) But in the nick of time, before the "mental anguish" causes Saint Max in desperation to put a bullet through his head, he suddenly remembers the ancients who "took no notice of anything of the kind in their slaves". This leads him to

Spectre No. 9, *the national spirit* (p. 56), about which too Saint Max, who can no longer be restrained, indulges in "frightful" fantasies, in order to transform

Spectre No. 10, "*everything*", into an apparition and, finally, where all enumeration ends, to hurl together in the class of spectres the "holy spirit", truth, justice, law, the good cause (which he still cannot forget) and half a dozen other things completely foreign to one another.

Apart from this there is nothing remarkable in the whole chapter except that Saint Max's faith moves an historical mountain. That is to say, he utters the opinion (p. 56):

"Only for the sake of a supreme being has anyone ever been worshipped, only as a spectre has he been regarded as a sanctified, i.e." (that is!) "protected and recognised person."

If we shift this mountain, moved by faith alone, back into its proper place, then "it will read": Only for the sake of persons who are protected, i.e., who protect themselves, and who are privileged, i.e., who seize privileges for themselves, have supreme beings been worshipped and spectres sanctified. Saint Max imagines, for example, that in antiquity, when each people was held together by material relations and interests, e.g., by the hostility of the various tribes, etc., when owing to a shortage of productive forces each had either to be a slave or to possess slaves, etc., etc., when, therefore, belonging to a particular people was a matter of "the most natural interest" (*Wigand*, p. [162]) — that then it was only the concept people, or "nationality" that gave birth to these interests from itself; he imagines also that in modern times, when free competition and world trade gave birth to hypocritical, bourgeois cosmopolitanism and the notion of man — that here, on the contrary, the later philosophical construction of man brought about those relations as its "revelations" (p. 51). It is the same with religion, with the realm of essences, which he considers the unique realm, but concerning the essence of which he knows nothing, for otherwise he must have known that religion *as such* has neither essence, nor realm.

— On Religion —

In religion people make their empirical world into an entity that is only conceived, imagined, that confronts them as something foreign. This again is by no means to be explained from other concepts, from "self-consciousness" and similar nonsense, but from the entire hitherto existing mode of production and intercourse, which is just as independent of the pure concept as the invention of the *self-acting mule* and the use of railways are independent of Hegelian philosophy. If he wants to speak of an "essence" of religion, i.e., of a material basis of this inessentiality, then he should look for it neither in the "essence of man", nor in the predicates of God, but in the material world which each stage of religious development finds in existence (cf. above *Feuerbach*).

All the "spectres" which have filed before us were concepts. These concepts — leaving aside their real basis (which Stirner in any case leaves aside) — understood as concepts inside consciousness, as thoughts in people's heads, transferred from their objectivity back into the subject, elevated from substance into self-consciousness, are — *whimsies* or *fixed ideas.*

Concerning the origin of Saint Max's history of ghosts, see Feuerbach in *Anekdota* II, p. 66 [Ludwig Feuerbach, "Verläufige Thesen zur Reformation der Philosophie"], where it is stated:

"Theology is belief in ghosts. Ordinary theology, however, has its ghosts in the sensuous imagination, speculative theology has them in non-sensuous abstraction."

And since Saint Max shares the belief of all critical speculative philosophers of modern times that thoughts, which have become independent, objectified thoughts — ghosts — have ruled the world and continue to rule it, and that all history up to now was the history of theology, nothing could be easier for him than to transform history into a history of ghosts. Sancho's history of ghosts, therefore, rests on the traditional belief in ghosts of the speculative philosophers.

b) Whimsy

"Man, there are spectres in your head!... You have a fixed idea!" thunders Saint Max at his slave Szeliga. "Don't think I am joking," he threatens him. Don't dare to think that the solemn "Max Stirner" is capable of joking.

The man of God is again in need of his faithful Szeliga in order to pass from the object to the subject, from the apparition to the whimsy.

Whimsy is the hierarchy in the single individual, the domination of thought "in him over him". After the world has confronted the fantasy-making youth (of page 20) as a world of his "feverish fantasies", as a world of ghosts, "the off-springs of his own head" inside his head begin to dominate him. The world of his feverish fantasies — this is the step forward he has made' now exists as the world of his deranged mind. Saint Max — the man who is confronted by "the world of the moderns" in the form of the fantasy-making youth — has necessarily to declare that "almost the whole of mankind consists of veritable fools, inmates of a mad-house" (p.. 57).

The whimsy which Saint Max discovers in the heads of people is nothing but his own whimsy — the whimsy of the "saint" who views the world *sub specie aeterni* [under the aspect of eternity — see Spinoza, Ethics] and who takes both the hypocritical phrases of people and their illusions for the true motives of their actions;

that is why our naive, pious man confidently pronounces the great proposition: "Almost all mankind clings to something higher" (p. 57).

"Whimsy" is "a fixed idea", i.e., "an idea which has subordinated man to itself" or — as is said later in more popular form — all kinds of absurdities which people "*have stuffed into their heads*". With the utmost ease, Saint Max arrives at the conclusion that everything that has subordinated people to itself — for example, the need to produce in order to live, and the relations dependent on this — is such an ‚absurdity" or "*fixed idea*". Since the child's world is the only "world of things", as we learned in the myth of "a man's life", everything that does not exist "for the child" (at times also for the animal) is in any case an "idea" and "easily also" a "fixed idea". We are still a long way from getting rid of the youth and the child.

The chapter on whimsy aims merely at establishing the existence of the category of whimsy in the history of "man". The actual struggle against whimsy is waged throughout the entire "book and particularly in the second part. Hence a few examples of whimsy can suffice us here.

On page 59, Jacques le bonhomme believes that

our newspapers are full of politics, because they are in the grip of the delusion that man was created in order to become a zoon politikon [political animal — Aristotle]".

Hence, according to Jacques le bonhomme, people engage in politics because our newspapers are full of them! If a church father were to glance at the stock exchange reports of our newspapers, he could not judge differently from Saint Max and would have to say: these newspapers are full of stock exchange reports because they are in the grip of the delusion that man was created in order to engage in financial speculation. Thus, it is not the newspapers that possess whimsies, but whimsies that possess "Stirner".

Stirner explains the condemnation of incest and the institutions of monogamy from "the holy", "they are the holy". If among the Persians incest is not condemned, and if the institution of polygamy occurs among the Turks, then in those places incest and polygamy are "the holy". It is not possible to see any difference between these two "holies" other than that the nonsense with which the Persians and Turks have "stuffed their heads" is different from that with which the Christian Germanic peoples have stuffed their heads. — Such is the church father's manner of "detaching himself" from history "in good time". — Jacques le bonhomme has so little inkling of the real, materialist causes for the condemnation of polygamy and incest in certain social conditions that he considers this condemnation to be merely the dogma of a creed and in common with every philistine imagines that when a man is imprisoned for a crime of this kind, it means that "moral purity" is confining him in a “house of moral correction” (p. 60) — just as jails in general seem to him to be houses for moral correction — in this respect he is at a lower level than the educated bourgeois, who has a better understanding of the matter — cf. the literature on prisons. “Stirner’s” “jails” are the most trite illusions of the Berlin burgher which for him, however, hardly deserve to be called a “house of moral correction”.

After Stirner, with the help of an “episodically included” “historical reflection”, has discovered that

“it had to come to pass that the whole man with all his abilities would prove to be religious” (p. 64) “so, too, in point of fact” “it is not surprising” — “for we are now so thoroughly religious” — “that” the oath “of the members of the jury condemns us to death and that by means of the ‘official oath’ the police constable, as a good Christian, has us put in the clink”.

When a gendarme stops him for smoking in the Tiergarten [7], the cigar is knocked out of his mouth not by the royal Prussian gendarme who is paid to do so and shares in the money from fines, but by the “official oath”. In precisely the same way the power of the bourgeois in the jury court becomes transformed for Stirner — owing to the pseudo-holy appearance which the *amis du commerce* assume here — into the power of making a vow, the power of the oath, into the “holy”. “Verily, I say unto you: I have not found so great faith, no, not in Israel.” (Matthew 8:10)

“For some persons a thought becomes a maxim, so that it is not the person who possesses the maxim, but rather the latter that possesses him, and with the maxim he again acquires a firm standpoint.” But “it is not of him that willeth, nor of him that runneth, but of God that sheweth mercy” (Romans 9: 16).

Therefore Saint Max has on the same page to receive several thorns in the flesh [2 Corinthians 12:7] and must give us a number of maxims: firstly, the maxim [to recognise] no maxims, with which goes, secondly, the maxim not to have any firm standpoint; thirdly, the maxim “although we *should* possess spirit, spirit *should* not possess us”; and fourthly, the maxim that one should also be aware of one’s flesh, “for only by being aware of his flesh is man fully aware of himself, and only by being fully aware of *himself*, is he aware or rational”.

C. The Impurely Impure History of Spirits

---

a) Negroes and Mongols

We now go back to the beginning of the "unique" historical scheme and nomenclature. The child becomes the Negro, the youth — the Mongol. See "The Economy of the Old Testament".

"The historical reflection on our mongolhood, which I shall include episodically at this point, I present without any claim to thoroughness or even to authenticity, but solely because it seems to me that it can contribute to clarifying the rest" (p. 87).

Saint Max tries to "clarify" for himself his phrases about the child and the youth by giving them world-embracing names, and he tries to "clarify" these world-embracing names by replacing them with his phrases about the child and the youth. "The *Negroid character* represents *antiquity*, dependence on *things*" *(child); "the Mongoloid character* — the period of dependence on *thoughts*, the Christian epoch" (*the youth*). (Cf. "The Economy of the Old Testament".) "The following words are reserved for the future: I am owner of the *world of things,* and I am owner of the *world of thoughts*" (pp. 87, 88). This "future" has already happened once, on page 20, in connection with the *man*, and it will occur again later, beginning with page 226.

First "historical reflection without claim to thoroughness or even to authenticity": Since Egypt is part of Africa where Negroes live, it follows that "included" "in the Negro era" (p. 88) are the "campaigns of Sesostris", which never took place, and the "significance of Egypt" (the significance it had also at the time of the Ptolemics, Napoleon's expedition to Egypt, Mohammed All, the Eastern question, the pamphlets of Duvergier de Haurannes, etc.), land of North Africa in general" (and therefore of Carthage, Hannibal's campaign against Rome, and "easily also", the significance of Syracuse and Spain, the Vandals, Tertuilian, the Moors, AI Hussein Abu Ali Ben Abdallah Ibn Sina, piratical states, the French in Algeria, Abd-el-Kader, Père Enfantin [8] and the font. new toads of the *Charivari*) (p. 88). Consequently, Stirner clarifies the campaigns of Sesostris, etc., by transferring them to the Negro era, and he clarifies the Negro era by "episodically including" it as a historical illustration of his unique thoughts "about our childhood years".

*Second "historical reflection": "*To the Mongoloid era belong the campaigns of the Huns and Mongols up to the Russians" (and *Wasserpolaken*[9]); thus here again the campaigns of the Huns and Mongols, together with the Russians, are "clarified" by their inclusion in the "Mongoloid era", and the "Mongoloid era" — by pointing out that it is the era of the phrase "dependence on thoughts", which we have already encountered in connection with the *youth.*

Third "historical reflection":

In the Mongoloid era the "value of my ego cannot possibly be put at a high level because the hard diamond of the non-ego is too high in price, because it is still too gritty and impregnable for it to be absorbed and consumed by my ego. On the contrary, people are simply exceptionally busy crawling about on this static world, this substance, like parasitic animalcules on a body from whose juices they extract nourishment, but nevertheless do not devour the body. It is the bustling activity of noxious insects, the industriousness of Mongols. Among the Chinese indeed everything remains as of old, etc.... Therefore" (because among the Chinese everything remains as of old) "in our Mongol era every change has only been reformatory and corrective, and not destructive, devouring or annihilating. The substance, the object remains. All our industriousness is only the activity of ants and the jumping of fleas ... juggling on the tightrope of the objective", etc. (p. 88. Cf. Hegel, Philosophie der Geschichte, pp. 113, 118, 119 (unsoftened substance). p. 140, etc., where China is understood as "substantiality").

We learn here, therefore, that in the true Caucasian era people will be guided by the maxim that the earth, "substance", the "object", the "static" has to be devoured, "consumed", "annihilated", "absorbed", "destroyed", and along with the earth the solar system that is inseparable from it. World-devouring "Stirner" has already introduced us to the "reformatory or corrective activity" of the Mongols as the youth's and Christian's "plans for the salvation and *correction* of the world" on page 36. Thus we have still not advanced a step. It is characteristic of the entire "unique" conception of history that the highest stage of this Mongol activity earns the title of "*scientific*" — from which already now the conclusion can be drawn, which Saint Max later tells us, that the culmination of the Mongolian heaven is the Hegelian kingdom of spirits. *Fourth "historical reflection"*. The world on which the Mongols crawl about is now transformed by means of a "flea jump" into the "positive", this into the "precept", and, with the help of a paragraph on page 89, the precept becomes "morality". "Morality appears in its first form as custom" — hence it conies forward as a person, but in a trice it becomes transformed into a sphere:

"To act in accordance with the morals and customs of one's country means here" (i.e., in the sphere of morality) "to be moral....... Therefore" (because this occurs in the sphere of morality as a custom) "pure, moral behaviour in the most straightforward form is practised in ... China! "

Saint Max is unfortunate in his examples. On page 116 in just the same way he attributes to the North Americans the "religion of honesty". He regards the two most rascally nations on earth, the patriarchal swindlers — the Chinese, and the civilised swindlers — the Yankees, as "straightforward", "moral" and "honest". If he had looked up his crib he could have found the North Americans classed as swindlers on page 81 of the *Philosophie der Geschichte* and the Chinese ditto on page 130.

“One” — that friend of the saintly worthy man — now helps him to arrive at *innovation*, and from this an “*and*” brings him back to *custom*, and thus the material is prepared for achieving a masterstroke in the

Fifth historical reflection: ‘There is in fact no doubt that by means of custom man protects himself against the importunity of things, of the world” — for example, from hunger;

“*and*” — as quite naturally follows from this —

“*founds a world of his* own” — which “Stirner” has need of now —

“*in which alone he feels in his native element and at home*”, — “*alone*”, after he has first by “custom” made himself “at home” in the existing “world” —

“*i.e., builds himself a heaven*” — because China is called the Celestial Empire.

“*For indeed heaven has no other significance than that of being the real homeland of man*” — in this context, however, it signifies the imagined unreality of the real homeland —

“*where nothing alien any longer prevails upon him*”, i.e., where what is his own prevails upon him as something alien, and all the rest of the old story. “Or rather”, to use Saint Bruno’s words, or “it is easily possible”, to use Saint Max’s words, that this proposition should read as follows:

1.Stirner’s proposition without claim to thoroughness or even to authenticity	**Clarified proposition**
“There is in fact no doubt that by means of custom man protects himself against the importunity of things, of the world, and founds a world of his own, in which alone he feels in his native element and at home, i.e., builds himself a heaven. ***For indeed ‘heaven’ has no other significance than that of being the real homeland of man, where nothing alien any longer prevails upon him and rules over him, no earthly influence any longer estranges him from himself, in***	***2.“There is in fact no doubt” that because China is called the Celestial Empire, because “Stirner” happens to be speaking of China and as he is “accustomed” by means of ignorance “to protect himself against the importunity of things, ,f the world, and to found a world of his own, in which alone he feels in his native element and at home” — therefore he “builds himself a heaven” out of the Chinese Celestial Empire. “For indeed” the importunity of the world, of things, “has no other significance than that of being the real” hell of the unique, “in***

short, where earthly dross is thrown aside and the struggle against the world has come to an end. where, therefore, nothing is forbidden him any more" (p. 89).

which" everything "prevails upon him and rules over him" as something "alien", but which he is able to transform into a "heaven" by "estranging himself" from all "earthly influences", historical facts and connections, and hence no longer thinks them strange; "in short", it is a sphere "where the earthly", the historical "dross is thrown aside", and where Stirner "does not find" in the "end" "of the world" any more "struggle" — and thereby everything has been said.

Sixth "historical reflection". On page 90, Stirner imagines that

"in China everything is provided for; no matter what happens, the Chinese always knows how he should behave, and he has no need to decide according to circumstances; no unforeseen event will overthrow his celestial calm".

Nor any British bombardment either — he knew exactly "how he should behave", particularly in regard to the unfamiliar steamships and shrapnel-bombs.[10] Saint Max extracted that from Hegel's *Philosophie der Geschichte,* pages 118 and 127, to which, of course, he had to add something unique, in order to achieve his reflection as given above.

"Consequently," continues Saint Max, "mankind climbs the first rung of the ladder of education by means of custom, and since it imagines that by gaining culture, it has gained heaven, the realm of culture or second nature, it actually mounts the first rung of the heavenly ladder" (p. 90).

"Consequently", i.e., because Hegel begins history with China, and because "the Chinese does not lose his equanimity", "Stirner" transforms mankind into a person who "mounts the first rung of the ladder of culture" and indeed does so "by means of custom", because China has no other meaning for Stirner than that of being the embodiment of "custom". Now it is only a question for our zealot against the holy of transforming the "ladder" into a "heavenly ladder", since China is also called the *Celestial* Empire. "Since mankind imagines" ("wherefrom" does Stirner "know everything that" mankind imagines, see *Wigand*, page 189) — and this ought to have been proved by Stirner — firstly that it transforms "culture" into the "heaven of culture", and secondly that it transforms the "heaven of culture" into the "culture of heaven" — (an alleged notion on the part of mankind which appears on page 91 as a notion of Stirner's and thereby receives its correct expression) — "so it *actually* mounts the first rung of the heavenly ladder". Since it *imagines* that it mounts the first rung of the heavenly ladder — so — it mounts it *actually*! "Since" the "youth" "imagines" that he becomes pure spirit, he does actually become such! See the "youth" and the "Christian" on the transition from the world of things to the world of the spirit, where the simple formula for this heavenly ladder of "unique" ideas already occurs.

Seventh historical reflection, page 90. "If Mongolism" (it follows immediately after the heavenly ladder, whereby "Stirner", through the alleged notion on the part of mankind, was able to ascertain the existence of a spiritual essence [*Wesen*]), "if Mongolism has established the existence of spiritual beings [*Wesen*]" (rather — if "Stirner" has established his fancy about the spiritual essence of the Mongols), "*then* the Caucasians have fought for thousands of years against these spiritual beings, in order to get to the bottom of them". (The youth, who becomes a man and "tries all the time" "to penetrate behind thoughts", the Christian, who "tries all the time" ',to explore the depths of divinity".) Since the Chinese have noted the existence of God knows what spiritual beings ("Stirner" does not note a single one, apart from his heavenly ladder) — so for thousands of years the Caucasians have to wrangle with "these" Chinese "spiritual beings"; moreover, two lines below Stirner puts on record that they actually "stormed the *Mongolian* heaven, the *tien*", and continues: "When will they destroy this heaven, when will they finally become *actual Caucasians* and *find themselves?*"

Here we have the negative unity, already seen earlier as man, now appearing as the "actual Caucasian", i.e., not Negroid, not Mongolian, but as the *Caucasian Caucasian*. This latter, therefore, as a concept, as essence, is here separated from the actual Caucasians, is counterposed to them as the "ideal of the Caucasian", as a „vocation" in which they should "find themselves", as a "destiny", a "task", as "the holy", as "the holy" Caucasian, "the perfect" Caucasian, "who indeed" is the Caucasian "in heaven — *God*".

"In the sedulous struggle of the Mongolian race, men had built a heaven" — so "Stirner" believes (p. 91), forgetting that actual Mongols are much more occupied with sheep than with heaven — "when the people of the Caucasian stock, so long as they ... *have* to do with heaven ... *undertook* the business of storming heaven." *Had built* a heaven, when ... so long as they *have*... [they] *undertook*. The unassuming "historical reflection" is here expressed in a *comecutio temporum* which also does not "lay claim" to classic form "or even" to grammatical correctness; the construction of the sentences corresponds to the construction of history. "Stirner's" "claims" "are restricted to this" and "thereby achieve their final goal".

Eighth historical reflection, which is the reflection of reflections, the alpha and omega of the whole of Stirner's history: Jacques le bonhomme, as we have pointed out from the beginning, sees in all the movement of nations that has so far taken place merely a sequence of heavens (p. 91), which can also be expressed as follows: successive generations of the Caucasian race up to the present day did nothing but squabble about the concept of morality (p. 92) and "their activity has been restricted to this" (p. 91). If they had got out of their heads this unfortunate morality, this apparition, they would have achieved something; as it was, they achieved nothing, absolutely nothing, and have to allow Saint Max to set them a task as if they were schoolboys. It is completely in accordance with his view of history that at the end (p. 92) he conjures up speculative philosophy so that "in it this heavenly kingdom, the kingdom of spirits and spectres, should find its proper order" — and that in a later passage speculative philosophy should be conceived as the "perfect kingdom of spirits".

Why it is that for those who regard history in the Hegelian manner the result of all preceding history was finally bound to be the kingdom of spirits perfected and brought into order in speculative philosophy — the solution of this secret "Stirner" could have very simply found by recourse to Hegel himself. To arrive at this result ',the concept of spirit must be taken as the basis and then it must be shown that history is the process of the spirit itself" *(Geschichte der Philosophie*, III, p. 91). After the "concept of spirit" has been imposed on history as its basis, it is very easy, of course, to "show" that it is to be discovered everywhere, and then to make this as a process "find its proper order".

After making everything "find its proper order", Saint Max can now exclaim with enthusiasm: "To desire to win freedom for the spirit, that is Mongolism", etc. (cf. p. 17: "To bring to light pure thought, etc. — that is the joy of the youth", etc.), and can declare hypocritically: "*Hence it is obvious* that Mongolism ... represents non-sensuousness and unnaturalness", etc. — when he ought to have said: it is obvious that the Mongol is only the disguised youth who, being the negation of the world of things, can also be called unnaturalness", "non-sensuousness", etc.

We have again reached the point where the "youth" can pass into the "man": "But who will transform the spirit into its nothing? *He*, who by means of the spirit represented nature as the futile, the finite, the transitory" (i.e., imagined it as such — and, according to page 16 et seq., this was done by the youth, later the Christian, then the Mongol, then the Mongoloid Caucasian, but properly speaking only by idealism), "he alone can also degrade the spirit" (namely 'it his imagination) "to the same futility" (therefore the Christian, etc.? No, exclaims "Stirner" resorting to a similar trick as on pages 19-20 in the case of the man). "I can do it, each of you can do it who operates and creates" (in his imagination) "as the unrestricted ego", "in a word, the *egoist* can do it" (p. 93), i.e., the man, the Caucasian Caucasian, who therefore is the perfect Christian, the true Christian, the holy one, the *embodiment* of the holy.

Before dealing with the further nomenclature, we also "should like at this point to include an historical reflection" on the origin of Stirner's "historical reflection about our Mongolism"; our reflection differs, however, from Stirner's 'n that it definitely "lays claim to thoroughness and authenticity". His whole historical reflection, just as that on the "ancients", is a concoction out of Hegel.

The Negroid state is conceived as "the child" because Hegel says on page 89 of his *Philosophie der Geschichte*:

"Africa is the country of the childhood of history." "in defining the African" (Negroid) "spirit we must entirety discard the category of universality" (p. 90) — i.e., although the child or the Negro has ideas, he still does not have the idea. "Among the Negroes consciousness has not yet reached a firm objective existence, as for example God, law, in which man would have the perception of his essence" ... "thanks to which, knowledge of an absolute being is totally absent. The Negro represents natural man in all his lack of restraint" (p. 90). "Although they must be conscious of their dependence on the natural" (on things, as "Stirner" says), "this, however, does not lead them to the consciousness of something higher" (p. 91).

Here we meet again all Stirner's determinations of the child and the Negro — dependence on things, independence of ideas and especially of "the idea", "the essence", "the absolute" (holy) "being", etc.

He found that in Hegel the Mongols and, in particular, the Chinese appear as the beginning of history and since for Hegel, too, history is a history of spirits (but not in such a childish way as with "Stirner"), it goes without saying that the Mongols brought the spirit into history and are the original representatives of everything "sacred". In particular, on page 110, Hegel describes the " *Mongolian* kingdom" (of the Dalai-Lama) as the "*ecclesiastical*" realm, the "kingdom of theocratic rule", a "spiritual, religious kingdom" — in contrast to the worldly empire of the Chinese. "Stirner", of course, has to identify China with the Mongols. In Hegel, on page 140, there even occurs the "*Mongolian principle*" from which "Stirner" derived his "*Mongolism*". Incidentally, if he really wanted to reduce the Mongols to the category of "idealism", he could have "found established" in the Dalai-Lama system and Buddhism quite different "spiritual beings" from his fragile "heavenly ladder". But he did not even have time to look properly at Hegel's *Philosophie der Geschichte.* The peculiarity and uniqueness of Stirner's attitude to history consists in the egoist being transformed into a "clumsy" copier of Hegel.

b) Catholicism and Protestantism (Cf. "The Economy of the Old Testament")

What we here call Catholicism, "Stirner" calls the "Middle Ages", but as he confuses (as "in everything") the pious, religious character of the Middle Ages, the religion of the Middle Ages, with the actual, profane Middle Ages in flesh and blood, we prefer to give the matter its right name at once.

"The Middle Ages" were a "lengthy period, in which people were content with the illusion of having the truth" (they did not desire or do anything else), "without seriously thinking about whether one must he true oneself in order to possess the truth". — "In the Middle Ages people" (that is, the whole of the Middle Ages) "mortified the flesh, in order to become capable of assimilating the holy" (p. 108).

Hegel defines the attitude to the divine in the Catholic church by saying

"that people's attitude to the absolute was as to something purely external" (Christianity in the form of externality) (Geschichte der Philosophie, Ill, p. 148, and elsewhere). Of course, the individual has to be purified in order to assimilate the truth, but "this also occurs in an external way, through redemptions, fasts, self-flagellations, visits to holy places, pilgrimages" (ibid., p. 140).

"Stirner" makes this transition by saying:

"In the same way, too, as people strain their eyes in order to see a distant object ... so they mortified the flesh, etc."

Since in "Stirner's" "book" the Middle Ages are identified with Catholicism, they naturally end with *Luther* (p. 108). Luther himself is reduced to the following definition, which has already cropped up in connection with the youth, in the conversation with Szeliga and elsewhere:

"Man, if he wants to attain truth, must become as true as truth itself. Only he who already has truth in faith can participate in it."

Concerning Lutheranism, Hegel says:

"The truth of the gospel exists only in the true attitude to it...... The essential attitude of the spirit exists only for the spirit.... Hence the attitude of the spirit to the content is that although the content is essential, it is equally essential that the holy and consecrating spirit should stand in relation to this content" (Geschichte der Philosophie, III, p. 234). "This then is the Lutheran faith — his" (i.e., man's) "faith is required of him and it alone can truly be taken into account" (ibid., p. 230). "Luther ... affirms that the divine is divine only insofar as it is apprehended in this subjective spirituality of faith" (ibid., p. 138).

"The doctrine of the" (Catholic) "church is truth as existent truth" (Philosophie der Religion, II, p. 331).

"Stirner" continues:

"Accordingly, with Luther the knowledge arises that truth, because it is thought, exists only for the thinking man, and this means that with regard to his object — thought — man must adopt a totally different standpoint, a pious" (per appos.), "scientific standpoint, or that of thinking" (p. 110).

Apart from the repetition which "Stirner" again "includes" here, only the transition from faith to thinking deserves attention. Hegel makes the transition in the following way:

"But this spirit" (namely, the holy and consecrating spirit) "is, secondly, essentially also thinking spirit. Thinking as such must also have its development in it", etc. ([*Geschichte der Philosophie*,] p. 234).

"Stirner" continues:

"This thought" ("that I am spirit, spirit alone") "pervades the history of the Reformation down to the present day" (p. 111).

From the sixteenth century onwards, no other history exists for "Stirner" than the history of the Reformation — and the latter only in the interpretation in which Hegel presents it.

Saint Max has again displayed his gigantic faith. He has again taken as literal truth all the illusions of German speculative philosophy; indeed, he has made them still more speculative, still more abstract. For him there exists only the history of religion and philosophy — and this exists for him only through the medium of Hegel, who with the passage of time has become the universal crib, the reference source for all the latest German speculators about principles and manufacturers of systems.

Catholicism = attitude to truth as thing, child, Negro, the "ancient".

Protestantism = attitude to truth in the spirit, youth, Mongol, the "modern".

The whole scheme was superfluous, since all this was already present in the section on "spirit".

As already mentioned in "The Economy of the Old Testament", it is now possible to make the child and the youth appear again in new transformations" within Protestantism, as "Stirner" actually does on page 112, where he conceives English, empirical philosophy as the child, in contrast to German, speculative philosophy as the youth. Here again he copies out *Hegel,* who here, as elsewhere in the "book", frequently appears as "*one*".

"One" — i.e., Hegel — "expelled Bacon from the realm of philosophy." "And, indeed, what is called English philosophy does not seem to have got any farther than the discoveries made by so-called clear intellects such as Bacon arid Hume" (p. 112).

Hegel expresses this as follows:

"Bacon is in fact the real leader and representative of what is called philosophy in England and beyond which the English have by no means gone as yet" (Geschichte der Philosophie, III, p. 254).

The people whom "Stirner" calls "clear intellects" Hegel (ibid., p. 255) calls "educated men of the world" — Saint Max on one occasion even transforms them into the "simplicity of childish nature", for the English philosophers have to represent the child. On the same childish grounds Bacon is not allowed to have "concerned himself with theological problems and cardinal propositions", regardless of what may be said in his writings (particularly *De Augmentis Scientiarum, Novum Organum* and the *Essays*). On the other hand, "German thought ... sees life only in cognition itself" (p. 112), for it is the *youth. Ecce iterum Crispinus!*

How Stirner transforms Descartes into a German philosopher, the reader can see for himself in the "book", p. 112.

D. Hierarchy

In the foregoing presentation Jacques le bonhomme conceives history merely as the product of abstract thoughts — or, rather, of his notions of abstract thoughts — as governed by these notions, which, in the final analysis, are all resolved into the "holy". This domination of the "holy", of thought, of the Hegelian absolute idea over the empirical world he further portrays as a historical relation existing at the present time, as the domination of the holy ones, the ideologists, over the vulgar world — as a *hierarchy*. In this hierarchy, what previously appeared *consecutively* exists *side by side,* so that one of the two coexisting forms of development rules over the other. Thus, the youth rules over the child, the Mongol over the Negro, the modern over the ancient, the selfless egoist (*citoyen*) over the egoist in the usual sense of the word (bourgeois), etc. — see "The Economy of the Old Testament". The "destruction" of the "world of things" by the "world of the spirit" appears here as the "domination" of the "world of thoughts" over the "world of things".

— The Professional Thinkers —

The outcome, of course, is bound to be that the domination which the "world of thoughts" exercises from the outset in history is at the end of the latter also presented as the real, actually existing domination of the thinkers — and, as we shall see, in the final analysis, as the domination of the speculative philosophers — over the world of things, so that Saint Max has only to fight against thoughts and ideas of the ideologists and to overcome them, in order to make himself "possessor of the world of things and the world of thoughts".

"Hierarchy is the domination of thought, the domination of the spirit. We are still — hierarchical to this day, we are under the yoke of those who rely on thoughts, and thoughts" — who has failed to notice it long ago? — "are the holy" (p. 97). (Stirner has tried to safeguard himself against the reproach that in his whole book he has only been producing "thoughts", i.e., the "holy,", by in fact nowhere producing any thoughts in it. Although in the Wigand periodical he ascribes to himself "virtuosity in thinking", i.e., according to his interpretation, virtuosity in the fabrication of the "holy" — and this we shall concede him.) — "Hierarchy is the supreme domination of spirit" (p. 467). — "The medieval hierarchy was only a weak hierarchy, for it was forced to allow all kinds of profane barbarism to exist unrestricted alongside it" ("how Stirner knows so much about what the hierarchy was forced to do", we shall soon see), "and only the Reformation steeled the power of the hierarchy" (p. 110). "Stirner" indeed thinks that "the domination of spirits was never before so all-embracing and omnipotent" as after the Reformation; he thinks that this domination of

spirits "instead of divorcing the religious principle from art, state and science, on the contrary, raised these wholly from actuality into the kingdom of tile spirit and made them religious".

This view of modern history merely dilates upon speculative philosophy's old illusion of the domination of spirit in history. Indeed, this passage even shows how pious Jacques le bonhomme in all good faith continually takes the world outlook derived from Hegel, and which has become traditional for him, as the *real world,* and "manoeuvres" on that basis. What may appear as "his own" and "unique" in this passage is the conception of this domination of the spirit as a *hierarchy* — and here, again, we will "include" a brief "historical reflection" on the origin of Stirner's "hierarchy". Hegel speaks of the philosophy of hierarchy in the following "transformations":

"We have seen in Plato's Republic the idea that philosophers should govern; now" (in the Catholic Middle Ages) "the time has come when it is affirmed that the spiritual should dominate, but the spiritual has acquired the meaning that the clerical, the clergy, should dominate. Thus, the spiritual is made a special being, the individual" (Geschichte der Philosophie, III, p. 132). — "Thereby actuality, the mundane, is forsaken by God ... a few individual persons are holy, the others unholy" (ibid., p. 136). "God-forsakenness" is more closely defined thus: "All these forms" (family, work, political life, etc.) "are considered nugatory, unholy" (Philosophie der Religion, II, p. 343). — "It is a union with worldliness which is unreconciled, worldliness which is crude in itself" (for this Hegel elsewhere also uses the word "barbarism"; cf., for example. Geschichte der Philosophie, III, p. 136) "and, being crude in itself, is simply subjected to domination." (Philosophie der Religion, If, pp. 342, 343). — "This domination" (the hierarchy of the Catholic church) "is, therefore, a domination of passion, although it should be the domination of the spiritual" (Geschichte der Philosophie, III, p. 134). — "The true domination of the spirit, however, cannot he domination of the spirit in the sense that what opposes it should be something subordinate" (ibid., p. 131). — "The true meaning is that the spiritual as such" (according to "Stirner" the "holy") "should be the determining factor, and this has been so until our times; thus, we see in the French Revolution" Following in the wake of Hegel, "Stirner" sees it) "that the abstract idea should dominate: state constitutions and laws should be determined by it, it should constitute the bond between people, and people should be conscious that that which they hold as valid are abstract ideas, liberty and equality, etc." (Geschichte dei. Philosophie, III, p. 132). The true domination of spirit as brought about by Protestantism, in contrast to its imperfect form in the Catholic hierarchy, is defined further in the sense that "the earthly is made spiritual in itself" (Geschichte der Philosophie, III, p. 185); "that the divine is realised in the sphere of actuality" (the Catholic God-forsakenness of actuality, therefore,

ceases to exist — Philosophie der Religion, II, p. 344); that the "contradiction" between holiness and worldliness "is resolved in morality" (Philosophie der Religion, II, p. 343); that "moral institutions" (marriage, the family, the state, earning one's livelihood, etc.) are "divine, holy" (Philosophie der Religion, II, p. 344).

Hegel expresses this true domination of spirit in two forms:

"State, government, low, property, civic order" (and, as we know from his other works, art, science, etc., as well), "all this is the religious... emerging in the form of the finite" (Geschichte der Philosophie, III, p. 185).

And, finally, this domination of the religious, the spiritual, etc., is expressed as the domination of philosophy:

"Consciousness of the spiritual is now" (in the eighteenth century) "essentially the foundation, and thereby domination has passed to philosophy" (Philosophie der Geschichte, p. 440).

Hegel, therefore, ascribes to the Catholic hierarchy of the Middle Ages the intention of wanting "to be the domination of spirit" and thereupon regards it as a restricted imperfect form of this domination of spirit, the culmination of which he sees in Protestantism and its alleged further development. However unhistorical this may be, nevertheless, Hegel is sufficiently historically-minded not to extend the use of the *name* "hierarchy" beyond the bounds of the Middle Ages. But Saint Max knows from this same Hegel that the later epoch is the "truth" of the preceding one; hence the epoch of the perfect domination of spirit is the truth of that epoch in which the domination of spirit was as yet imperfect, so that Protestantism is the truth of hierarchy and therefore *true hierarchy*. Since, however, only *true* hierarchy deserves to be called hierarchy, it is clear that the hierarchy of the Middle Ages had to be "weakly", and it is all the easier for Stirner to prove this since in the passages given above and in hundreds of other passages from Hegel the imperfection of the domination of spirit in the Middle Ages is portrayed. He only needed to copy these out, the whole of his "*own*" work consisting in substituting the word "hierarchy" for "domination of spirit". There was no need for him even to formulate the simple argument by means of which domination of spirit as such is transformed by him into hierarchy, since it has become the fashion among German theoreticians to give the name of the cause to the effect and, for example, to put back into the category of theology everything that has arisen out of theology and has not yet fully attained the height of the principles of these theoreticians — e.g., Hegelian speculation, Straussian pantheism, etc. — a trick especially prevalent in 1842. From the above-quoted passages it also follows that Hegel: 1) appraises the French Revolution as a new and more perfect phase of this domination of spirit; 2) regards philosophers as the rulers of the world of the nineteenth century; 3) maintains that now only abstract ideas have validity among people; 4) that he already regards marriage, the family, the state, earning one's livelihood, civic order, property, etc., as "divine and holy", as the "*religious principle*" and 5) that *morality* as worldly sanctity or as sanctified worldliness is represented as the highest and ultimate form of the domination of spirit over the world — all these things are repeated *word for word* in "Stirner".

Accordingly there is no need to say or prove anything more concerning Stirner's hierarchy, apart from why Saint Max copied out Hegel — a fact, however, for the explanation of which further material data are necessary, and which, therefore, is only explicable for those who are acquainted with 'the Berlin atmosphere. It is another question how the Hegelian idea of the domination of spirit arose, and about this see what has been said above.

Saint Max's adoption of Hegel's world domination of the philosophers and his transformation of it into a hierarchy are due to the extremely uncritical credulity of our saint and to a "holy" or unholy ignorance which is content with "seeing through" history (i.e., with glancing *through* Hegel's historical writings) without troubling to "know" many "things" about it. In general, he was bound to be afraid that as soon as he "learned" he would no longer be able to ‚abolish and dissolve" (p. 96), and, therefore, remain stuck in the "bustling activity of noxious insects" — a sufficient reason not to "proceed" to the "abolition and dissolution" of his own ignorance.

If, like Hegel, one designs such a system for the first time, a system embracing the whole of history and the present-day world in all its scope, one cannot possibly do so without comprehensive, positive knowledge, without great energy and keen insight and without dealing at least in some passages with empirical history. On the other hand, if one is satisfied with exploiting an already existing pattern, transforming it for one's "own" purposes and demonstrating this conception of one's own by means of isolated examples (e.g., Negroes and Mongols, Catholics and Protestants, the French Revolution, etc.) — and this is precisely what our warrior against the holy does — then absolutely no knowledge of history is necessary. The result of all this exploitation inevitably becomes comic; most of all comic when a jump is made from the past into the immediate present, examples of which we saw already in connection with whimsy".

As for the actual hierarchy of the Middle Ages, we shall merely note here that it did not exist for the people, for the great mass of human beings. For the great mass only feudalism existed, and hierarchy only existed insofar as it was itself either feudal or anti-feudal (within the framework of feudalism). Feudalism itself had entirely empirical relations as its basis. Hierarchy and its struggle against feudalism (the struggle of the ideologists of a class against the class itself) are only the ideological expression of feudalism and of the struggles developing within feudalism itself — which include also the struggles of the feudally organised nations among themselves.

Hierarchy is the ideal form of feudalism; feudalism is the political form of the medieval relations of production and intercourse. Consequently, the struggle of feudalism against hierarchy can only be explained by elucidating these practical material relations. This elucidation of itself puts an end to the previous conception of history which took the illusions of the Middle Ages on trust, in particular those illusions which the Emperor and the Pope brought to bear in their struggle against each other.

Since Saint Max merely reduces the Hegelian abstractions about the Middle Ages and hierarchy to "pompous words and paltry thoughts", there is no need to examine in more detail the actual, historical hierarchy.

From the above it is now clear that the trick can also be reversed and Catholicism regarded not just as a preliminary stage, but also as the negation of the real hierarchy; in which case Catholicism = negation of spirit, non-spirit, sensuousness, and then one gets the great proposition of Jacques le bonhomme — that the *Jesuits* "saved us from the *decay* and *destruction* of sensuousness" (p. 118). What would have happened to "us" If the "destruction" of sensuousness had come to pass, we do riot learn. The whole material movement since the sixteenth century, which did not save "us" from the "decay" of sensuousness, but, on the contrary, developed "sensuousness" to a much wider extent, does not exist for "Stirner" — it is the Jesuits who brought about all that. Compare, incidentally, Hegel's *Philosophie der Geschichte,* p. 425.

By carrying over the old domination of the clerics to modern times Saint Max interprets modern times as "*clericalism*"; and then by regarding this domination of the clerics carried over to modern times as something distinct from the old medieval clerical domination, he depicts it as domination of the ideologists, as "*scholasticism*". Thus clericalism = hierarchy as the domination of the spirit, scholasticism = the domination of the spirit as hierarchy.

"Stirner" achieves this simple transition to clericalism — which is no transition at all — by means of three weighty transformations.

Firstly, he "has" the "concept of clericalism" in anyone "who lives for a great idea, for a good cause" (still the good cause!), "for a doctrine, etc."

Secondly, in his world of illusion Stirner "comes up against" the age-old illusion of a world that has not yet learned to dispense with clericalism", namely — "to live and create for the sake of an *idea*, etc."

Thirdly, "it is the domination of the idea, i.e., clericalism", that is: "Robespierre, for example" (for example!), "Saint-Just, and so on" (and so on!) "were out-and-out priests", etc. All three transformations in which clericalism is "discovered", "encountered" and "called upon" (all this on p. 100), therefore, express nothing more than what Saint Max has already repeatedly told us, namely, the domination of spirit, of the idea, of the holy, over "life" (Ibid.).

After the "domination of the idea, i.e., clericalism" has thus been foisted upon history, Saint Max call, of course, without difficulty find this "clericalism" again in the whole of preceding history, and thus depict "Robespierre, for example, Saint-Just, and so on" as priests and identify them with Innocent III and Gregory VII, and so all uniqueness vanishes in the face of *the unique*. All of them, properly speaking, are merely different *names*, different disguises for one person, "clericalism", which made all history from the beginning of Christianity. As to how. with this sort of conception of history, "all cats become grey", since all historical differences are "abolished" and "resolved" in the "notion of clericalism" — as to this, Saint Max at once gives us a striking example in his "Robespierre, for example, Saint-Just, and so on". Here we are first given Robespierre as an "example" of Saint-Just, and Saint-Just — as an "and-so-on" of Robespierre. It is then said:

"These representatives of holy interests are confronted by a world of innumerable 'personal', earthly interests."

By whom were they confronted? By the Girondists and Thermidorians, who (see "for example" R. Levasseur's *Mémoires*, "and so on I.e. Nougaret, *Histoire des prisons*; Barère; "*Deux amis de la liberté*, [11] *(et du commerce*); Montgaillard, *Histoire de France*; Madame Roland, *Appel à la postérité;* J. B. Louvet's *Mémoires* and even the disgusting *Essais historiques* by Beaulieu, etc., etc., as well as all the proceedings before the revolutionary tribunal, "and so on") constantly reproached them, the real representatives of revolutionary power, i.e., of the class which *alone* was truly revolutionary, the "innumerable" masses, for violating "sacred interests", the constitution, freedom, equality, the rights of man, republicanism, law, *sainte propriété*, "for example" the division of powers, humanity, morality, moderation, "and so on". They were opposed by all the *priests*, who accused them of violating all the main and secondary items of the religious and moral catechism (see "for example" *Histoire du clergé de France pendant la revolution*, by M. R., Paris, *libraire catholique*, 1828, "and so on"). The historical comment of the bourgeois that during the *règne de la terreur* "Robespierre, for example, Saint-Just, and so on" cut off the beads of honnêtes *gens* (see the numerous writings of the simpleton Monsieur Peltier, "for example", *La conspiration de Robespierre* by Montjoie, "and so on") is expressed by Saint Max in the following transformation:

"Because the revolutionary priests and school-masters served Man, they cut the throats of men."

This, of course, saves Saint Max the trouble of wasting even one "unique" little word about the actual, empirical grounds for the cutting off of heads — grounds which were based on extremely worldly interests, though not, of course, of the stockjobbers, but of the "innumerable" masses. An earlier "priest", *Spinoza*, already in the seventeenth century had the brazen audacity to act the "strict school-master" of Saint Max, by saying: "Ignorance is no argument."' Consequently Saint Max loathes the priest Spinoza to such an extent that he accepts his anti-cleric, the priest *Leibniz*, and for all such astonishing phenomena as the terror, "for example", the cutting off of heads, "and so on", produces "sufficient grounds", viz., that "the ecclesiastics stuffed their heads with something of the kind" (p. 98).

Blessed Max, who has found sufficient grounds for everything ("I have now found the ground into which my anchor is eternally fastened, ,b in the idea, "for example", in the "clericalism", "and so on,' of "Robespierre, for example, Saint-Just, and so on", George Sand, Proudhon, the chaste Berlin seamstress,' etc.) — this blessed Max "does not blame the class of the bourgeoisie for having asked its egoism how far it should give way to the revolutionary *idea as such*". For Saint Max "the revolutionary idea" which inspired the *habits bleus* [12] and *honnêtes gens* of 1789 is the same "idea" as that of the sansculottes of 1793, *the same* idea concerning which people deliberate whether to "give way" to it — but no further "space can be given"' to any "idea" about this point.

We now come to present-day hierarchy, to the domination of the idea in ordinary life. The whole of the second part of "the book" is filled with struggle against this "hierarchy". Therefore we shall deal with it in detail when we come to this second part. But since Saint Max, as in the section on "whimsy", takes delight in anticipating his ideas here and repeats what comes later in the beginning, as he repeats the beginning in what comes later, we are compelled already at this point to note a few examples of his hierarchy. His method of writing a book is the unique "egoism" which we find in the whole book. His self-delight stands in inverse proportion to the delight experienced by the reader.

Since the middle class demand love for *their* kingdom, their regime, they want, according to Jacques le bonhomme, to "establish the kingdom of love on earth" (p. 98). Since they demand respect for their domination and for the conditions in which it is exercised, and therefore want to usurp domination over respect, they demand, according to this worthy man, the domination of *respect* as such, their attitude towards respect is the same as towards the holy spirit dwelling within them (p. 95). Jacques le bonhomme, with his faith that can move mountains, takes as the actual, earthly basis of the tons and bourgeois world the distorted form in which the sanctimonious and hypocritical ideology of the bourgeoisie voices their particular interests as universal interests. Why this ideological delusion assumes precisely this form for our saint, we shall see in connection with "political liberalism".

Saint Max gives us a new example on page 115, speaking of the family. He declares that, although it is very easy to become emancipated from the domination of one's own family, nevertheless, "refusal of allegiance easily arouses pangs of conscience", and so people retain family affection, the concept of the family, and therefore have the "holy conception of the family", the "holy" (p. 116).

— The Bourgeoisie and the Family —

Here again our good man perceives the domination of the holy where entirely empirical relations dominate. The attitude of the bourgeois to the institutions of his regime is like that of the Jew to the law; he evades them whenever it is possible to do so in each individual case, but he wants everyone else to observe them. If the entire bourgeoisie, in a mass and at one time, were to evade bourgeois institutions, it would cease to be bourgeoise conduct which, of course, never occurs to the bourgeois and by no means depends on their willing or running. [13] The dissolute bourgeois evades marriage and secretly commits adultery; the merchant evades the institution of property by depriving others of property by speculation, bankruptcy, etc.; the young bourgeois makes himself independent of his own family, if he can by in fact abolishing the family as far as he is concerned. But marriage, property, the family remain untouched in theory, because they are the practical basis on which the bourgeoisie has erected its domination, and because in their bourgeois form they are the conditions which make the bourgeois a bourgeois, just as the constantly evaded law makes the religious Jew a religious Jew. This attitude of the bourgeois to the conditions of his existence acquires one of its universal forms in bourgeois morality. One cannot speak at all of the family "*as such*". Historically, the bourgeois gives the family the character of the bourgeois family, in which boredom and money are the binding link, and which also includes the bourgeois dissolution of the family, which does not prevent the family itself from always continuing to exist. Its dirty existence has its counterpart in the holy concept of it in official phraseology and universal hypocrisy. Where the family is actually abolished, as with the proletariat, just the opposite of what "Stirner" thinks takes place. There the concept of the family does not exist at all, but here and there family affection based on extremely real relations is certainly to be found. In the eighteenth century the concept of the family was abolished by the philosophers, because the actual family was already in process of dissolution at the highest pinnacles of civilisation. The internal family bond, the separate components constituting the concept of the family were dissolved, for example, obedience, piety, fidelity in marriage, etc.; but the real body of the family, the property relation, the exclusive attitude in relation to other families, forced cohabitation — relations determined by the existence of children, the structure of modern towns, the formation of capital, etc. — all these were preserved, although with numerous violations, because the existence of the family is made necessary by its connection with the mode of production, which exists independently of the will of bourgeois society. That it was impossible to do without it was demonstrated in the most striking way during the French Revolution, when for a moment the family was as good as legally abolished. The family continues to exist even in the nineteenth century, only the process of its dissolution has become more general, not on account of the concept, but because of the higher development of industry and competition; the family still exists although its dissolution was long ago proclaimed by French and English socialists and this has at last penetrated also to the German church fathers, by way of French novels.

One other example of the domination of the idea in everyday life. Since school-masters may be told to find consolation for their scanty pay in the holiness of the cause they serve (which could only occur in Germany), Jacques le bonhomme actually believes that such talk is the reason for their low salaries (p. 100). He believes that "the, holy" in the present-day bourgeois world has an actual money value, he believes that the meagre funds of the Prussian state (see, inter alia, Browning on this subject [G. Browning, The domestic (and financial Condition of Great Britain; preceded by a Brief Sketch of her Foreign Policy: and of the Statistics and Politics of France, Russia, Austria and Prussia]) would be so increased by the abolition of "the holy" that every village school-master could suddenly be paid a ministerial salary.

This is the hierarchy of nonsense.

The "keystone of the magnificent cathedral" — as the great Michelet [Carl Michelet, Geschichte der letzten Système der Philosophie in Deutschland von Kant bis Hegel] puts it — of hierarchy is "sometimes" the work of "One".

"One sometimes divides people into two classes, the educated and the uneducated." (One sometimes divides apes into two classes, the tailed and the tailless.) "The former, insofar as they were worthy of their name, occupied themselves with thoughts, with the spirit." They "dominated in the post-Christian epoch and for their thoughts they demanded ... respect". The uneducated (the animal, the child, the Negro) are "powerless" against thoughts and "are dominated by them. That is the meaning of hierarchy."

The "educated" (the youth, the Mongol, the modern) are, therefore, again only occupied with "spirit", pure thought, etc.; they are metaphysicians by profession, in the final analysis Hegelians. "Hence" the "uneducated" are the non-Hegelians.' Hegel was indubitably "the most educated" Hegelian and therefore in his case it must "become apparent what a longing for things particularly the most educated man possesses". The point is that the "educated" and "uneducated" are within themselves in conflict with each other; indeed, in every man the "uneducated" is in conflict with the "educated". And since the greatest longing for things, i.e., for that which belongs to the "uneducated", becomes apparent in Hegel, it also becomes apparent here that "the most educated" man is at the same time "the most uneducated".

"There" (in Hegel) "reality should be completely in accordance with thought and no concept be without reality."

This should read: there the ordinary idea of reality should receive its complete philosophical expression, while Hegel imagines, on the contrary, that "consequently" every philosophical expression creates the reality that is in accordance with it. Jacques le bonhomme takes Hegel's illusion about his own philosophy for the genuine coin of Hegelian philosophy. The Hegelian philosophy, which in the form of the domination of the Hegelians over the non-Hegelians appears as the crown of the hierarchy, now conquers the last world empire.

"Hegel's system was the supreme despotism and autocracy of thought, the omnipotence and almightiness of the spirit" (p. 97).

Here, therefore, we find ourselves in the realm of spirits of Hegelian philosophy, which stretches from Berlin to Halle and Tübingen, the realm of spirits whose history was written by Herr Bayrhoffer [Karl Theodor Bayrhoffer, Die Idee und Geschichte der Philosophie] and for which the great Michelet collected the statistical data.

The preparation for this realm of spirits was the French Revolution, which "*did nothing* but transform *things* into *ideas about things*" (p. 115; cf. above Hegel on the revolution, p. [...])

"So people remained citizens" (in "Stirner", this occurs earlier, but "what Stirner says is not what he has in mind, and what he has in mind cannot be said", *Wigand*, p. 149) and "lived in reflection, they had their *eye* on an object, before which" (*per appos.)* "they felt reverence and fear". "Stirner" says in a passage on page 98: "The road to hell is paved with good intentions." But we say: the road to the unique is paved with bad concluding clauses, with oppositions, which are his "heavenly ladder" borrowed from the Chinese, and his rope of the objective" (p. 88) on which he makes his "flea-jumps". In accordance with this, for "modern philosophy *or* modern times" — since the emergence of the realm of spirits modern times are indeed nothing but modern philosophy — it is an easy matter to "transform the existing objects into notional objects, i.e., into concepts", page 114, a work which Saint Max continues.

We have already seen our knight of the rueful countenance even "before the mountains were brought forth", which he later moved by his faith, right at the beginning of his book, galloping headlong towards the great result of his "magnificent cathedral". His "donkey", apposition, could not jump swiftly enough for him; now, at last, on page 114, he has reached his goal and by means of a mighty "or" has transformed *modern times* into *modern philosophy.*

— On Ideas and Social Conditions —

Thereby ancient times (i.e., the ancient and modern, Negroid and Mongolian but, properly speaking, only pre-Stirnerian times) "reached their final goal". We can now reveal why Saint Max gave the title "Man" to the whole of the first part of his book and made out his entire history of miracles, ghosts and knights to be the history of "man". The ideas and thoughts of people were, of course, ideas and thoughts about themselves and their relationships, their consciousness of *themselves* and of people *in general* — for it was the consciousness not merely of a single individual but of the individual in his interconnection with the whole of society and about the whole of the society in which they lived. The conditions, independent of them, in which they produced their life, the necessary forms of intercourse connected herewith, and the personal and social relations thereby given, had to take the form — insofar as they were expressed in thoughts — of ideal conditions and necessary relations, i.e., they had to be expressed in consciousness as determinations arising from the concept of man *as such,* from human essence, from the nature of man, from man *as such.* What people were, what their relations were, appeared in consciousness as ideas of man as *such,* of his modes of existence or of his immediate conceptual determinations. So, after the ideologists had assumed that ideas and thoughts had dominated history up to now, that the history of these ideas and thoughts constitutes all history up to now, after they had imagined that real conditions had conformed to man *as such* and his ideal conditions, i.e., to conceptual determinations, after they had made the history of people's consciousness of themselves the basis of their actual history, after all this, nothing was easier than to call the history of consciousness, of ideas, of the holy, of established concepts — the history of "man" and to put it in the place of real history. The only distinction between Saint Max and all his predecessors is that he knows nothing about these concepts — even in their arbitrary isolation from real life, whose products they were — and his trivial creative work in his copy of Hegelian ideology is restricted to establishing his ignorance even of what he copies. — It is already evident from this how he can counterpose the history of the real individual in the form of *the unique* to his fantasy about the history of man.

The unique history takes place at the beginning in the Stoa in Athens, later almost wholly in Germany, and finally at the Kupfergraben [14] in Berlin, where the despot of "modern philosophy or modern times" set up his imperial residence. That already shows how exclusively national and local is the matter dealt with. Instead of world history, Saint Max gives a few and, what is more, extremely meagre and biased comments on the history of *German* theology and philosophy. If on occasion we appear to go outside Germany, it is only in order to cause the deeds and thoughts of other peoples, e.g., the French Revolution, to "reach their final goal" in Germany, namely, at the Kupfergraben. Only national-German facts are given, they are dealt with and interpreted in a national-German manner, and the result remains a national-German one. But even that is not enough. The views and education of our saint are not only German, but of a Berlin nature through and through. The role allotted to Hegelian philosophy is that which it plays in Berlin, and Stirner confuses Berlin with the world and world history. The "youth" is a Berliner; the good citizens that we encounter throughout the book are Berlin beer-drinking philistines. With such premises for the starting-point, it is natural that the result arrived at is merely one confined within the national and local framework. "Stirner" and his whole philosophical fraternity, among whom he is the weakest and most ignorant member, afford a practical commentary to the valiant lines of the valiant Hoffmann von Fallersleben:

In Germany alone, in Germany alone,

Would I for ever live.

The local Berlin conclusion of our valiant saint — that in Hegelian philosophy the world has "all gone" — enables him now without much expense to arrive at a universal empire of his "own". The Hegelian philosophy transformed everything into thought, into the holy, into apparition, into spirit, into spirits, into spectres. "Stirner" will fight against them, he will conquer them in his imagination and will erect on their dead bodies his "own", "unique", "corporeal" empire, the empire of the "whole fellow".

"For we wrestle not against flesh and blood, but against principalities, against powers, against the rulers of the darkness of this world, against spiritual wickedness in high places" (Ephesians 6:12).

Now "Stirner" has his "feet shod with the preparation" for waging the fight against thoughts. He has no need first to "take the shield of faith", for he has never laid it down. Armed with the "helmet" of disaster and the "sword" of spiritlessness (see ibid.), he goes into battle. "And it was given unto him to make war with the holy" but not "to overcome" it. (Revelation of St. John 13:7)

5. "Stirner" Delighted in His Construction

We now find ourselves again exactly where we were on page 19 in connection with the youth, who became the man, and on page 90 in connection with the Mongoloid Caucasian, who was transformed into the Caucasian Caucasian and "found himself". We are, therefore, at the third self-finding of the mysterious individual whose "arduous life struggle" Saint Max depicts for us. Only the whole story is now behind us, and, in view of the extensive material we have worked through, we must take a retrospective look at the gigantic corpse of the ruined man.

Though on a later page, where he has long ago forgotten his history, Saint Max asserts that "genius has long since been regarded as the creator of new world-historic productions" (p. 214), we have already seen that even his bitterest enemies cannot revile *his* history on that score, at any rate, for in it no individuals, let alone geniuses, make their appearance, but only ossified, crippled thoughts and Hegelian changelings.

Repetitio est mater studiorum. Saint Max, who expounded his whole history of "philosophy or time" only in order to find an opportunity for a few hurried studies of Hegel, finally repeats once again his whole unique history. However, he does it with a turn towards natural history, offering us important information about "unique" natural science, the reason being that for him, whenever the "world" has to play an important role, it immediately becomes transformed into *nature*. "Unique" natural science begins at once with the admission of its impotence. It does not examine the actual relation of man to nature, determined by industry and natural science, but proclaims a fantastic relation of man to nature.

"How little can man conquer! He has to allow the sun to trace its course, the sea to roll its waves, the mountains to tower to the sky" (p. 122).

Saint Max who, like all saints, loves miracles, but can only perform a logical miracle, is annoyed because he cannot make the sun dance the cancan, he grieves because he cannot still the ocean, he is indignant because he must allow the mountains to tower to the sky. Although on page 124 the world already becomes "prosaic" at the end of antiquity, it is still, for our saint, highly unprosaic. For him it still is the "sun" and riot the earth that traces its course, and to his sorrow he cannot *à la* Joshua command "sun, stand thou still: On page 123, Stirner discovers that

at the end of the ancient world, "spirit" "again foamed and frothed over irresistibly because gases" (spirits) "developed within it and, after the mechanical impact from outside became ineffective, chemical tension, which stimulate in the interior, began to come into wonderful play".

This sentence contains the most important data of the "unique" philosophy of nature, which on the previous page had already arrived at the conclusion that for man nature is the "unconquerable". Earthly physics knows nothing about a mechanical impact which becomes ineffective — *unique* physics alone has the merit of this discovery. Earthly chemistry knows no "gases" which stimulate "chemical tensions" and, what is more, "in the interior". Gases which enter into new combinations, into new chemical relations, do not stimulate any "tensions", but at most lead to a fall of tension, insofar as they pass into a liquid state of aggregation and thereby their volume decreases to something less than one-thousandth of their former volume. If Saint Max feels "tensions" "in" his own "interior" due to "gases", these are highly "mechanical impacts", and by no means "chemical tensions". They are produced by a chemical transformation, determined by physiological causes, of certain mixtures into others, whereby part of the constituents of the former mixture becomes gaseous, therefore, occupies a larger volume arid, in the absence of space for it, causes a "mechanical impact" or pressure towards the outside. [That] these nonexistent "chemical tensions" "come" into extremely "wonderful play" in Saint Max's "interior", namely, this time in his *head,* "we see" from the role they play in "unique" natural science. Incidentally, it is to be desired that Saint Max would no longer withhold from the profane natural scientists what nonsense he has in mind with the crazy expression "chemical tensions", which moreover "stimulate in the interior" (as though a "mechanical impact" on the stomach does not "stimulate it in the interior" as well).

Saint Max wrote his "unique" natural science only because on this occasion he was unable to touch on the ancients in decent fashion without at the same time letting fall a few words about the "world of things", about nature.

At the end of the ancient world the ancients, we are assured here, are all transformed into Stoics, "whom *no* collapse of the world" (how many times is it supposed to have collapsed "could put out of countenance" (p. 123). Thus, the ancients become Chinese, who also cannot be thrown down from the heavens of their tranquillity by any unforeseen event" (or idea") (p. 90). Indeed, Jacques le bonhomme seriously believes that against the last of the ancients "the mechanical impact from outside became ineffective". How far this corresponds to the actual situation of the Romans and Greeks at the end of the ancient world, to their complete lack of stability and confidence, which could hardly oppose any remnant of *vis inertiae* to the "mechanical impact" — on this point compare, *inter alia*, Lucian. The powerful mechanical shocks which the Roman empire received as a result of its division among several Caesars and their wars against one another, as a result of the colossal concentration of property, particularly landed property, in Rome, and the decrease in Italy's population caused by this, and as a result of the [pressure of the] Huns and Teutons — these shocks, in the opinion of our saintly historian, "became ineffective"; only the “chemical tensions”, only the “gases” which Christianity “stimulated in the interior” overthrew the Roman Empire. The great earthquakes [in the West] and in the East, and other “mechanical impacts” which buried hundreds of thousands of people under the [ruins] of their towns and [which by no] means left the consciousness of people unchanged, were presumably, according to “Stirner”, also “ineffective” or were chemical tensions. And “ *in fact”* (!) “ancient history ends in this, that I have made the world my property” — which is proved by means of the biblical saying: “All things are delivered unto me” (i.e., Christ) “of my Father. ,a Here, therefore, I = Christ. In this connection, Jacques le bonhomme cannot refrain from believing the Christian that he could move mountains, etc., if he “only wanted to”. As a Christian he proclaims himself the lord of the world, but he is this only *as a Christian*; he proclaims himself the “owner of the world”. “Thereby egoism won its first full victory, since I elevated myself to be the owner of the world” (p. 124). In order to rise to the level of the perfect Christian, Stirner’s ego had only to carry through the struggle to become *poor in spirit* as well (which he succeeded in doing even before the mountains arose). “Blessed are the poor in spirit: for theirs is the kingdom of heaven."” Saint Max has reached perfection as regards poverty of spirit and even boasts of it in his great rejoicing before the Lord.

Saint Max, poor in spirit, believes in the fantastic gas formations of the Christians arising from the decomposition of the ancient world. The ancient Christian owned nothing in this world and was, therefore, satisfied with his imaginary heavenly property and his divine right to ownership. Instead of making the world the possession of the people, he proclaimed himself and his ragged fraternity to be “God’s own possession” (1 Peter 2: 9). According to “Stirner”, the Christian idea of the world is the world into which the ancient world is actually dissolved, although this is at most [a world] of fantasy into which the world of ancient ideas has [been transformed] and in which the Christian [by faith] can move mountains, can feel [all-powerful] and press forward to a position where the “mechanical impact is ineffective”. Since for “Stirner” people are no longer determined by the [external] world, are no longer driven forward by the mechanical impact of the need to produce, since, in general, the mechanical impact, and with it the sexual act as well, has ceased to operate, it is only by a miracle that they have been able to continue to exist. Of course, for German prigs and school-masters with a gaseous content like that of “Stirner”, it is far easier to be satisfied with the Christian fantasy about property — which is truly nothing but the property of Christian fantasy — than to describe the transformation of the real property relations and production relations of the ancient world.

That same primitive Christian who, in the imagination of Jacques le bonhomme, was the owner of the ancient world, actually belonged for the most part to the world of owners; he was a slave and could be sold on the market. But "Stirner", delighted in his construction, irrepressibly continues his rejoicing.

"The first property, the first splendour has been won!" (p. 124).

In the same way ' Stirner's egoism continues to gain property and splendour and to achieve "complete victories". The theological attitude of the primitive Christian to the ancient world is the perfect prototype of all his property and all his splendour. The following are the grounds given for this property of the Christian:

"The world has lost its divine character ... it has become prosaic, it is my property, which I dispose of as I (viz., the spirit) choose" (p. 124).

This means: the world has lost its divine character, therefore, it is freed from my fantasies for my own consciousness; it has become prosaic, consequently its relation to me is prosaic and it disposes of me n the prosaic way it favours, by no means to please me. Apart from the fact that "Stirner" here actually thinks that in ancient times the prosaic world did not exist and the divine principle held sway in the world, he even falsifies the Christian concept, which continually bemoans its impotence in relation to the world, and itself depicts its victory over the world in its fantasy as merely an ideal one, by transferring t to the day of judgment. Only when a great secular power took possession of Christianity and exploited it, whereupon, of course, it ceased to be unworldly, could Christianity imagine itself to be the owner of the world. Saint Max ascribes to the Christian the same false relation to the ancient world as he ascribes to the youth with regard to the "world of the child"; he puts the egoist in the same relation to the world of the Christian as he puts the man to the world of the youth. The Christian has now nothing more to do than to become poor in spirit as quickly as possible and perceive the world of spirit in all its vanity — just as he did with the world of things — in order to be able to "dispose as he chooses" of the world of spirit also, whereby he becomes a perfect Christian, an egoist. The attitude of the Christian to the ancient world serves, therefore, as the standard for the attitude of the egoist to the modern world. The preparation for this spiritual poverty was the content of "almost two thousand years" of life — a life whose main epochs, of course, took place only in Germany.

"After various transformations the holy spirit in the course of time became the absolute idea, which again in manifold refractions split up into the various ideas of love of mankind, civic virtue, rationality, etc." (pp. 125, 126).

The German stay-at-home again turns the thing upside-down. The ideas of love of mankind, etc. — coins whose impressions had already been totally worn away, particularly owing to their great circulation in the eighteenth century — were recast by Hegel in the sublimate of the absolute idea, but after this re-minting they were just as little successful in retaining their value abroad as Prussian paper money. The consistent conclusion — which has already appeared again and again — of Stirner's view of history is as follows:

"Concepts should play the decisive roll everywhere, concepts should regulate life, concepts should rule. That is the religious world to which Hegel gave systematic expression" (p. 126),

and which our good-natured philistine so much mistakes for the real world that on the following page (p. 127) he can say:

"Now nothing but spirit rules in the world."

Stuck fast in this world of illusion, he can (on p. 128) build first of all an "altar" and then "erect a church" "round this altar", a church whose "walls" have legs for making progress and "move ever farther forward". "Soon this church embraces the whole earth." He, the unique, and Szeliga, his servant, stand outside, they "wander round these walls, and are driven out to the very edge". "Howling with agonising hunger", Saint Max calls to his servant: "One step more and the world of the holy has conquered." But Szeliga suddenly ',sinks into the outermost abyss", which lies above him — a literary miracle! For, since the earth is a sphere, the abyss can only lie above Szeliga as soon as the church embraces the whole earth. So he reverses the laws of gravity, ascends backwards into heaven and thereby reflects honour on "unique" natural science, which is all the easier for him since, according to page 126, "the nature of the thing and the concept of relation" are a matter of indifference to "Stirner", "do not guide him in his treatment or conclusion", and the "relationship into which" Szeliga "entered" with gravity "is itself unique" by virtue of Szeliga's "uniqueness", and by no means "depends" on the nature of gravity or on how "others", for instance, natural scientists, "classify it". "Stirner" moreover objects to Szeliga's "action being separated from the real" Szeliga and ,assessed according to human standards".

Having thus arranged for decent accommodation in heaven for his I faithful servant, Saint Max passes on to the subject of h' is own I passion. On page 95 he discovers that even the "gallows" has the "colour of the holy"; "people loathe coming into contact with it, there is something uncanny, i.e., unfamiliar, strange about it". In order to transcend this strangeness of the gallows, he transforms it into his own gallows, which he can only do by hanging himself on it. The lion of Judah makes also this last sacrifice to egoism. [cf. Revelation of John 5:,5] The holy Christian allows himself to he nailed to the cross, not to redeem the cross, but to redeem people from their impiety; the unholy Christian hangs himself on the gallows in order to redeem the gallows from holiness or to redeem himself from the strangeness of the gallows.

"The first splendour, the first property has been won, the first complete victory achieved!" The holy warrior has now conquered history, he has transformed it into thoughts, pure thoughts, which are nothing but thoughts — and at the end of time only a host of thoughts confront him. And so Saint Max, having taken his "gallows" on his back, just like an ass that carries a cross, and his servant Szeliga, who was welcomed in heaven with kicks and has returned to his master with his head hanging, set out to fight against this host of thoughts or, rather, against the mere halo of these thoughts. This time 't is Sancho Panza, full of moral sayings, maxims and proverbs, who takes on himself the struggle against the holy, and Don Quixote plays the role of his pious and faithful servant. The honest Sancho fights just as bravely as the *caballero Manchego* [Don Quixote] did in the old days, and like him does not fail several times to mistake a herd of Mongolian sheep for a swarm of spectres. The plump Maritornes "in the course of time, after various transformations in manifold refractions", is transformed into a chaste Berlin seamstress, [Marie Wilhelmine Dähnhardt] dying of anaemia, a subject on which Saint Sancho composes an elegy, one which causes all young graduates and Guards lieutenants to remember Rabelais' statement that the world-liberating "soldier's prime weapon is the flap of his trousers". [Rabelais' Gargantua and Pantagmel]

Sancho Panza achieves his heroic feats by *perceiving* the entire opposing host of thoughts in its nullity and vanity. All his great deed is confined to mere perception which in the end leaves everything existing as it was, changing only his conception, and that not even of things, but of philosophical phrases about things.

Thus, after the ancients have been presented realistically as child, Negro, Negroid Caucasians, animal, Catholics, English philosophy, the uneducated, non-Hegelians, and the world of things, and the moderns have been presented idealistically as youth, Mongol, Mongoloid Caucasians, man, Protestants, German philosophy, the educated, Hegelians, and the world of thoughts — after everything has happened that was from time immemorial decided in the Council of Guardians, the time has at last arrived. The negative unity of the ancient and the modern, which has already figured as the man, the Caucasian, the Caucasian Caucasian, the perfect Christian, in servant's clothing, seen "through a glass darkly" (I Corinthians 13:12), can now, after the passion and death of Stirner on the gallows and Szeliga's ascent to heaven in full glory, return to the simplest nomenclature and appear in the clouds of heaven endowed with great power and majesty. [cf. Matthew 24:30] "And so it is said": what was previously "One" (see "Economy of the Old Testament"'/ has become "*ego*" — the negative unity of realism and idealism, of the world of things and the world of spirit. Schelling calls this unity of realism and idealism "indifference" or, rendered in the Berlin dialect, "*Jeichjiltigkeit;* in Hegel it becomes the negative unity in which the two moments are transcended. Saint Max who, being a proper German speculative philosopher, is still tormented by the "unity of opposites", is not satisfied with this;

he wants this unity to be visible to him in the form of a "corporeal individual", in a "whole fellow", and he is encouraged in this by Feuerbach's views expressed in the *Anekdota* [Ludwig Feuerbach, "Vorläufige Thesen zur Reformation der Philosophie"] and in the *Philosophie der Zukunft*. This "ego" of Stirner's which is the final outcome of the hitherto existing world is, therefore, not a "corporeal individual", but a category constructed on the Hegelian method and supported by oppositions, the further "flea-jumps" of which we shall trace in the New Testament. Here we shall merely add that in the final analysis this ego comes into existence because it has the same illusions about the world of the Christian as the Christian has about the world of things. just as the Christian takes possession of the world of things by "getting into his head" fantastic nonsense about them, so the "ego" takes possession of the Christian world, the world of thoughts, by means of a series of fantastic ideas about it. What the Christian imagines about his own relation to the world, "Stirner" accepts in good faith, finds excellent, and good-naturedly repeats after him.

"Therefore we conclude that a man is justified by faith without the deeds" (Epistle to the Romans 3 : 28).

Hegel, for whom the modern world was also resolved into the world of abstract ideas, defines the task of the modern philosopher, in contrast to that of the ancient, as consisting in the following: instead of, like the ancients, freeing himself from "natural consciousness" and "purging the individual of the immediate, sensuous method and making him into conceived and thinking substance" (into spirit), the modern philosopher should "abolish firm, definite, fixed ideas". This, he adds, is accomplished by "dialectics" (*Phänomenologie*, pp. 26, 27). The difference between "Stirner" and Hegel is that the former achieves the same thing without the help of dialectics.

6. The Free Ones

What role "the free ones" have to play here is stated in the economy of the Old Testament. We cannot help it that the ego, which we had approached so closely, now recedes from us again into the nebulous distance. It is not at all our fault that we did not pass at once to the ego from page 20 of "the book".

A. Political Liberalism

The key to the criticism of liberalism advanced by Saint Max and his predecessors is the history of the German bourgeoisie. We shall call special attention to some aspects of this history since the French Revolution.

The state of affairs in Germany at the end of the last century is fully reflected in Kant's *Critik der Practischen Vernunft*. While the French bourgeoisie, by means of the most colossal revolution that history has ever known, was achieving domination and conquering the Continent of Europe, while the already politically emancipated English bourgeoisie was revolutionising industry and subjugating India politically, and all the rest of the world commercially, the impotent German burghers did not get any further than "good will". Kant was satisfied with "good will" alone, even if it remained entirely without result, and he transferred the *realisation* of this good will, the harmony between it and the needs and impulses of individuals, to *the world beyond*. Kant's good will fully corresponds to the impotence, depression and wretchedness of the German burghers, whose petty interests were never capable of developing into the common, national interests of a class and who were, therefore, constantly exploited by the bourgeois of all other nations. These petty, local interests had as their counterpart, on the one hand, the truly local and provincial narrow-mindedness of the German burghers and, on the other hand, their cosmopolitan swollen-headedness. In general, from the time of the Reformation German development has borne a completely petty-bourgeois character. The old feudal aristocracy was, for the most part, annihilated in the peasant wars; what remained of it were either imperial petty princes who gradually achieved a certain independence and aped the absolute monarchy on a minute, provincial scale, or lesser landowners who partly squandered their little bit of property at the tiny courts, and then gained their livelihood from petty positions in the small armies and government offices — or, finally, Junkers from the backwoods, who lived a life of which even the most modest English *squire* or French *gentilhomme de province* would have been ashamed. Agriculture was carried on by a method which was neither parcellation nor large-scale production, and which, despite the preservation of feudal dependence and corvées, never drove the peasants to seek emancipation, both because this method of farming did not allow the emergence of any active revolutionary class and because of the absence of the revolutionary bourgeoisie corresponding to such a peasant class.

As regards the middle class, we can only emphasise here a few significant factors. It is significant that linen manufacture, i.e., an industry based on the spinning wheel and the hand-loom, came to be of some importance in Germany at the very time when in England those cumbersome tools were already being ousted by machines. Most characteristic of all is the position of the German middle class in relation to *Holland*. Holland, the only part of the Hanseatic League[15] that became commercially important, tore itself free, cut Germany off from world trade except for two ports (Hamburg and Bremen) and since then dominated the whole of German trade. The German middle class was too impotent to set limits to exploitation by the Dutch. The bourgeoisie of little Holland, with its well-developed class interests, was more powerful than the far more numerous German middle class with its indifference and its divided petty interests. The fragmentation of interests was matched by the fragmentation of political organisation, the division into small principalities and free imperial cities. How could *political* concentration arise in a country which lacked all the *economic* conditions for it?

The impotence of each separate sphere of life (one can speak here neither of estates nor of classes, but at most of former estates and classes not yet born) did not allow any one of them to gain exclusive domination. The inevitable consequence was that during the epoch of absolute monarchy, which assumed here its most stunted, semi-patriarchal form, the special sphere which, owing to division of labour, was responsible for the administration of public interests acquired an abnormal independence, which became still greater in the bureaucracy of modern times. Thus, the state built itself up into an apparently independent force, and this position, which in other countries was only transitory — a transition stage — it has maintained in Germany until the present day. This position of the state explains both the conscientiousness of the civil servant, which is found nowhere else, and all the illusions about the state which are current in Germany, as well as the apparent independence of German theoreticians in relation to the middle class — the seeming contradiction between the form in which these theoreticians express the interests of the middle class and these interests themselves.

The characteristic form which French liberalism, based on real class interests, assumed in Germany we find again in Kant. Neither he, nor the German middle class, whose whitewashing spokesman he was, noticed that these theoretical ideas of the bourgeoisie had as their basis material interests and a *will* that was conditioned and determined by the material relations of production. Kant, therefore, separated this theoretical expression from the interests which it expressed; he made the materially motivated determinations of the will of the French bourgeois into *pure* self-determinations of "*free will*", of the will in and for itself, of the human will, and so converted it into purely ideological conceptual determinations and moral postulates. Hence the German petty bourgeois recoiled in horror from the practice of this energetic bourgeois liberalism as soon as this practice showed itself, both in the Reign of Terror and In shameless bourgeois profit-making.

Under the rule of Napoleon, the German middle class pushed its petty trade and its great illusions still further. As regards the petty-trading spirit which predominated in Germany at that time, Saint Sancho can, *inter alia*, compare Jean Paul, to mention only works of fiction, since they are the only source open to him. The German citizens, who railed against Napoleon for compelling them to drink chicory [16] and for disturbing their peace with military billeting and recruiting of conscripts, reserved all their moral indignation for Napoleon and all their admiration for England; yet Napoleon rendered them the greatest services by cleaning out Germany's Augean stables and establishing civilised means of communication, whereas the English only waited for the opportunity to exploit them *à tort et à travers* [at random, recklessly] In the same petty-bourgeois spirit the German princes imagined they were fighting for the principle of legitimism and against revolution, whereas they were only the paid mercenaries of the English bourgeoisie. In the atmosphere of these universal illusions it was quite in the order of things that the estates privileged to cherish illusions — ideologists, school-masters, students, members of the *Tugendbund* [17] — should talk big and give a suitable high-flown expression to the universal mood of fantasy and indifference.

The political forms corresponding to a developed bourgeoisie were passed on to the Germans from outside by the July [1830] revolution — as we mention only a few main points we omit the intermediary period. Since German economic relations had by no means reached the stage of development to which these political forms corresponded, the middle class accepted them merely as abstract ideas, principles valid in and for themselves, pious wishes and phrases, Kantian self-determinations of the will and of human beings as they ought to be. Consequently their attitude to these forms was far more moral and disinterested than that of other nations, i.e., they exhibited a highly peculiar narrow-mindedness and remained unsuccessful in all their endeavours.

Finally the ever more powerful foreign competition and world intercourse — from which it became less and less possible for Germany to stand aside — compelled the diverse local interests in Germany to adopt some sort of common attitude. Particularly since 1840, the German middle class began to think about safeguarding these common interests; its attitude became national and liberal and it demanded protective tariffs and constitutions. Thus it has now got almost as far as the French bourgeoisie in 1789.

If, like the Berlin ideologists, one judges liberalism and the state within the framework of local German impressions, or limits oneself merely to criticism of German-bourgeois illusions about liberalism, instead of seeing the correlation of liberalism with the real interests from which it originated and without which it cannot really exist — then, of course, one arrives at the most banal conclusions. This German liberalism, in the form in which it expressed itself up to the most recent period, is, as we have seen, even in its popular form, empty enthusiasm, ideological reflections about *real* liberalism. How easy it is, therefore, to transform its content wholly into philosophy, into pure conceptual determinations, into “rational cognition"! Hence if one is so unfortunate as to know even this bourgeoisified liberalism only in the sublimated form given it by Hegel and the school-masters who depend on him, then one will arrive at conclusions belonging exclusively to the sphere of the holy. Sancho will provide us with a pitiful example of this.

“Recently” in active circles “so much has been said” about the rule of the bourgeois, “that it is not surprising that news of it”, if only through the medium of L. Blanc (translated by the Berliner Buhl), [reference to Louis Blanc, Histoire de dix ans 1830-1840, which appeared in Berlin in 1844-45 in Ludwig Buhl’s translation under the title Geschichte der zehn jahre] etc., “has even penetrated to Berlin” and there attracted the attention of easy-going school-masters (*Wigand*, p. 190). It cannot, however, be said that “Stirner” in his method of appropriating current ideas has “adopted a particularly fruitful and profitable style” (*Wigand*, ibid.) — as was already evident from his exploitation of Hegel and will now be further exemplified.

It has not escaped our school-master that in recent times the liberals have been identified with the bourgeois. Since Saint Max identifies the bourgeois with the good burghers, with the petty German burghers, he does not grasp what has been transmitted to him as it is in fact and as it is expressed by all competent authors — viz., that the liberal phrases are the idealistic expression of the real interests of the bourgeoisie — but, on the contrary, as meaning that the final goal of the bourgeois is to become a perfect liberal, a citizen of the state. For Saint Max the bourgeois is not the truth of the *citoyen*, but the *citoyen* the truth of the bourgeois. This conception, which is as holy as it is German, goes to such lengths that, on page 130, “the middle class” (it should read: the domination of the bourgeoisie) is transformed into a “*thought, nothing but* a thought” and “the state” comes forward as the “true man”, who in the “Rights of Man” confers the rights of “Man”, the true solemnisation on each individual bourgeois. And — all this occurs after the illusions about the state and the rights of man had already been adequately exposed in the *Deutsch-Französische Jahrbücher*, [In the *Deutsch-Französische Jahrbücher* this was done, in view of the context, only in relation to the rights of man proclaimed by the French Revolution. [Cf. Marx*,* *On the Jewish Question*] incidentally, this whole conception of competition as “the rights of man” can already be found among representatives of the bourgeoisie a century earlier (John Hampden, Petty, Boisguillebert, Child, etc.). On the relation of the theoretical liberals to the bourgeois compare what has been said [above] on the relation of the ideologists of a class to the class itself.] a fact which Saint Max notices at last in his "Apologetical Commentary" anno 1845. Hence he can transform the bourgeois — having separated the bourgeois as a liberal from the empirical bourgeois — into a holy liberal, just as he transforms the state into the "holy", and the relation of the bourgeois to the modern state into a holy relation, into a *cult* (p. 131) — and with this, in effect, he concludes his criticism of political liberalism. He has transformed it into the "holy".

We wish to give here a few examples of how Saint Max embellishes this property of his with historical arabesques. For this purpose he uses the French Revolution, concern rig which a small contract to supply him with a few data has been negotiated by his history-broker, Saint Bruno.

On the basis of a few words from Bailly, obtained moreover through the intermediary of Saint Bruno's *Denkwürdigkeiten*, [reference to Edgar Bauer's essay "Bailly und die ersten Tage der Französischen Revolution" in Denkwürdigkeiten zur Geschichte der neueren Zeit seit der Revolution, by Bruno and Edgar Bauer] the statement is made that through the convening of the States General "those who hitherto were subjects arrive at the consciousness that they are proprietors" (p. 132). On the contrary, *mon brave*! By the convening of the States General, those who hitherto were proprietors show their consciousness of being no longer subjects — a consciousness which was long ago arrived at, for example in the Physiocrats, and — in polemical form against the bourgeoisie — in Linguet *(Théorie des lois civiles,* 1767), Mercier, Mably, and, in general, in the writings against the Physiocrats. This meaning was also immediately understood at the beginning of the revolution — for example by Brissot, Fauchet, Marat, in the *Cercle social* [18] and by all the democratic opponents of Lafayette. If Saint Max had understood the matter as it took place independently of his history-broker, he would not have been surprised that "Bailly's words certainly *sound* [as if each man is ... were now a proprietor..." and that the bourgeois express... the rule of the proprietors ... that now the proprietors have become the bourgeoisie *par excellence.*] [19]

The "*statement* of the Bishop of Autun and Barère" is a *motion* tabled by the former on July 4 (not 8), with which Barère had nothing to do except that together with many others he supported it on July 8. It was carried on July 9, hence it is not at all clear why Saint Max speaks of "July 8". This motion by no means "destroyed" "the illusion that *each man, the individual*, was of importance", etc.; but it destroyed the binding force of the Cahiers given to the deputies, that is, the influence and the "importance", not of "each man, the individual", but of the feudal 177 *bailliages* and 431 *divisions des ordres*. By carrying the motion, the Assembly discarded the characteristic features of the old, feudal *États généraux*. [20] Moreover, it was at that time by no means a question of the correct theory of popular representation, but of highly practical, essential problems. Broglie's army held Paris at bay and drew nearer every day; the capital was in a state of utmost agitation; hardly a fortnight had passed since the *jeu de paume* and the *lit de justice* [21], the court was plotting with the bulk of the aristocracy and the clergy against the National Assembly; lastly, owing to the still existing feudal provincial tariff barriers, and as a result of the feudal agrarian system as a whole, most of the provinces were in the grip of famine and there was a great scarcity of money. At that moment it was a question of an *assemblée essentiellement active,* as Talleyrand himself put it, while the Cahiers of [the] aristocratic' and other reactionary groups provided the court with an opportunity, to declare [the] decision of the Assembly [void by referring] to the wishes of the constituents. The Assembly proclaimed its independence by carrying Talleyrand's motion and seized the power it required, which in the political sphere could, of course, only be done within the framework of political form and by making use of the existing theories of Rousseau, etc. (cf. *Le point du jour,* par Barère de Vieuzac, 1789, Nos. 15 and 17.) The National Assembly had to take this step because it was being urged forward by the immense mass of the people that stood behind it. By so doing, therefore, it did not at all transform itself into an "utterly egoistical chamber, completely cut off from the umbilical cord and ruthless" [p. 147]; on the contrary it actually transformed itself thereby into the *true organ* of the vast majority of Frenchmen, who would otherwise have crushed it, as they later crushed "utterly egoistical" deputies who "completely cut themselves off from the umbilical cord". But Saint Max, with the help of his history-broker, sees here merely the solution of a theoretical question; he takes the Constituent Assembly, six days before the storming of the Bastille, for a council of *church fathers* debating a point of dogma! The question regarding the "importance of each man, the individual", can, moreover, only arise in a democratically elected representative body, and during the revolution it only came up for discussion in the Convention, and for as empirical reasons as earlier the question of the *Cahiers*. A problem which the Constituent Assembly decided *also* theoretically was the distinction between the representative body of a ruling *class* and that of the ruling *estates;* and this political rule of the bourgeois class was determined by each individual's position, since it was determined by the relations of production prevailing at the time. The representative system is a very specific product of modern bourgeois society which is as inseparable from the latter as is the isolated individual of modern times.

Just as here Saint Max takes the 177 *bailliages* and 431 *divisions des ordres* for "individuals", so he later sees in the absolute monarch and his *car tel est notre plaisir* ["for this is our will" — the concluding words of royal edicts] the rule of the "individual" as against the constitutional monarch, the "rule of the apparition" (p. 141), and in the aristocrat and the guild-member he again sees the "individual" in contrast to the citizen (p. 137).

“The Revolution was not directed against reality, but against this reality, against this definite existence” (p. 145).

Hence, not against the really existing system of landownership, of taxes, of customs duties which hampered commerce at every turn, and the [... gap in the manuscript]

[... “Stirner” thinks] it makes no difference ["to ‘the good burghers’ who defends them] and their principles, whether an absolute or a constitutional king, a republic, etc. — For the “good burghers” who quietly drink their beer in a Berlin beer-cellar this undoubtedly “makes no difference”; but for the historical bourgeois it is by no means a matter of indifference. The “good burgher” “Stirner” here again imagines — as he does throughout this section — that the French, American and English bourgeois are good Berlin beer-drinking philistines. If one translates the sentence above from the language of political illusion into plain language, it means: “it makes no difference” to the bourgeoisie whether it rules unrestrictedly or whether its political and economic power is counterbalanced by other classes. Saint Max believes that an absolute king, or someone else, *could* defend the bourgeoisie just as successfully as it defends itself. And even “Its principles”, which consist in subordinating state power to “*chacun pour soi, chacun chez soi*” [each for himself and the devil take the hindmost] and exploiting it for that purpose — an “absolute monarch” is supposed to be able to do that! Let Saint Max name any country with developed trade and industry and strong competition where the bourgeoisie entrusts its defence to an “absolute monarch”.

After this transformation of the historical bourgeois into German philistines devoid of history, “Stirner”, of course, does not need to know any other bourgeois than “comfortable burghers and loyal officials"(!!) — two spectres who only dare to show themselves on “holy” German soil — and can lump together the whole class as ‚obedient servants” (p. 138). Let him just take a look at these obedient servants on the stock exchanges of London, Manchester, New York and Paris. Since Saint Max is well under way, he can now go *the whole hog* and, believing one of the narrow-minded theoreticians of the *Einundzwanzig Bogen* who savs that “liberalism is rational cognition applied to our existing conditions” [from the article “Preussen seit der Einsetzung Arndt’s bis zur Absetzung Bauer’s” published anonymously in the Einundzwanzig Bogen aus der Schweiz], can declare that the “liberals are fighters for reason”. It is evident from these [...] phrases how little the Germans have recovered [from] their original illusions about liberalism. Abraham “against hope believed in hope” ... and his faith “was imputed to him for righteousness” (Romans 4: 18 and 22).

“The state pays well, so that its good citizens can without danger pay poorly; it provides itself by means of good payment with servants from whom it forms a force — the police — for the protection of good citizens and the good citizens

willingly pay high taxes to the state in order to pay so much lower amounts to their workers" (p. 152).

This should read: the bourgeois pay their state well and make the nation pay for it so that without risk they should be able to pay poorly; by good payment they ensure that the state servants are a force available for their protection — the police; they willingly pay, and force the nation to pay high taxes so as to be able without danger to shift the sums they pay on to the workers as a levy (as a deduction from wages). "Stirner" here makes the new economic discovery that wages are a levy, a tax, paid by the bourgeois to the proletarian; whereas the other, mundane economists regard taxes as a tribute which the proletarian pays to the bourgeois. Our holy church father now passes from the holy middle class to the Stirnerian "unique" proletariat (p. 148). The latter consists of "rogues, prostitutes, thieves, robbers and murderers, gamblers, propertyless people with no occupation and frivolous individuals" (ibid.). They form the "dangerous proletariat" and for a moment are reduced by "Stirner" to "individual shouters", and then, finally, to 1I vagabonds", who find their perfect expression in the "*spiritual* vagabonds" who do not "keep within the bounds of a moderate way of thinking...

"So wide a meaning has the so-called proletariat or" (per appos.) "pauperism"! (p. 149).

On page 151 ["on the other hand,] the state sucks the life-blood" of the proletariat. Hence the entire proletariat consists of ruined bourgeois and ruined proletarians, of a collection of *ragamuffins*, who have existed in every epoch and whose existence *on a mass scale* after the decline of the Middle Ages preceded the mass formation of the ordinary proletariat, as Saint Max can ascertain by a perusal of English and French legislation and literature. Our saint has exactly the same notion of the proletariat as the "good comfortable burghers" and, particularly, the "loyal officials". He is consistent also in identifying the proletariat with pauperism, whereas pauperism is the position only of the ruined proletariat, the lowest level to which the proletarian sinks who has become incapable of resisting the pressure of the bourgeoisie, and it is only the proletarian whose whole energy has been sapped who becomes a pauper. Compare Sismondi, [Simonde de Sismondi, Nouveaux principes d'économie politique] Wade, [John Wade, History of the Middle and Working Classes] etc. "Stirner" and his fraternity, for example, can in the eyes of the proletarians, in certain circumstances count as paupers but never as proletarians.

Such are Saint Max's "own" ideas about the bourgeoisie and the proletariat. But since with these imaginations about liberalism, good burghers and vagabonds he, of course, gets nowhere, he finds himself compelled in order to make the transition to communism to bring in the actual, ordinary bourgeois and proletarians insofar as he knows about them from hearsay. This occurs on pages 15I and 152, where the lumpen-proletariat becomes transformed into "workers", into ordinary proletarians, while the bourgeois "in course of time" undergoes "occasionally" a series of "various transformations" and "manifold refractions". In one line we read: "*The propertied rule*", i.e., the profane bourgeois; six lines later we read: "The citizen is what he is by the grace of the state", i.e., the holy bourgeois; yet another six lines later: "The state is the *status* of the middle class", i.e., the profane bourgeois; this is then explained by saying that "the state gives the propertied" "their property in feudal possession" and that the "money and property" of the "capitalists", i.e., the holy bourgeois, Is such "state property" transferred by the state to "feudal possession". Finally, this omnipotent state is again transformed into the "state of the propertied", i.e., of the profane bourgeois, which is in accord with a later passage: "Owing to the revolution the *bourgeoisie became omnipotent*" (p. 156). Even Saint Max would never have been able to achieve these "heart-rending" and "horrible" contradictions — at any rate, he would never have dared to promulgate them — had he not had the assistance of the German word "*Bürger*", which he can interpret at will as "*citoyen*" or as *bourgeois*" or as the German "good burgher".

Before going further, we must take note of two more great politico-economic discoveries which our simpleton "brings into being" "in the depths of his heart" and which have in common with the "joy of youth" of page 17 the feature of being also "pure thoughts".

On page 150 all the evil of the existing social relations is reduced to the fact that "burghers and workers believe in the 'truth' of money". Jacques le bonhomme imagines that it is in the power of the "burghers" and "workers", who are scattered among all civilised states of the world, suddenly, one fine day, to put on record their "disbelief" in the "truth of money"; he even believes that if this nonsense were possible, something would be achieved by it. He believes that any, Berlin writer could abolish the "truth of money" with the same ease as he abolishes in his mind the "truth" of God or of Hegelian philosophy. That money is a necessary product of definite relations of production and intercourse and remains a "truth" so long as these relations exist — this, of course, is of no concern to a holy man like Saint Max, who raises his eyes towards heaven and turns his profane backside to the profane world.

The second discovery is made on page 152 and amounts to this, that "the worker cannot turn his labour to account" because he "falls into the hands" of "those who" have received "some kind of state property" "in feudal possession". This is merely a further explanation of the sentence on page 15I already quoted above where the state sucks the life-blood of the worker. And here everyone will immediately "put forward" "the simple reflection" — that "Stirner" does not do so is not "surprising" — how does it come about that the state has not given the "workers" also some sort of "state property" in "feudal possession". If Saint Max had asked himself this question he would probably have managed to do without his construction of the "holy" burghers, because he would have been bound to see the relation in which the propertied stand to the modern state.

By means of the opposition of the bourgeoisie and proletariat — as even "Stirner" knows — one arrives at communism. But *how* one arrives at it, *only* "Stirner" knows.

"The workers have the most tremendous power in their hands ... they have only to cease work and to regard what they have produced by their labour as their property and to enjoy it. This is the meaning of the workers' disturbances which flare up here and there" (p. 153).

Workers' disturbances, which even under the Byzantine Emperor Zeno led to the promulgation of a law (Zeno, *de novis operibus constitutio* [Decree on New Works]), which "flared up" in the fourteenth century in the form of the Jacquerie and Wat Tyler's rebellion, in 1518 on the *Evil May Day* in London, and in 1549 in the great uprising of the tanner Kett [22] and later gave rise to Act 15 of the second and third year of the reign of Edward VI, and a series of similar Acts of Parliament; the disturbances which soon afterwards, in 1640 and 1659 (eight uprisings in one year), took place in Paris and which already since the fourteenth century must have been frequent in France and England, judging by the legislation of the time; the constant war which since 1770 in England and since the revolution in France has been waged with might and cunning by the workers against the bourgeoisie — all this exists for Saint Max only "here and there", in Silesia, Poznan, Magdeburg and Berlin, "according to German newspaper reports".

What is produced by labour, according to Jacques le bonhomme's imagination, would continue to exist and be reproduced, as an object to be "regarded" and "enjoyed", even if the producers "ceased work".

As he did earlier in the case of money, now again our good burgher transforms "the workers", who are scattered throughout the civilised world, into a private club which has only to adopt a decision in order to get rid of all difficulties. Saint Max does not know, of course, that at least fifty attempts have been made in England since 1830, and at the present moment yet another is being made, to gather all the English workers into a single association and that highly empirical causes have frustrated the success of all these projects. He does not know that even a minority of workers who combine and go on strike very soon find themselves compelled to act in a revolutionary way — a fact he could have learned from the 1842 uprising in England and from the earlier Welsh uprising of 1839, in which year the revolutionary excitement among the workers first found comprehensive expression in the "sacred month", which was proclaimed simultaneously with a general arming of the people. [23] Here again we see how Saint Max constantly tries to pass off his nonsense as "*the* meaning" of historical facts (in which he is successful at best in relation to *his* "one") — historical facts "on which he foists his own meaning, which are thus bound to lead to nonsense" (*Wigand*, p. 194). Incidentally, it would never enter the head of any proletarian to turn to Saint Max for advice about the "meaning" of the proletarian movements or what should be undertaken at the present time against the bourgeoisie.

After this great campaign, our Saint Sancho returns to his Maritornes with the following fanfare:

"The state rests on the slavery of labour. If labour were to become free, the state would be lost" (p. 153).

— Free Labour —

The *modern* state, the rule of the bourgeoisie, is based on *freedom of labour*. The idea that along with freedom of religion, state, thought, etc., and hence "occasionally" "also" "perhaps" with freedom of labour, not I become free, but only one of my enslavers — this idea was borrowed by Saint Max himself, many times, though in a very distorted form, from the *Deutsch-Französische Jahrbücher*. Freedom of labour is free competition of the workers among themselves. Saint Max is very unfortunate in political economy as in *all other* spheres. Labour is free in all civilised countries; it is not a matter of freeing labour but of abolishing it.

B. Communism

Saint Max calls communism "social liberalism", because he is well aware how great is the disrepute of the word liberalism among the radicals of 1842 and the most advanced Berlin "free-thinkers". [24] This transformation gives him at the same time the opportunity and courage to put into the mouths of the "social liberals" all sorts of things which had never been uttered before "Stirner" and the refutation of which is intended to serve also as a refutation of *communism*.

Communism is overcome by means of a series of partly logical and partly historical constructions.

First logical construction.

Because "we have seen ourselves made into servants of egoists", "we should" not ourselves "become egoists ... but should rather see to it that egoists become impossible. We want to turn them all into ragamuffins, we want no one to possess anything, in order that 'all' should be possessors. — So say the social [liberals]. — Who is this person whom you call 'all'? It is 'society'" (p. 153).

With the aid of a few quotation marks Sancho here transforms "all" into a person, society as a person, as a subject = holy society, the holy. Now our saint knows what he is about and can let loose the whole torrent of his flaming anger against "the holy", as the result of which, of course, communism is annihilated.

That Saint Max here again puts *his* nonsense into the mouth of the "social [liberals]", as being the meaning of *their* words, is not "surprising". He identifies first of all "owning" as a private property-owner with "owning" in general. Instead of examining the definite relations between private property and production, instead of examining "owning" as a landed proprietor, as a rentier, as a merchant, as a factory-owner, as a worker — where "owning" would be found to be a quite distinct kind of owning, control over other people's labour — he transforms all these relations into "owning as such".

[...four pages of the manuscript missing here.

...] political liberalism, which made the nation" the supreme owner. Hence communism has no longer to "abolish" any "personal property" but, at most, has to equalise the distribution of "feudal possessions", to introduce *égalité* there.

On society as "supreme owner" and on the "ragamuffin", Saint Max should compare, *inter alia*, *L'Égalitaire* for 1840:

"Social property is a contradiction, but social wealth is a consequence of communism. Fourier, in contradistinction to the modest bourgeois moralists, repeats a hundred times that it is not a social evil that some have too much but that ill have too little", and therefore draws attention also to the "poverty of the rich", in La fausse industrie, Paris, 1835, p. 410.

Similarly as far back as 1839 — hence before Weitling's *Garantien* [der Harmonie und Freiheit] — it is stated in the German communist magazine *Die Stimme des Volks* (second issue, p. 14) published in Paris:

"Private property, the much praised, industrious, comfortable, innocent 'private gain', does obvious harm to the wealth of life." [This seems to be a quotation from the article "Politischer und Socialer Umschwung" published in Blätter der Zukunft, 1846, No. 5. Die Stimme des folks was probably mentioned by mistake]

Saint Sancho here takes as communism the ideas of a few liberals tending towards communism, and the mode of expression of some communists who, for very practical reasons, express themselves in a political form. After "Stirner" has transferred property to "society", all the members of this society in his eyes at once become paupers and ragamuffins, although — even according to his idea of the communist order of things — they "own" the "supreme owner". — His benevolent proposal to the communists — "to transform the word 'Lump' into an honourable form of address, just as the revolution did with the word 'citizen' " — is a striking example of how he confuses communism with something which long ago passed away. The revolution even "transformed" the word sansculotte "into an honourable form of address", as against "*honnêtes gens",* which he translates very inadequately as good citizens. Saint Sancho does this in order that there may be fulfilled the words in the book of the prophet Merlin about the three thousand and three hundred slaps which the man who is to come will have to give himself:

Needful it is that your squire, Sancho Panza,

Shall deal himself three thousand and three hundred

Lashes upon his two most ample buttocks,

Both to the air exposed, and in such sort

That they shall smart, and sting and vex him sorely.

(Don Quixote, Vol. If, Ch. 35.)

Saint Sancho notes that the "elevation of society to supreme owner" is a "second *robbery* of the personal element in the interests of humanity", while communism is only the completed robbery of the "robbery of the personal element". "Since he unquestionably regards robbery as detestable", Saint Sancho "therefore believes for example" that he "has branded" communism "already by the" above "proposition" ("the book", p. 102). "Once" "Stirner" has "detected" "even robbery" in communism, "how could he fail to feel profound disgust' at it and 'just indignation"'! (*Wigand*, p. 156.) We now challenge "Stirner" to name a bourgeois who has written about communism (or Chartism) and has not put forward the same absurdity with great emphasis. Communism will certainly carry out "robbery" of what the bourgeois regards as "personal". *First corollary.*

Page 349: "Liberalism at once came forward with the statement that it is an essential feature of man to be not property, but property-owner. Since it was a question here of man, and not of an individual, the question of how much, which was precisely what constituted the particular interest of individuals, was left to their discretion. Therefore, the egoism of individuals had the widest scope as regards this how much and carried on tireless competition."

That is to say: liberalism, i.e., liberal private property-owners, at the beginning of the French Revolution gave private property a liberal appearance by declaring it one of the rights of man. They were forced to do so if only because of their position as a revolutionising party; they were even compelled not only to give the mass of the French [rural] population the right to property, [but also] to let them *seize actual* property, and they could do all this because thereby their own "how much", which was what chiefly interested them, remained intact and was even made safe.

We find here further that Saint Max makes competition arise from liberalism, a slap that he gives history in revenge for the slaps which he had to give himself above. A "more exact explanation" of the manifesto with which he makes liberalism "*at once* come forward" can be found in Hegel, who in 1820 expressed himself as follows:

"In respect of external things it is rational" (i.e., it becomes me as reason, as a man) "that I should possess property ... what and how much I possess is, therefore, legally a matter of chance" (Rechtsphilosophie, § 49).

It is characteristic of Hegel that he turns the phrase of the bourgeois into the true concept, into the essence of property, and "Stirner" faithfully imitates him. On the basis of the above analysis, Saint Max now makes the further statement, that communism

raised the question as to how much property, and answered it in the sense that man should have as much as he needs. Can my egoism be satisfied with that?... No. I must rather have as much as I am capable of appropriating" (p. 349).

First of all it should be remarked here that communism has by no means originated from § 49 of Hegel's *Rechtsphilosophie* and its "what and how much". Secondly, "communism" does not dream of wanting to give anything to "man", for "communism" is not at all of the opinion that "man" 1I needs" anything apart from a brief critical elucidation. Thirdly, Stirner foists on to communism the conception of "need" held by the present-day bourgeois; hence he introduces a distinction which, on account of its paltriness, can be of importance only in present-day society and its ideal copy — Stirner's union of "individual shouters" and free seamstresses. "Stirner" has again achieved great "penetration" into the essence of communism. Finally, in his demand to have as much as he is capable of appropriating (if this is not the usual bourgeois phrase that everyone should have as much as his ability [The German word Vermögen used several times in this passage means not only ability, capability but also wealth, fortune, means, property; the authors here play on the various meanings of the word] permits him, that everyone should have the right of free gain), Saint Sancho assumes communism as having already been achieved in order to be able freely to develop his "ability" and put it into operation, which by no means depends solely on him, any more than his fortune itself, but depends also on the relations of production and intercourse in which he lives. (Cf. the chapter on the "Union" b) Incidentally, even Saint Max himself does not behave according to his doctrine, for throughout his "book" he "needs" things and uses things which he was not "capable of appropriating". *Second corollary.*

"But the social reformers preach a social law to us. The individual thus becomes the slave of society" (p. 246). "in the opinion of the communists, everyone should enjoy the eternal rights of man" (p. 238).

Concerning the expressions “law”, “labour”, etc., how they are used by proletarian writers . and what should be the attitude of criticism towards them, we shall speak in connection with “True Socialism” (see Volume 11). As far as law is concerned, we with many others have stressed the opposition of communism to law, both political and private, as also in its most general form as the rights of man. See the *Deutsch-Französische Jahrbücher*, where privilege, the special right, is considered as. something corresponding to private property inseparable from social classes, and law as something corresponding to the state of competition, of free private property (p. 206 and elsewhere); equally, the rights of man themselves are considered as privilege, and private property as monopoly. Further, criticism of law is brought into connection with German philosophy and presented as the consequence of criticism of religion (p. 72); further, it is expressly stated that the legal axioms that are supposed to lead to communism are axioms of private property, and the right of common ownership is an imaginary premise of the right of private property (pp. 98, 99). Incidentally, even in the works of German communists passages appeared very early — e.g., in the writings of Hess, *Einundzwanzig Bogen aus der Schweiz*, 1843, p. 326 and elsewhere — which could be appropriated and distorted — “by Stirner” in his criticism of law. Incidentally, the idea of using the phrase quoted above against Babeuf, of regarding him as the theoretical representative of communism could only occur to a Berlin school-master. “Stirner”, however, has the effrontery to assert on page 247 that

> ***communism, which assumes “that all people by nature have equal rights, refutes its own thesis and asserts that people by nature have no rights at all. For it does not want, for example, to admit that parents have rights in relation to their children; it abolishes the family. in general, this whole revolutionary or Babouvist principle (compare Die Kommunisten in der Schweiz, Kommissionalbericht, p. 3) is based on a religious, i.e., false, outlook”.***

A Yankee comes to England, where he is prevented by a justice of the Peace from flogging his slave, and he exclaims indignantly: “Do you call this a land of liberty, where a man can’t larrup his nigger? ,d Saint Sancho here makes himself doubly ridiculous. Firstly, he sees an abolition of the “equal rights of man” in the recognition of the “equal rights by nature” of children in relation to parents, in the granting of *the same* rights of man to children as well as to parents. Secondly, two pages previously Jacques le bonhomme tells us that the state does not interfere when a father beats his son, because it recognises family rights. Thus, what he presents, on the one hand, as a particular right (family right), he includes, on the other hand, among the “equal rights of man by nature”. Finally, he admits that he knows Babeuf only from the Bluntschli report, while this report (p. 3), in turn, admits that its wisdom is derived from the worthy L. Stein, [Lorenz von Stein, Der Socialismus und Communismus des heutigen Frankreichs] Doctor of Law. Saint Sancho’s thorough knowledge of communism is evident from this quotation. just as Saint Bruno is his broker as regards revolution, so Saint Bluntschli is his broker as regards communists. With such a state of affairs we ought not to be surprised that a few lines lower down our rustic word of God reduces the *fraternité* of the revolution to "equality of the children of God" (in what Christian dogma is there any talk of *égalité*?). *Third corollary*.

Page 414: Because the principle of community culminates in communism, therefore, communism = "apotheosis of the state founded on love".

From the state founded on love, which is Saint Max's own fabrication, he here derives communism which then, of course, remains an exclusively Stirnerian communism. Saint Sancho knows only egoism on the one hand or the claim to the loving services, pity and aims of people on the other hand. Outside and above this dilemma nothing exists for him at all. *Third logical construction*.

"Since the most oppressive evils are to be observed in society, it is especially" (!) "the oppressed" (!) who "think that the blame is to be found in society and set themselves the task of discovering the right society" (p. 155).

On the contrary, it is "Stirner" who "sets himself the task" of discovering the "society" which is "right" for him, the holy society, the society as the incarnation of the holy. Those who are ,oppressed" nowadays "in society", "think" only about how to achieve the society which is *right for them*, and this consists primarily in abolishing the present society on the basis of the existing productive forces. If, e.g., "oppressive evils are to be observed" in a machine, if, for example, it refuses to work, and those who need the machine (for example, in order to make money) find the fault in the machine and try to alter it, etc. — then, in Saint Sancho's opinion, they are setting themselves the task not of putting the machine right, but of discovering the right machine, the holy machine, the machine as the incarnation of the holy, the holy as a machine, the machine in the heavens. "Stirner" advises them to seek the blame "*in themselves". Is* it not their fault that, for example, they need a hoe and a plough? Could they not use their bare hands to plant potatoes and to extract them from the soil afterwards? The saint, on page 156, preaches to them as follows:

"It is merely an ancient phenomenon that one seeks first of all to lay the blame anywhere but on oneself — and therefore on the state, on the selfishness of the rich, for which, however, we ourselves are to blame."

The "oppressed" who seeks to lay the "blame" for pauperism on the "state" is, as we have noted above, no other than Jacques le bonhomme himself. Secondly, the "oppressed" who comforts himself by causing the "blame" to be laid on the "selfishness of the rich" is again no other than Jacques le bonhomme. He could have learned something better about the other oppressed from the *Facts and Fictions* of John Watts a tailor and doctor of philosophy, from Hobson's *Poor Man's Companion*, etc. And, thirdly, who is the person that should bear the "blame"? Is it, perhaps, the proletarian child who comes into the world tainted with scrofula, who is reared with the help of opium and is sent into the factory when seven years old — or is it, perhaps, the individual worker who is here expected to "revolt" by himself against the world market — or is it, perhaps, the girl who must either starve or become a prostitute? No, not these but only he who seeks "all the blame", i.e., the "blame" for everything in the present state of the world, "in himself", viz., once again no other than Jacques le bonhomme himself. "This is merely the ancient phenomenon" of Christian heart-searching and doing penitence in a German-speculative form, with its idealist phraseology, according to which 1, the actual man, do not have to change actuality, which I can only change together with others, but have to change myself in myself. "It is the internal struggle of the writer with himself" *(Die heilige Familie*, p. 122, cf. pp. 73, 121 and 306) According to Saint Sancho, therefore, those oppressed by society seek the right society. If he were consistent, he should make those who "seek to lay the blame on the state" — and according to him they are *the very same* people — also seek the *right state.* But he cannot do this, because he has heard that the communists want to abolish the state. He has now to construct this abolition of the state, and our Saint Sancho once more achieves this with the aid of his "ass", the apposition, in a way that "looks very simple":

"Since the workers are in a state of distress" [Notstand], "the existing state of affairs" [Stand der Dinge], "i.e., the state" [Staat] (status = state or estate) "must be abolished" (ibid.).

Thus:

the state of distress = the existing state of affairs

the existing state of affairs = state or estate

state, estate = *status*

status = the State

Conclusion: the state of distress = the State.

What could "look simpler"? "It is only surprising" that the English bourgeois in 1688 and the French in 1789 did not "put forward" the same "simple reflections" and equations, since in those times it was much more the case that estate = status = the State. It follows from this that wherever a "state of distress" exists, "the State", which is, of course, the same in Prussia and North America, must be abolished.

As is his custom, Saint Sancho now presents us with a few proverbs of Solomon.

Proverb of Solomon No. 1

Page 163: "That society is no ego, which could give, etc., but an instrument from which we can derive benefit; that we have no social duties, but only interests; that we do not owe any sacrifices to society, but if we do sacrifice something we sacrifice it for ourselves — all this is disregarded by the social [liberals], because they are in — thrall to the religious principle and are zealously striving for a — holy society."

The following "penetrations" into the essence of communism result from this:

1. Saint Sancho has quite forgotten that it was he himself who transformed "society" into an "ego" and that consequently he finds himself only in his own "society".

2. He believes that the communists are only waiting for "society" to "give" them something, whereas at most they want to give themselves a society.

3. He transforms society, even before it exists, into an instrument from which he wants to derive benefit, without him and other people by their mutual social relations creating a society, and hence this "instrument".

4. He believes that in communist society there can be a question of "duties" and "interests", of two complementary aspects of an antithesis which exists only in bourgeois society (under the guise of interest the reflecting bourgeois always inserts a third thing between himself and his mode of action — a habit seen in truly classic form in Bentham, whose nose had to have some interest before it would decide to smell anything. Compare "the book" on the right to one's nose, page 247).

5. Saint Max believes that the communists want to "make sacrifices" for "society", when they want at most to sacrifice existing society; in this case he should describe their consciousness that their struggle is the common cause of all people who have outgrown the bourgeois system as a sacrifice that they make to themselves.

6. That the social [liberals] are in thrall to the religious principle and

7. that they are striving for a holy society — these points have already been dealt with above. How "zealously" Saint Sancho "strives" for a "holy society", so as to be able to refute communism by means of it, we have already seen.

Proverb of Solomon No. 2.

Page 277: "If interest in the social problem were less passionate and blind, then one ... would understand that a society cannot be turned into a new one so long as those of whom it consists and who constitute it remain as of old,"

"Stirner" believes that the communist proletarians who revolutionise society and put the relations of production and the form of intercourse on a new basis — i.e., on themselves as new people, on their new mode of life — that these proletarians remain "as of old". The tireless propaganda carried on by these proletarians, their daily discussions among themselves, sufficiently prove how little they themselves want to remain "as of old", and how little they want people to remain "as of old". They would only remain "as of old" if, with Saint Sancho, they "sought the blame in themselves"; but they know too well that only under changed circumstances will they cease to be "as of old", and therefore they are determined to change these circumstances at the first opportunity. In revolutionary activity the changing of oneself coincides with the changing of circumstances. — This great saying is explained by means of an equally great example which, of course, is again taken from the world of "the holy".

"If, for example, the Jewish people was to give rise to a society which spread a new faith throughout the world, then these apostles could not remain Pharisees."

The first Christians = a society for spreading faith (founded anno 1).

— *Congregatio de propaganda fide* [25]

(founded anno 1640).

Anno 1 =Anno 1640.

This society which should arise = These apostles.

These apostles = Non-Jews.

The Jewish people = Pharisees.

Christians = Non-Pharisees.

= Not the Jewish people.

What can look simpler?

Reinforced by these equations, Saint Max calmly utters the great historic words [paraphrase of line from Goethe's Iphigenie auf Tauris]:

"Human beings, by no means intending to achieve their own development, have always wanted to form a society.".

Human beings, by no means wanting to form a society, have, nevertheless, only achieved the development of society, because they have always wanted to develop only as isolated individuals and therefore achieved their own development only in and through society. Incidentally it would only occur to a saint of the type of our Sancho to separate the development of "human beings" from the development of the "society" in which they live, and then let his fantasy roam on this fantastic basis. Incidentally, he has forgotten his own proposition, inspired by Saint Bruno, in which just previously he set people the moral demand of changing themselves and thereby changing their society — a proposition, therefore, in which he identifies the development of people with the development of their society.

Fourth logical construction.

On page 156 he makes the communists say, in opposition to the citizens:

"Our essence" (!) "does not consist in all of us being equal children of the state" (!) "but in that we all exist for one another. We are all equal in that we all exist for one another, that each works for the other, that each of us is a worker." He then regards ',to exist as a worker" as equivalent to "each of us exists only through the other", so that the other, "for example, works to clothe me, and I to satisfy his need of entertainment, he for my food and I for his instruction. Hence participation in labour is our dignity and our equality.

"What advantage do we derive from citizenship? Burdens. And what value is put on our labour? The lowest possible What can you put against us? Again, only labour!" "Only for labour do we owe you a recompense"; "only for what you do that is useful to us" "have You any claim on us". "We want to be only worth so much to you as we perform for you; but you should be valued by us in just the same way." "Deeds which are of some value to us, i.e., work beneficial to the community, determine value.... He who does something useful takes second place to no one, or — all workers (beneficial to the community) are equal. Since however the worker is worthy of his wage, then let the wage also be equal" (pp. 157,158).

With "Stirner", "communism" begins with searchings for "*essence";* being a good "youth" he wants again only to " penetrate behind things". That communism 's a highly practical movement, pursuing practical aims by practical means, and that only perhaps in Germany, in opposing the German philosophers, can it spare a moment for the problem of "essence" — this, of course, is of no concern to our saint. This Stirnerian "communism", which yearns so much for "essence", arrives, therefore, only at a philosophical category, i.e., "being-for-one-another", which then by means of a few arbitrary equations:

Being-for-one-another = to exist *only* through another

= to exist as a worker

= universal community of workers

is brought somewhat closer to the empirical world. We would, moreover, challenge Saint Sancho to indicate, for example, in Owen (who, after all, as a representative of English communism can serve as an example of "communism" just as well as, for example, the non-communist Proudhon, [Proudhon, who was as early as 1841 strongly criticised by the communist workers' journal *La Fraternité* for advocating equal wages, community of workers in general and also the other economic prejudices which can be found in the works of this outstanding writer; Proudhon, from whom the communists have accepted nothing but his criticism of property, ... unfinished note] from whom the greater part of the above propositions were abstracted and then rearranged) a passage containing anything of these propositions about "essence", universal community of workers, etc. Incidentally we do not even have to go so far back. The third issue of *Die Stimme des Volks,* the German communist magazine already quoted above, says:

"What is today called labour is only a miserably small part of the vast, mighty process of production; for religion and morality honour with the name of labour only the kind of production that is repulsive and dangerous, and in addition they venture to embellish such labour with all kinds of maxims — as it were words of blessing (or witchcraft) — 'labour in the sweat of thy brow' as a test imposed by God; 'labour sweetens life' for encouragement, etc. The morality of the world in which we live takes very good care not to apply the term work to the pleasing and free aspects of human intercourse. These aspects are reviled by morality, although they too constitute production. morality eagerly reviles them as vanity, vain pleasure, sensuality. Communism has exposed this hypocritical preaching, this miserable morality."

As universal community of workers, Saint Max reduces the whole of communism to equal wages — a discover which is then repeated in the following three "refractions": on page 351, "Against competition there rises the principle of the society of ragamuffins — *distribution.* Is it possible then that I, who am very *resourceful*, should have no advantage over one who is resourceless?" Further, on page 363, he speaks of a "universal tax on human activity in communist society". And, finally, on page 350, he ascribes to the communists the view that "labour" is "the only resource" of man. Thus, Saint Max re-introduces into communism private property in its dual form — as distribution and wage-labour. As before in connection with "robbery", Saint Max here again displays the most ordinary and narrow-minded bourgeois views as "his own" "penetrations" into the essence of communism. He shows himself fully worthy of the honour of having been taught by Bluntschli. As a real petty bourgeois, he is then afraid that he, "who is very resourceful", "should have no advantage over one who is resourceless" — although he should fear nothing so much as being left to his own "resources".

Incidentally, he "who is very resourceful" imagines that citizenship is a matter of indifference to the proletarians, after he has first assumed that they *have* it. This is just as he imagined above that for the bourgeoisie the form of government is a matter of in difference. The workers attach so much importance to citizenship, i.e., to *active* citizenship, that where they *have* it, for instance in America, they make good use" of it, and where they do not have it, they strive to obtain it. Compare the proceedings of the North American workers at innumerable meetings, the whole history of English Chartism, and of French communism and reformism. [26]

First corollary.

"The worker, being conscious that the essential thing about him is that he is a worker, keeps himself away from egoism and subordinates himself to the supremacy of a society of workers, just as the bourgeois adhered with devotion" (!) "to the state based on competition" (p. 162).

The worker' is at most conscious that for the bourgeois the essential thing about him is that he is a worker, who, therefore, can assert himself against the bourgeois as such. Both these discoveries of Saint Sancho, the "devotion of the bourgeois" and the "*state* based on competition", can be recorded only as fresh proofs of the resourcefulness" of the "very resourceful" man. *Second corollary.*

"The aim of communism is supposed to be the 'well-being of all'. This indeed really looks as though in this way no one need be in an inferior position. But what sort of well-being will this be? Have all one and the same well-being? Do all people feel equally well in one and the same circumstances?... If that is so, then it is a matter of 'true well-being'. Do we not thereby arrive precisely at the point where the tyranny of religion begins?... Society has decreed that a particular sort of well-being is 'true well-being', and if this well-being were, for example, honestly earned enjoyment, but you preferred enjoyable idleness, then society ... would prudently refrain from making provision for what is for you well-being. By proclaiming the well-being of all, communism destroys the well-being of those who up to now have lived as rentiers", etc. (pp. 411. 412).

"If that is so", the following equations result from it:

The well-being of all = Communism

= If that is so

= One and the same well-being of all

= Equal well-being of all in one and the same circumstances

= True well-being

= [Holy well-being, the holy, the rule of the holy, hierarchy]

= Tyranny of religion.

Communism = Tyranny of religion.

"This indeed really looks as though" "Stirner" has said the same thing about communism as he has said previously about everything else.

How deeply our saint has "penetrated" into the essence of communism is evident also from the fact that he ascribes to communism the desire to bring about "true well-being" in the shape of "honestly earned enjoyment". Who, except "Stirner" and a few Berlin cobblers and tailors, thinks of "honestly earned enjoyment"!

And, what is more, to put this into the mouth of communists, for whom the basis of this whole opposition between work and enjoyment disappears. Let our highly moral saint put his mind at rest on this score. "Honest earning" will be left to him and those whom, unknown to himself, he represents — his petty handicraftsmen who have been ruined by industrial freedom and are morally indignant". "Enjoyable idleness", too, belongs wholly to the most trivial bourgeois outlook. But the crowning point of the whole statement is the artful bourgeois scruple that he raises against the communists: that they want to abolish the "well-being" of the rentier and yet talk about the "well-being of all". Consequently, he believes that in communist society there will still be rentiers, whose "well-being" would have to be abolished. He asserts that "wellbeing" *as rentier* is inherent in the individuals who are at present rentiers, that it is inseparable from their individuality, and he imagines that for these individuals there can exist no other "wellbeing" than that which is determined by their position as rentiers.

He believes further that a society which has still to wage a struggle against rentiers and the like, is already organised in a communist way. The communists, at any rate, will have no scruples about overthrowing the rule of the bourgeoisie and abolishing its "wellbeing", as soon as they are strong enough to do so. It does not matter to them at all whether this "well-being" common to their enemies and determined by class relations also appeals as personal "well-being" to a sentimentality which is narrow-mindedly presumed to exist.

Third corollary.

On page 190, in communist society

" ***Worry arises again in the form of labour".***

The good citizen "Stirner", who is already rejoicing that he will again find his beloved "worry" 'n communism, has nevertheless miscalculated this time. "Worry" 's nothing but the mood of oppression and anxiety which in the middle class is the necessary companion of labour, of beggarly activity for securing scanty earnings. "Worry" flourishes in its purest form among the German good burghers, where it is chronic and "always identical with itself", miserable and contemptible, whereas the poverty of the proletarian assumes an acute, sharp form, drives him into a life-and-death struggle, makes him a revolutionary, and therefore engenders not "worry", but passion. If then communism wants to abolish both the "worry" of the burgher and the poverty of the proletarian, it goes without saying that it cannot do this without abolishing the cause of both, i.e., "labour".

We now come to the *historical constructions* of communism.

First historical construction.

"So long as faith was sufficient for the honour and dignity of man, no objection could be raised against any, even the most arduous labour.... The oppressed classes existing social classes. could tolerate their misery only so long as they were Christians" (the most that can be said is that they were Christians so long as they tolerated their miserable position), "for Christianity" (which stands behind them with a stick) "keeps their grumbling and indignation in check" (p. 158).

"How 'Stirner' knows so well" what the oppressed classes could do, we learn from the first issue of the *Allgemeine Literatur-Zeitung*, where "criticism in the form of a master-bookbinder" quotes the following passage from an unimportant book. [from August Theodor Woeniger's book Publicistische Abhandlungen, quoted by Carl Ernst Reichardt — "the master-bookbinder" — in his article "Schriften über den Pauperismus"]

"Modern pauperism has assumed a political character; whereas formerly the beggar bore his fate submissively and regarded it as God's will, the modern ragamuffin asks whether he is forced to drag out his life in poverty just because he chanced to be born in rags."

It was due to this power of Christianity that during the liberation of the feudal serfs the most bloody and embittered struggles were precisely those against the *spiritual* feudal lords, and it was carried through despite all the grumbling and indignation of Christianity as embodied in the priests (cf. Eden, *History of the Poor,* Book I; Guizot, *Histoire de la civilisation en France;* Monteil, *Histoire des français des divers états,* etc.), while, on the other hand, the minor priests, particularly at the beginning of the Middle Ages, incited the feudal serfs to "grumbling" and "Indignation" against the temporal feudal lords (cf., *inter alia,* even the well-known capitulary of Charlemagne[27]). Compare also what was written above in connection with the "workers' disturbances which flared up here and there", about the "oppressed classes" and their revolts in the fourteenth century.' The earlier forms of workers' uprisings were connected with the degree of development of labour in each case and the resulting form of property; direct or indirect communist uprisings were connected with large-scale industry. Instead of going into this extensive history, Saint Max accomplishes a holy transition from the *patient* oppressed classes to the *impatient* oppressed classes:

"Now, when everyone ought to develop into a man" ("how," for example, do the Catalonian workers [28] "know" that "everyone ought to develop into a man"?), "the confining of man to machine labour amounts to slavery" (p. 158).

Hence, prior to Spartacus and the uprising of the slaves, it was Christianity that prevented the "confining of man to machine labour" from "amounting to slavery"; and in the days of Spartacus it was only the concept of "man" that removed this relation and brought about slavery. "Or did" Stirner "perhaps" "even" hear something about the connection between modern labour unrest and machine production and wanted here to give an intimation of this? In that case it was not the introduction of machine labour that transformed the workers into rebels, but the introduction of the concept of "man" that transformed machine labour into slavery. — "If that is so" then "it indeed really looks as though" we have here a "unique" history of the workers' movements. *Second historical construction.*

"The bourgeoisie has preached the gospel of material enjoyment and is now surprised that this doctrine finds supporters among us proletarians" (p. 159).

Just now the workers wanted to realise the concept of "man", the holy; now it is "material enjoyment", the worldly; above it was a question of the "drudgery" of labour, now it is only the labour of enjoyment. Saint Sancho strikes himself here on *ambas sus valientes posaderasa* [his two most ample buttocks] — first of all on material history, and then on Stirner's, holy history. According to material history, it was the aristocracy that first put the gospel of worldly enjoyment in the place of enjoyment of the gospel; it was at first for the aristocracy that the sober bourgeois' ie applied itself to work and it very cunningly left to the aristocracy the enjoyment from which it was debarred by its own laws (whereby the power of the aristocracy passed i . n the form of money into the pockets of the bourgeoisie).

According to Stirner's history, the bourgeoisie was satisfied to seek "the holy", to pursue the cult of the state and to "transform all existing objects into imaginary ones", and it required the Jesuits to "save sensuousness from complete decay". According to this same Stirnerian history, the bourgeoisie usurped all power by means of revolution, consequently also its gospel, that of material enjoyment, although according to the same Stirnerian history we have now reached the point where "ideas alone rule the world". Stirner's hierarchy thus finds itself "*entre ambas posaderas*".

Third historical construction.

Page 159: "After the bourgeois had given freedom from the commands and arbitrariness of individuals, there remained the arbitrariness which arises from the conjuncture of conditions and which can be called the fortuitousness of circumstances. There remained — luck and those favoured by luck."

Saint Sancho then makes the communists "find a law and a new order which puts an end to these fluctuations" (the thingumbob), about which order he knows this much, that the communists should now proclaim: "Let this order henceforth be holy!" (whereas he ought now rather to have proclaimed: Let the disorder of my fantasies be the holy order of the communists). "Here is wisdom' (Revelation of St. John, 13: 18). "Let him that bath understanding count the number" of absurdities which Stirner — usually so verbose and always repeating himself — [here] squeezes into a few [lines].

In its most general form the first proposition reads: after the bourgeoisie had abolished feudalism, the bourgeoisie remained. Or: after the domination of individuals had been abolished in "Stirner's" imagination, precisely the opposite remained to be done. "It indeed really looks as though" one could bring the two most distant historical epochs into a relationship which is the holy relationship, the relationship as the holy, the relationship in heaven.

Incidentally, this proposition of Saint Sancho's is not satisfied with the above-mentioned *mode simple* of absurdity, it has to bring it to the *,mode composé and bicomposé* [terms used by Fourier] of absurdity. For, firstly, Saint Max believes the bourgeoisie which liberates *itself* that, by liberating *itself* from the commands and arbitrariness of individuals, it has liberated the mass of society as a whole from the commands and arbitrariness of individuals. Secondly, in reality it liberated itself not from the "commands and arbitrariness of individuals", but from the domination of the corporation, the guild, the estates, and hence was now for the first time, as *actual* individual bourgeois, in a position to impose "commands and arbitrariness" on the workers. Thirdly, it only abolished the more or less idealistic appearance of the former commands and former arbitrariness of individuals, in order to establish instead these commands and this arbitrariness in their material crudity. He, the bourgeois, wanted his "commands and arbitrariness" to be no longer restricted by the hitherto existing "commands and arbitrariness" of political power concentrated in the monarch, the nobility and the corporations, but at most restricted only by the general interests of the whole bourgeois class, as expressed in bourgeois legislation. He did nothing more than abolish the commands and arbitrariness over the commands and arbitrariness of the individual bourgeois (see "Political Liberalism").

Instead of making a real analysis of the conjuncture of conditions, which with the rule of the bourgeoisie became a totally different conjuncture of totally different conditions, Saint Sancho leaves it in the form of the general category "conjuncture, etc.", and bestows on it the still more indefinite name of "fortuitousness of circumstances", as though the "commands and arbitrariness of individuals" are not themselves a "conjuncture of conditions". Having thus done away with the real basis of communism, i.e., the *definite* conjuncture of conditions under the bourgeois regime, he can now also transform this airy communism into his holy communism. "It indeed really looks" as though "Stirner" is a "man with only ideal", imagined, historical "wealth" — the "*perfect ragamuffin*". See "the book", p. 362.

This great construction or, rather, its major proposition is once more and with great emphasis repeated on page 189 in the following form:

"Political liberalism abolished the inequality of master and servant; it made people masterless, anarchic" (!); "the master was then separated from the individual, from the egoist, to become a spectre, the law or the state."

Domination of spectres = (hierarchy) = absence of domination equivalent to the domination of the "omnipotent" bourgeois. As we see, this domination of spectres is, on the contrary, the domination of the many actual masters; hence with equal justification communism could be regarded as liberation from this domination of the many. This, however, Saint Sancho could riot do, for then not only his logical constructions of communism but also the whole construction of "the free ones" would be overthrown. But this is how it is throughout "the book". A single conclusion from our saint's own premises, a single historical fact, overthrows the entire series of penetrations and results.

Fourth historical construction. On page 350, Saint Sancho derives communism directly from the abolition of serfdom.

I. *Major proposition*:

"Extremely much was gained when people succeeded in being regarded" (!) "as property-owners. Thereby serfdom was abolished and everyone who until then had himself been property henceforth became a master."

(According to the *mode simple* of absurdity this means: serfdom was abolished as soon as it was abolished.) The *mode composé* of this absurdity is that Saint Sancho believes that people became "property-owners" by means of holy contemplation, by means of "regarding" and "being regarded", whereas the difficulty consisted in becoming a "property-owner", and consideration came later of itself. The *mode bicomposé* of the absurdity is that when the abolition of serfdom, which at first was still partial, had begun to develop its consequences and thereby became universal, people ceased to be able to "succeed" in being "regarded" as *worth* owning (for the property-owners those they owned had become too expensive); consequently the vast mass "who until then had themselves been property" i.e., unfree workers, became as a result not "masters", but free workers. II. *Minor historical proposition*, which embraces about eight centuries, although one "will of course not perceive how momentous" it is (cf. *Wigand*, p. 194).

“However, henceforth your having [Dein Haben] and what you have [Deine Habe] no longer suffices, and is no longer recognised; on the other hand, your working and your work increases in value. We now respect your mastery of things as previously” (?) “we respected your possession of them. Your labour is your wealth. You are now the master or possessor of what you have obtained by work and not by inheritance” (ibid.).

“Henceforth” — “no longer” — “on the other hand” — “now” — “as previously” — “now” — “or” — “not” — such is the content of this proposition.

Although “Stirner” has “now” arrived at this, that you (viz., Szeliga) are the master of what you have obtained by work and not by inheritance, it “now” occurs to him that just the opposite is the case at present — and so he causes communism to be born as a monster from these two distorted propositions.

III. *Communist conclusion.*

“Since, however, now everything is inherited and every farthing you possess bears not the stamp of work, but of inheritance” (the culminating absurdity), “SO everything must be remoulded.”

On this basis Szeliga is able to imagine that he has arrived at both the rise and fall of the medieval communes, and the communism of the nineteenth century. And thereby Saint Max, despite everything “inherited” and “obtained by work”, does not arrive at any “mastery of things”, but at most at “having” nonsense.

Lovers of constructions can now see in addition on page 421 how Saint Max, after constructing communism from serfdom, then constructs it again in the form of serfdom *under* a liege lord — society — on the same model as he already, above, transformed the means by which we earn something into the “holy”, by “grace” of which something is given to us. Now, in conclusion, we shall deal in addition only with a few “penetrations” into the essence of Communism, which follow from the premises given above.

First of all, “Stirner” gives a new *theory of exploitation* which consists in this:

“the worker in a pin factory performs only one piece of work, only plays into the hand of another and is used. exploited by that other” (p. 158).

Thus, here “Stirner” makes the discovery that the workers in a factory exploit one another, since they “play into the hands” of one another; whereas the factory-owner, whose hands do not work at all, cannot, therefore, exploit the workers. “Stirner” here gives a striking example of the lamentable position in which communism has put the German theoreticians. Now they have to concern themselves also with mundane things like pin factories, etc., in relation to which they behave like real barbarians, like Ojibbeway Indians and New Zealanders. Stirnerian communism "on the contrary says" (ibid.):

"All work should have the aim of satisfying 'man'. Therefore, he" ("man") "must become master of it, i.e., be able to perform it as a totality."

"Man" must become a master! — "Man" remains a maker of pin-heads, but he has the consolation of knowing that the pin-head is part of the pin and that he *is able* to make the whole pin. The fatigue and disgust caused by the eternally repeated making of pin-heads is transformed, by this knowledge, into the "satisfaction of man". O Proudhon! A further penetration:

"Since communists declare that only free activity is the essence" (iterum Crispinus) "of man, they, like every workaday mode of thought, need a Sunday, a time of exaltation and devotion, in addition to their dull labour."

Apart from the "essence of man" that is dragged in here, the unfortunate Sancho is forced to convert "free activity", which is for the communists the creative manifestation of life arising from the free development of all abilities of the "whole fellow" (in order to make it comprehensible to "Stirner"), into "dull labour", for our Berliner notices that the question here is not one of the "hard work of thought". By this simple transformation the communists can now also be transposed into the "workaday mode of thought". Then, of course, together with the work-day of the middle-class its Sunday also is to be found again in communism.

Page 161: "The Sunday aspect of communism consists in the communist seeing in you the man, the brother."

Thus, the communist appears here as "man" and as "worker". This Saint Sancho calls (loc. cit.) "a dual *employment* of man by the communists — an office of material earning and one of spiritual earning".

Here, therefore, he brings back even "earning" and bureaucracy into communism which, of course, thereby "attains its final goal" and ceases to be communism. Incidentally he has to do this, because in his "union", which he will construct later, each also is given a "dual position" — as man and as the "unique". For the present he legitimises this dualism by foisting it on communism, a method we shall find again in his theory of feudalism and of utilisation.

On page 344 "Stirner" believes that the "communists" want to "settle the question of property amicably", and on page 413 he even makes them appeal to the self-sacrifice of people [and to] the self-denying disposition of the capitalists! The few non-revolutionary communist *bourgeois* who made their appearance since the time of Babeuf were a rare occurrence; the vast majority of the communists in all countries are revolutionary. All communists in France reproach the followers of Saint-Simon and Fourier with their peaceableness and differ from the latter chiefly in their having abandoned all hope of an "amicable settlement", just as in Britain it is the same criterion which chiefly distinguishes the Chartists from the socialists. Saint Max could discover the communist view of the "self-denying disposition of the rich" and the "self-sacrifice of people" from a few passages of Cabet, the very communist who most of all could give the impression that he appeals for *dévoûment*, self-sacrifice. These passages are aimed against the republicans and especially against the attacks on communism made by Monsieur Buchez, who still commands the following of a very small number of workers in Paris:

"The same thing applies to self-sacrifice (dévoûment); it is the doctrine of Monsieur Buchez, this time divested of its Catholic form, for Monsieur Buchez undoubtedly fears that his Catholicism is repugnant to the mass of the workers, and drives them away. 'In order to fulfil their duty (devoir) worthily' — says Buchez — 'self-sacrifice (dévoûment) is needed.' — Let those who can understand the difference between devoir and dévoûment. — 'We require self-sacrifice from everyone, both for great national unity and for the workers' association ... it is necessary for us to be united, always devoted (dévoûés) to one another.' — It is necessary, it is necessary — that is easy to say, and people have been saying it for a long time and they will go on saying it for a very long time yet without any more success, if they cannot devise other means! Buchez complains of the self-seeking of the rich; but what is the use of such complaints? All who are unwilling to sacrifice themselves Buchez declares to be enemies.

"'If,' he says, 'impelled by egoism, a man refuses to sacrifice himself for others, what is to be done?... We have not a moment's hesitation in answering: society always has the right to take from us what our own duty bids us sacrifice to it.... Self-sacrifice is the only means of fulfilling one's duty. Each one of us must sacrifice himself, always and everywhere. He who out of egoism refuses to fulfil his duty of self-sacrifice must be compelled to do it.' — Thus Buchez cries out to all: sacrifice yourselves, sacrifice yourselves! Think only of sacrificing yourselves! Does this not mean to misunderstand human nature and trample it underfoot? Is not this a false view? We might almost say — a childish, silly view" (Cabet, Réfutation des doctrines de l'Atelier, pp. 19, 20).

Cabet, further, on page 22, demonstrates to the republican Buchez that he inevitably arrives at an "aristocracy of self-sacrifice" with various ranks, and then asks ironically:

"What then becomes of dévoûment? What remains of dévoûment if people sacrifice themselves only in order to reach the highest pinnacles of hierarchy?... Such a system might originate in the mind of a man who would like to become

Pope or Cardinal — but in the minds of workers!!!" — "M. Buchez does not want labour to become a pleasant diversion, nor that man should work for his own well-being and create new pleasures for himself. He asserts ... 'that man exists on earth only to fulfil a calling, a duty (une fonction, un devoir)'. 'No,' he preaches to the communists, 'man, this great force, has not been created for himself (n'a point été fait Pour lui-même).... That is a crude idea. Man is a worker (ouvrier) in the world, he must accomplish the work (oeuvre) which morality imposes on his activity, that is his duty.... Let us never lose sight of the fact that we have to fulfil a high calling (une haute fonction) — a calling that began with the first day of man's existence and will come to an end only at the same time as humanity.' — But who revealed all these fine things to [M.] Buchez? (Mais qui a révélé toutes ces belles chases a M. Buchez lui-même" — which Stirner would have translated: How is it that Buchez knows so well what man should do?) — "Du reste, comprenne qui pourra. — Buchez continues: 'What! Man had to wait thousands of centuries in order to learn from you communists that he was created for himself and has no other aim than to live in all possible pleasures.... But one must not fall into such an error. One must not forget that we are created in order to labour (faits pour travailler), to labour always, and that the only thing we can demand is what is necessary for life (la suffisante vie), i.e., the well-being that suffices for us to carry out our calling properly. Everything that is beyond this boundary is absurd and dangerous.' — But just prove it, prove it! And do not be satisfied merely with delivering oracles like a prophet! At the very outset you speak of thousands of centuries! And then, who asserts that people have been waiting for us down all the centuries? But have people perhaps been waiting for you with all your theories about dévoûment, devoir, nationalité française, association ouvrière?' 'In conclusion,' says Buchez, 'we ask you not to take offence at what we have said.' — We also are polite Frenchmen and we, too, ask you not to take offence" (p. 31). — "'Believe us,' says Buchez, 'there exists a communauté which was created long ago and of which you too are members.' — Believe us, Buchez," concludes Cabet, "become a communist!"

"Self-sacrifice", "duty", "social obligation", "the right of society", "the calling, the destiny of man", "to be a worker the calling of man", "moral cause", "workers' association", "creation of what is indispensable for life" — are not these the same things for which Saint Sancho reproaches the communists, and for the *absence* of which the communists are reproached by M. Buchez, whose solemn reproaches are ridiculed by Cabet? Do we not find here even Stirner's "hierarchy"? Finally, Saint Sancho deals communism the *coup de grace* on page 169, by uttering the following proposition:

"By taking away also property" (!) "the socialists do not take into account that its continuance is safeguarded by the peculiarities of human beings. Are only

money and goods property, or is not every opinion also something that is mine, that belongs to me? Hence, every opinion must be abolished or made impersonal."

Or does Saint Sancho's opinion, insofar as it does not become the opinion of others as well, give him command over anything, even over another's opinion? By bringing into play against communism the capital of his opinion, Saint Max again does nothing but advance against it the oldest and most trivial bourgeois objections, and he thinks he has said something new because for him, the "educated" Berliner, these hackneyed ideas are new. Destutt de Tracy among, and after, many others said the same thing much better approximately thirty years ago, and also later, in the book quoted below. For example:

"Formal proceedings were instituted against property, and arguments were brought forward for and against it, as though it depended on us to decide whether property should or should not exist in the world; but this is based on a complete misunderstanding of our nature" (Traité de la volonté, Paris, 1826, p. 18).

And then M. Destutt de Tracy undertakes to prove that *propriété*, *individualité* and *personnalité* are identical, that the "ego" [*moi*] also includes "mine" [*mien*], and he finds as a natural basis for private property that

"nature has endowed man with an inevitable and inalienable property, property in the form of his own individuality" (p. 17). — The individual "clearly sees that this ego is the exclusive owner of the body which it animates, the organs which it sets in motion, all their capacities, all their forces, all the effects they produce, all their passions and actions; for all this ends and begins with this ego, exists only through it, is set in motion through its action; and no other person can make use of these same instruments or be affected in the same way by them" (p. 16). "Property exists, if not precisely, everywhere that a sentient individual exists, at least wherever there is a conative individual" (p. 19).

Having thus made private property and personality identical, Destutt de Tracy with a play on the words *propriété* and *propre*, like "Stirner" with his play on the words *Mein* and *Meinung*, *Eigentum* and *Eigenheit*, [one's own, my, mine; opinion, view; property; peculiarity] arrives at the following conclusion:

"It is, therefore, quite futile to argue about whether it would not be better for each of us to have nothing of our own (*de discuter s'il ne vaudrait pas mieux que rien ne fût propre à chacun de nous*) ... in any case it is equivalent to asking whether it would not be desirable for us to be quite different from what we are, and even to examining whether it would not be better for us not to exist at all" (p. 22).

"these are extremely popular", now already traditional objections to communism, and for that very reason "it is not surprising that Stirner" repeats them.

— Individuality and Property —

When the narrow-minded bourgeois says to the communists: by abolishing property, i.e., my existence as a capitalist, as a landed proprietor, as a factory-owner, and your existence as workers, you abolish my individuality and your own; by making it impossible for me to exploit you, the workers, to rake in my profit, interest or rent, you make it impossible for me to exist as an individual. — When, therefore, the bourgeois tells the communists: by abolishing my existence *as a bourgeois*, you abolish my existence *as an individual*; when thus he identifies himself as a bourgeois with himself as an individual, one must, at least, recognise his frankness and shamelessness. For the bourgeois it is actually the case, he believes himself to be an individual only insofar as he is a bourgeois.

But when the theoreticians of the bourgeoisie come forward and give a general expression to this assertion, when they equate the bourgeois's property with individuality in theory as well and want to give a logical justification for this equation, then this nonsense begins to become solemn and holy.

Above "Stirner" refuted the communist abolition of private property by first transforming private property into "having" and then declaring the verb "to have" an indispensable word, an eternal truth, because even in communist society it could happen that Stirner will "have" a stomach-ache. In exactly the same way here his arguments regarding the impossibility of abolishing private property depend on his transforming private property into the concept of property, on exploiting the etymological connection between the words *Eigentum* and *eigen* and declaring the word *eigen* an eternal truth, because even under the communist system it could happen that a stomach-ache will be *eigen* to him. All this theoretical nonsense, which seeks refuge in etymology, would be impossible if the actual private property that the communists want to abolish had not been transformed into the abstract notion of "property". This transformation, on the one hand, saves one the trouble of having to say anything, or even merely to know anything, about actual private property and, on the other hand, makes it easy to discover a contradiction in communism, since *after* the abolition of (*actual*) property it is, of course, easy to discover all sorts of things in communism which can be included in the concept "property". In reality, of course, the situation is just the reverse. In reality I possess private property only insofar as I have something vendible, whereas what is peculiar to me [*meine Eigenheit*] may not be vendible at all. My frock-coat is private property for me only so long as I can barter, pawn or sell it, so long [as it] is [marketable]. If it loses that feature, if it becomes tattered, it can still have a number of features which make it valuable for me, it may even become a feature of me and turn me into a tatterdemalion. But no economist would think of classing it as my private property, since it does not enable me to command any, even the smallest, amount of other people's labour. A lawyer, an ideologist of private property, could perhaps still indulge in such twaddle.

— Private Property and Alienation —

Private property alienates [*entfremdet*] the individuality not only of people but also of things. Land has nothing to do with rent of land, the machine has nothing to do with profit. For the landed proprietor, land has the significance only of rent of land; he leases his plots of land and receives rent; this is a feature which land can lose without losing a single one of its inherent features, without, for example, losing any part of its fertility; it is a feature the extent and even the existence of which depends on social relations which are created and destroyed without the assistance of individual landed proprietors. It is the same with machines. How little connection there is between money, the most general form of property, and personal peculiarity, how much they are directly opposed to each other was already known to Shakespeare ***better than to our theorising petty bourgeois:***

Thus much of this will make black, white; foul, fair;

Wrong, right; base, noble; old, young; coward, valiant.

This yellow slave...

Will make the hear leprosy adored...

This it is

That makes the wappened widow wed again;

She, whom the spital-house and ulcerous sores

Would cast the gorge at, this embalms and spices

To the April day again...

Thou visible god,

That solder'st close impossibilities,

And makest them kiss!"

[Shakespeare, Timon of Athens, Act IV, Scene 3]

In a word, rent of land, profit, etc., these actual forms of existence of private property, are *social relations* corresponding to a definite stage of production, and they are "*individual*" only so long as they have not become fetters on the existing productive forces.

According to Destutt de Tracy, the majority of people, the proletarians, must have lost all individuality long ago, although nowadays it looks as if it was precisely among them that individuality is most developed. For the bourgeois it is all the easier to prove on the basis of his language the identity of commercial and individual, or even universal, human relations, as this language itself is a product of the bourgeoisie, and therefore both in actuality and in language the relations of buying and selling have been made the basis of all others. For example, *propriété* — property [*Eigentum*] and characteristic feature [*Eigenschaft*]; property — possession [*Eigentum*] and peculiarity [*Eigentümlichkeit*]; "*eigen*" ["one's own"] — In the commercial and in the individual sense; *valeur*, value, *Wert*; commerce, *Verkehr*; *échange, exchange, Austausch*, etc., all of which are used both for commercial relations and for characteristic features and mutual relations of individuals as such. In the other modern languages this is equally the case. If Saint Max seriously applies himself to exploit this ambiguity, he may easily succeed in making a brilliant series of new economic discoveries, without knowing anything about political economy; for, indeed, his new economic facts, which we shall take note of later, lie wholly within this sphere of synonymy.

Our kindly, credulous Jacques takes the bourgeois play on the words *Eigentum* [property] and *Eigenschaft* [characteristic feature] so literally, in such holy earnest, that he even endeavours to behave like a private property-owner in relation to his own features, as we shall see later on.

Finally, on page 421, "Stirner" instructs communism that

"actually it" (viz., communism) "does not attack property, but the alienation of property".

In this new revelation of his, Saint Max merely repeats an old witticism already used repeatedly by, for example, the Saint-Simonists. Cf., for example, *Leçons sur l'industrie et les finances*, Paris, 1832, where, *inter alia*, it is stated:

"Property will not be abolished, but its form will be changed ... it will for the first time become true personification ... it will for the first time acquire its real, individual character" (pp. 42, 43).

Since this phrase, introduced by the French and particularly enlarged on by Pierre Leroux, was seized on with great pleasure by the German speculative socialists and used for further speculation, and finally gave occasion for reactionary intrigues and sharp practices — we shall not deal with it here where it says nothing, but later on, in connection with true socialism.

Saint Sancho, [following the] example of Woeniger, whom Reichardt [used], takes delight in turning the proletarians, [and hence] also the communists, into "*ragamuffins*". He defines his "ragamuffin" on page 362 as a "man possessing only ideal wealth". If Stirner's "ragamuffins" ever set up a vagabond kingdom, as the Paris beggars did in the fifteenth century, then Saint Sancho will be the vagabond king, for he is the "perfect" ragamuffin, a man possessing not even ideal wealth and therefore living on the interest from the capital of his opinion.

C. Humane Liberalism

After Saint Max has interpreted liberalism and communism as imperfect modes of existence of philosophical "man", and thereby also of modern German philosophy in general (which he was justified in doing, since in Germany not only liberalism but communism as well was given a petty-bourgeois and at the same time high-flown ideological form), after this, it is easy for him to depict the latest forms of German philosophy, what he has called "humane liberalism", as perfect liberalism and communism, and, at the same time, as criticism of both of them.

With the aid of this holy construction we now get the following three delightful transformations (cf. also "The Economy of the Old Testament"):

1. The individual *is* not man, therefore he is of no value — absence of personal will, ordinance — "whose name will be named": "masterless" — political liberalism, which we have already dealt with above.

2. The individual *has* nothing human, therefore no validity attaches to mine and thine or property: "propertyless" — communism, which we have also already dealt with.

3. In criticism the individual should give place to man, now found for the first time: "godless" = identity of "masterless" and "propertyless" — humane liberalism (pp. 180-81). — In a more detailed exposition of this last negative unity, the unshakeable orthodoxy of Jacques reaches the following climax (p. 189):

"The egoism of property loses its last possession if even the words 'my God' become meaningless, for" (a grand "for"!) "God only exists if he has at heart the salvation of each individual, just as the latter seeks his salvation in God."

According to this, the French bourgeois would only "lose" his "last" "Property" if the word *adieu* were banished from the language. In complete accord with the preceding construction, property in God, holy property in heaven, the property of fantasy, the fantasy of property, are here declared to be supreme property and the last sheet-anchor of property.

From these three illusions about liberalism, communism and German philosophy, he now concocts his new — and, thanks be to the "holy", this time the last — transition to the "*ego*". Before following him in this, let us once more glance at his last "arduous life struggle" with "humane liberalism".

After our worthy Sancho in his new role of *caballero andante* [knight-errant], and in fact as *caballero de la tristisima figura*, [knight of the most rueful countenance] has traversed the whole of history, everywhere battling and "blowing down" spirits and spectres, "dragons and ostriches, satyrs and hobgoblins, wild beasts of the desert and vultures, bitterns and hedgehogs" (cf. Isaiah, 34:11-14), how happy he must now be, after his wanderings through all these different lands, to come at last to his island of Barataria [29] to "the land" as such, where "Man" goes about in *puris naturalibus* [in the pure natural state]! Let us once more recall his great thesis, the dogma imposed on him, on which his whole construction of history rests, to the effect that:

"the truths which arise from the concept of man are revered as revelations of precisely this concept and regarded as holy"; "the revelations of this holy concept", even "with the abolition of many a truth manifested by means of this concept, are not deprived of their holiness" (p. 51).

We need hardly repeat what we have already proved to our holy author in respect of all his examples, namely, that empirical relations, created by real people in their real intercourse and not at all by the holy concept of man, are afterwards interpreted, portrayed, imagined, consolidated and justified by people as a revelation of the concept "man". One may also recall his hierarchy. And now on to humane liberalism. On page 44, where Saint Max "in brief" "contrasts Feuerbach's [theological] view with our view", at first nothing but phrases are advanced against Feuerbach. As we already saw in regard to the manufacture of spirits, where "Stirner" places his stomach among the stars (the third Dioscuros, a patron saint and protector against seasickness [30]), because he and his stomach are "different names for totally different things" (p. 42), so, here, too, essence [*Wesen*] appears first of all as an existing thing, and "so it is now said" (p. 44):

"The supreme being is, indeed, the essence of man, but precisely because it is his essence, and not man himself, it makes absolutely no difference whether we see this essence outside man and perceive it as 'God' or find it in man and call it the 'essence of man' or 'Man'. I am neither God nor Man, neither the supreme being nor my essence — and, therefore, in the main, it makes no difference whether I think of this essence as inside me or outside me."

Hence, the "essence of man" is presupposed here as an existing thing, it is the "supreme being", it is not the "ego", and, instead of saying something about "essence", Saint Max restricts himself to the simple statement that it makes "no difference" "whether I *think* of it as inside me or outside me", in this locality or in that. That this indifference to essence is no mere carelessness of style is already evident from the fact that he himself makes the distinction between essential and inessential and that with him even "the *noble essence of* egoism" finds a place (p. 71). Incidentally everything the German theoreticians have said so far about essence and non-essence is to be found already far better said by Hegel in his *Logik*. We found the boundless orthodoxy of "Stirner" with regard to the illusions of German philosophy expressed in concentrated form in the fact that he constantly foists "Man" on history as the sole *dramatis persona* and believes that "Man" has made history. Now we shall find the same thing recurring in connection with Feuerbach, whose illusions "Stirner" faithfully accepts in order to build further on their foundation.

Page 77: "In general Feuerbach only transposes subject and predicate, giving preference to the latter. But since he says himself: 'Love is not holy because it is a predicate of God (nor have people ever held it to be holy for that reason) but it is a predicate of God because it is divine by and for itself,' he was able to conclude that the struggle had to be begun against the predicates themselves, against love and everything holy. How could he hope to turn people away from God, once he had left them the divine? And if, as Feuerbach says, the main thing for people has never been God, but only his predicates, he could after all have allowed them to keep this tinsel, since the puppet, the real kernel, still remained."

Since, therefore, Feuerbach "*himself*" says this, it is reason enough for Jacques le bonhomme to *believe* him that people have esteemed love because it is "divine by and for itself ". If precisely the *opposite* of what Feuerbach says took place — and we "make bold to say this" (*Wigand*, p. 157) — if neither God nor his predicates have ever been the main thing for people, if this itself is only a religious illusion of German theory — it means that the very same thing has happened to our Sancho as happened to him before in Cervantes, when four stumps were put under his saddle while he slept and his ass was led away from under him.

— Criticism of Religion —

Relying on these statements of Feuerbach, Sancho starts a battle which was likewise already anticipated by Cervantes in the nineteenth chapter, where the *ingenioso hidalgo* fights against the predicates, the mummers, while they are carrying the corpse of the world to the grave and who entangled in their robes and shrouds, are unable to move and so make it easy for our hidalgo to overturn them with his lance and give them a thorough thrashing. The last attempt to exploit further the criticism of religion as an independent sphere (a criticism which has been flogged to the point of exhaustion), to remain within the premises of German theory and yet to appear to be going beyond them, and to cook from this bone, gnawed away to the last fibres, a thin Rumford beggar's broth [31] [for "the] book" — this last attempt consisted in attacking material relations, not in their actual form, and not even in the form of the mundane illusions of those who are practically involved in the present-day world, but in the heavenly extract of their mundane form as predicates, as emanations from God, as angels. Thus, the heavenly kingdom was now repopulated and abundant new material created for the old method of exploitation of this heavenly kingdom. Thus, the struggle against religious illusions, against God, was again substituted for the real struggle. Saint Bruno, who earns his bread by theology, in his "arduous life struggle" against substance makes the same attempt *pro aris et focie* [for home and hearth] as a theologian to go beyond the limits of theology. His "substance" is nothing but the predicates of God united under one name; with the exception of personality, which he reserves for himself — these predicates of God are again nothing but deified names for the ideas of people about their definite, empirical relations, ideas which subsequently they hypocritically retain because of practical considerations.

With the theoretical equipment inherited from Hegel it is, of course, not possible even to understand the empirical, material attitude of these people. Owing to the fact that Feuerbach showed the religious world as an illusion of the earthly world — a world which in his writing appears merely as a *phrase* — German theory too was confronted with the question which he left unanswered: how did it come about that people "got" these illusions "into their heads"? Even for the German theoreticians this question paved the way to the materialistic view of the world, a view which is *not without premises*, but which empirically observes the actual material premises as such and for that reason is, for the first time, *actually* a critical view of the world. This path was already indicated in the *Deutsch-Französische Jahrbücher* — in the *Einleitung zur Kritik der Hegelschen Rechtsphilosophie and Zur Judenfrage*. But since at that time this was done in philosophical phraseology, the traditionally occurring philosophical expressions such as "human essence", "species", etc., gave the German theoreticians the desired reason for misunderstanding the real trend of thought and believing that here again it was a question merely of giving a new turn to their worn-out theoretical garment — just as Dr. Arnold Ruge, the *Dottore Graziano* of German philosophy, imagined that he could continue as before to wave his clumsy arms about and display his pedantic-farcical mask. One has to "leave philosophy aside" (*Wigand*, p. 187, cf. Hess, *Die letzten Philosophen,* p. 8), one has to leap out of it and devote oneself like an ordinary man to the study of actuality, for which there exists also an enormous amount of literary material, unknown, of course, to the philosophers. When, after that, one again encounters people like *Krummacher* or "*Stirner*", one finds that one has long ago left them "behind" and below. Philosophy and the study of the actual world have the same relation to one another as onanism and sexual love. Saint Sancho, who in spite of his absence of thought — which was noted by us patiently and by him emphatically — remains within the world of pure thoughts, can, of course, save himself from it only by means of a moral postulate, the postulate of "*thoughtlessness"* (p. 196 of "the book"). He is a bourgeois who saves himself in the face of commerce by the *banqueroute cochenne*, [32] whereby, of course, he becomes not a proletarian, but an impecunious, bankrupt bourgeois. He does not become a man of the world, but a bankrupt philosopher without thoughts.

The predicates of God handed down from Feuerbach as real forces over people, as hierarchs, are the monstrosity which is substituted for the empirical world and which "Stirner" finds in existence. So heavily does Stirner's entire "peculiarity" depend merely on "prompting". If "Stirner" (see also p. 63) reproaches Feuerbach for reaching no result because he turns the predicate into the subject and vice versa, he himself is far less capable of arriving at anything, [for] he faithfully accepts these Feuerbachian predicates, transformed into subjects, as real personalities ruling [the world], he faithfully accepts these phrases about relations as actual relations, attaching the predicate "holy" to them, transforming *this predicate into a subject,* the "holy", i.e., doing exactly the same as that for which he reproaches Feuerbach. And so, after he has thus completely got rid of the definite content that was the matter at issue, he begins his struggle — i.e., his "antipathy" — against this "holy", which, of course, always remains the same. Feuerbach has still the consciousness "that for him it is 'only a matter of destroying an illusion'" — and it is this with which Saint Max reproaches him (p. 77 of "the book") — although Feuerbach still attaches much too great importance to the struggle against this illusion. In "Stirner" even this consciousness has "all gone", he actually believes in the domination of the abstract ideas of ideology in the modern world; he believes that in his struggle against "predicates", against concepts, he is no longer attacking an illusion, but the real forces that rule the world. Hence his manner of turning everything upside-down, hence the immense credulity with which he takes at their face value all the sanctimonious illusions, all the hypocritical asseverations of the bourgeoisie. How little, incidentally, the "puppet" is the "real kernel" of the "tinsel", and how lame this beautiful analogy is, can best be seen from "Stirner's" own "puppet" — "the book", which contains no "kernel", whether "real" or not "real", and where even the little that there is in its 491 pages scarcely deserves the name "tinsel". — If, however, we must find some sort of "kernel" in it, then that kernel is the *German petty bourgeois.*

Incidentally, as regards the source of Saint Max's hatred of "predicates", he himself gives an extremely naive disclosure in the "Apologetic Commentary". He quotes the following passage from *Das Wesen des Christenthums* (p. 31): "A true atheist is only one for whom the *predicates* of the divine being, e.g., love, wisdom, justice are nothing, but not one for whom only the *subject* of these predicates is nothing" — and then he exclaims triumphantly: "*Does this not hold good for Stirner*?" — "Here is wisdom." In the above passage Saint Max found a hint as to how one should start in order to go "*farthest of all*". He believes Feuerbach that the above passage reveals the "essence" of the "*true atheist",* and lets Feuerbach set him the "task" of becoming a "true atheist". The "unique" is "the *true atheist".*

Even more credulously than in relation to Feuerbach does he "handle" matters in relation to Saint Bruno or "criticism". We shall gradually see all the things that he allows "criticism" to impose on him, how he puts himself under its police surveillance, how it dictates his mode of life, his "calling". For the time being it suffices to mention as an example of his faith in criticism that on page 186 he treats "Criticism" and the "Mass" as two persons fighting against each other and "striving to free themselves from egoism", and on page 187 he "accepts" both "for what *they ... give themselves out to be".*

With the struggle against humane liberalism, the long struggle of the Old Testament, when man was a school-master of the unique, comes to an end; the time is fulfilled, and the gospel of grace and joy is ushered in for sinful humanity.

The struggle over "man" is the fulfilment of the word, as written in the twenty-first chapter of Cervantes, which deals with "the high adventure and rich prize of Mambrino's helmet". Our Sancho, who in everything imitates his former lord and present servant, "has sworn to win Mambrino's helmet" — Man — for himself. After having during his various "campaigns", sought in vain to find the longed-for helmet among the ancients and moderns, liberals and communists, "he caught sight of a man on a horse carrying something on his head which shone like gold". And he said to Don Quixote-Szeliga: "If I am not mistaken, there is someone approaching us bearing on his head that helmet of Mambrino, about which I swore the oath you know of." "Take good care of what you say, your worship, and even greater care of what you do," replied Don Quixote, who by now has become wiser. "Tell me, can you not see that knight coming towards us on a dapple-grey steed with a gold helmet on his head?" — "What I see and perceive," replies Don Quixote, "is nothing but a man on a grey ass like yours with something glittering on his head." — "Why, that is Mambrino's helmet," says Sancho.

Meanwhile, at a gentle trot there approaches them Bruno, the holy barber, on his small ass, criticism, with his barber's basis on his head; Saint Sancho sets on him lance in hand, Saint Bruno jumps from his ass, drops the basin (for which reason we saw him here at the Council without the basin) and rushes off across country, "for he's the Critic himself". Saint Sancho with great joy picks up the helmet of Mambrino, and to Don Quixote's remark that it looks exactly like a barber's basin he replies: "This famous, enchanted helmet, which has become 'ghostly', undoubtedly fell into the hands of a man who was unable to appreciate its worth, and so he melted down one half of it and hammered out the other half 'n such a way that, as you say, it appears to be a barber's basin; in any case, whatever it may look like to the vulgar eye, for me, since I know its value, that is a matter of indifference."

"The second splendour, the second property, has now been won!" Now that he has gained his helmet, "man", he puts himself in opposition to him, behaves towards him as towards his "most irreconcilable enemy" and declares outright to him (why, we shall see later) that he (Saint Sancho) is not "man", but an "unhuman being, the inhuman". In the guise of this "inhuman", he now moves to Sierra-Morena, in order to prepare himself by acts of penitence for the splendour of the New Testament. There he strips himself "stark naked" (p. 184) in order to achieve his peculiarity and surpass what his predecessor in Cervantes does in chapter twenty-five:

"And hurriedly stripping off his breeches, he stood in his skin and his shirt. And then, without more ado, he took two goat leaps into the air burning head over heels, thereby revealing such things as caused his trusty armour-bearer to turn Rosinante aside, so as not to see them."

The "inhuman" far surpasses its mundane prototype. It "*resolutely turns its back on itself* and thus also turns away from the disquieting critic,", and "leaves him behind". The "*inhuman*" then enters into an argument with criticism that has been "left behind"; it "despises itself", it "conceives itself in comparison with another", it "commands God", it "seeks its better self outside itself", it does penance for not yet being unique, it declares itself to be the unique, "the egoistical and the *unique*" — although it was hardly necessary for it to state this after having resolutely turned its back *on itself*. The "Inhuman" has accomplished all this by its own efforts (see Pfister, *Geschichte der Teutschen*) and now, purified and triumphant, it rides on its ass into the kingdom of the unique.

End of the Old Testament

The New Testament: "Ego"[33]

1. The Economy of the New Testament

Whereas in the Old Testament the object of our edification was unique" logic in the framework of the past, we are now confronted by the *present time* in the framework of "unique" logic. We have already thrown sufficient light on the "unique" in his manifold antediluvian "refractions" — as man, Caucasian Caucasian, perfect Christian, truth of humane liberalism, negative unity of realism and idealism, etc., etc. Along with the historical construction of the "ego", the "ego" itself also collapses. This "ego", the end of the historical construction, is no "corporeal" ego, carnally procreated by man and woman, which needs no construction in order to exist; it is an "ego" spiritually created by two categories, "idealism" and "realism," a merely conceptual existence.

The New Testament, which has already been dissolved together with its premise, the Old Testament, possesses a domestic economy that is literally as wisely designed as that of the Old, namely the same "with various transformations", as can be seen from the following table:

I. *Peculiarity* = the ancients, child, Negro, etc., in their *truth*, i.e., development from the "world of things" to one's "own" outlook and taking possession of this world. Among the ancients this led to riddance of the world, among the moderns — riddance of spirit, among the liberals — riddance of the individual, among the communists — riddance of property, among the — humane [liberals] — riddance of God: hence it led in general to the category of riddance (freedom) as the goal. The negated category of *riddance* is peculiarity, which of course has no other content than this riddance. Peculiarity is the philosophically constructed quality of all the qualities of Stirner s individual.

II. The *owner* — as such Stirner has penetrated beyond the *untruthfulness* of the world of things and the world of spirit; hence the moderns, the phase of Christianity within the logical development: youth, Mongol. — Just as the moderns divide into the triply determined free ones, so the owner falls into three further determinations:

1. *My power,* corresponding to *political liberalism*, where the *truth of right* is brought to light and right as the power of "man" is resolved in power as the right of the "ego". The struggle against the *state as such.*

2. *My intercourse*, corresponding to *communism*, whereby the *truth of society* is brought to light and society (in its forms of prison society, family, state, bourgeois society, etc.) as intercourse mediated by "man" is resolved in the intercourse of the "ego".

3. *My self-enjoyment*, corresponding to critical, *humane liberalism*, in which the *truth of criticism*, the consumption, dissolution and truth of absolute self-consciousness, comes to light as self-consumption, and criticism as dissolution in the interests of man is transformed into dissolution in the interests of the "ego".

The peculiarity of the individuals was resolved, as we have seen, in the universal category of peculiarity, which was the negation of riddance, of freedom in general. A description of the special qualities of the individual, therefore, can again only consist in the negation of this "freedom" in its three "refractions"; each of these negative freedoms is now converted by its negation into a positive quality. Obviously, just as in the Old Testament riddance of the world of things and the world of thoughts was already regarded as the acquisition of both these worlds, so here also it is a matter of course that this peculiarity or acquisition of things and thoughts is in its turn represented as perfect riddance.

The "ego" with its property, its world, consisting of the qualities just "pointed out", is *owner*. As self-enjoying and self-consuming, it is the "ego" raised to the second power, the owner of the owner, it being as much rid of the owner as the owner belongs to it; the result is "absolute negativity" in its dual determination as indifference, "unconcern"' and negative relation to itself, the owner. Its property in respect of the world and its riddance of the world is now transformed into this negative relation to itself, into this self-dissolution and self-ownership of the owner. The ego, thus determined, is —

III. *The unique*, who again, therefore, has no other content than that of owner plus the philosophical determination of the "negative relation to himself". The profound Jacques pretends that there is nothing to say about this unique, because it is a corporeal, not constructed individual. But the matter here is rather the same as in the case of Hegel's absolute idea at the end of the *Logik* and of absolute personality at the end of the *Encyklopädie*, about which there is likewise nothing to say because the construction contains everything that can be said about such constructed personalities. Hegel knows this and does not mind admitting it, whereas Stirner hypocritically maintains that his "unique" 's also something different from the constructed unique alone, but something that cannot be expressed, viz., a corporeal individual. This hypocritical appearance vanishes 'f the thing is reversed, if the unique is defined as owner, and it is said of the owner that he has the universal category of peculiarity as his universal determination. This not only says everything that is "*sayable*" about the unique, but also what he is in general — minus the fantasy of Jacques le bonhomme about him.

"O the depth of the riches both of the wisdom and knowledge of the unique! How incomprehensible are his thoughts, and his ways past finding out! " [Romans 11:33]

"Lo, these are parts of his ways: but how little a portion is heard of him!" (Job 26:14.)

2. The Phenomenology of the Egoist in Agreement with Himself, or the Theory of Justification

As we have already seen in "The Economy of the Old Testament" and afterwards, Saint Sancho's true egoist in agreement with himself must on no account be confused with the trivial, everyday egoist, the *egoist in the ordinary sense*". Rather he has as his presupposition both this latter (the one in thrall to the world of things, child, Negro, ancient, etc.) and the selfless egoist (the one in thrall to the world of thoughts, youth, Mongol, modern, etc,). It is, however, part of the nature of the secrets of the unique that this antithesis and the negative unity which follows from it — the "*egoist in agreement with himself*" — can be examined only now, in the New Testament.

Since Saint Max wishes to present the "true egoist" as something quite new, as the goal of all preceding history, he must, on the one hand, prove to the selfless, the advocates of *dévoûment*, that they are egoists against their will, and he must prove to the egoists in the ordinary sense that they are selfless, that they are not true, holy, egoists. — Let us begin with the first, with the selfless.

We have already seen countless times that in the world of Jacques le bonhomme everyone is obsessed by the holy. "Nevertheless it makes a difference" whether "one is educated or uneducated". The educated, who are occupied with pure thought, confront us here as "obsessed" by the holy *par excellence.* They are the "selfless" in their practical guise.

"Who then is selfless? Completely" (!) "most" (!!) "likely" (!!!) "he who stakes everything else on one thing, one aim, one purpose, one passion.... He is ruled by a passion to which he sacrifices all others. And are these selfless not selfish, perhaps? Since they possess only a single ruling passion, they are concerned only with a single satisfaction, but the more ardently oil that account. All their deeds and actions are egoistic, but it is a one-sided, concealed, narrow egoism; it is — obsession" (p. 99).

Hence, according to Saint Sancho, they *possess* only a *single* ruling passion; ought they to be concerned also with the passions which not *they,* but *others possess,* in order to rise to an all-round, unconcealed, unrestricted egoism, in order to correspond to this *alien* scale of "holy" egoism? In this passage are incidentally introduced also the "miser" and the "*pleasure-seeker*" probably because Stirner thinks that he seeks "*pleasure"* as such, holy pleasure, and not all sorts of real pleasures), as also "Robespierre, for example, Saint-Just, and so on " (p. 100) as examples of "selfless, obsessed egoists". "From a certain moral point of view it is argued" (i.e., our holy "egoist in agreement with himself " argues from his own point of view in extreme disagreement with himself) "approximately as follows":

"But if I sacrifice other passions to one passion, still do not thereby sacrifice myself to this passion, and I do not sacrifice anything thanks to which I am truly I myself" (p. 386).

Saint Max is compelled by these two propositions "in disagreement with each other" to make the "paltry" distinction that one may well sacrifice six "for example", or seven, "and so on", passions to a single other passion without ceasing to be "truly I myself", but by no means ten passions, or a still greater number. Of course, neither Robespierre nor Saint-Just was "*truly* I myself", Just as neither was truly "man", but they were *truly* Robespierre and Saint-Just, those unique, incomparable individuals.

The trick of proving to the "selfless" that they are egoists is an old dodge, sufficiently exploited already by Helvétius and Bentham. Saint Sancho's "own" trick consists in the transformation of "egoists in the ordinary sense", the bourgeois, into non-egoists. Helvétius and Bentham, at any rate, prove to the bourgeois that by their narrow-mindedness they *in practice* harm themselves, but Saint Max's " own trick consists in proving that they do not correspond to the "ideal", the "concept", the essence", the "calling", etc., of the egoist and that their attitude towards themselves is not that of absolute negation. Here again he has 'n mind only his German petty bourgeois. Let us point out, incidentally, that whereas on page 99 our saint makes the "miser" figure as a "selfless egoist", on page 78, on the other hand, the "avaricious one" is included among "egoists in the ordinary sense", among the "impure, unholy".

This second class of the hitherto existing egoists is defined on page 99 as follows:

"These people" (the bourgeois) "are therefore not selfless, not inspired, not ideal, not consistent, not enthusiasts; they are egoists in the ordinary sense, selfish people, thinking of their own advantage, sober, calculating, etc."

Since "the book" is not all of a piece, we have already had occasion, in connection with "whimsy" and "political liberalism", to see how Stirner achieves the trick of transforming the bourgeois into non-egoists, chiefly owing to his great ignorance of real people and conditions. This same ignorance serves him here as a lever.

"This" (i.e., Stirner's fantasy about unselfishness) "is repugnant to the stubborn brain of worldly man but for thousands of years he at least succumbed so far that he had to bend his obstinate neck and worship higher powers" (p. 104). The egoists in the ordinary sense "behave half clerically and half in a worldly way, they serve both God and Mammon" (p. 105).

We learn on page 78: "The Mammon of heaven and the God of the world both demand precisely the *same* degree of *self-denial",* hence it is impossible to understand how self-denial for Mammon and self-denial for God can be opposed to each other as "worldly" and "clerical". On page 105-106, Jacques le bonhomme asks himself:

“How does it happen, then, that the egoism of those who assert their personal interest nevertheless constantly succumbs to a clerical or school-masterly, i.e., an ideal, interest?”

(Here, one must in passing “point out” that in this passage the bourgeois are depicted as representatives of *personal* interests.) It happens because:

“Their personality seems to them too small, too unimportant — as indeed it is — to lay claim to everything and be able to assert itself fully. A sure sign of this is the fact that they divide themselves into two persons, an eternal and a temporal; on Sundays they take care of the eternal aspect and on weekdays the temporal. They have the priest within them, therefore they cannot get rid of him.”

Sancho experiences some scruples here; he asks anxiously whether ‘,the same thing will happen” to peculiarity, the egoism in the extraordinary sense.

We shall see that it is not without grounds that this anxious question is asked. Before the cock has crowed twice, Saint Jacob (Jacques le bonhomme) will have “*denied*” himself thrice. [cf. Mark 14: 30]

He discovers to his great displeasure that the two sides prominently appearing in history, the private interest of individuals and the so-called general interest, always accompany each other. As usual, he discovers this in a false form, in its holy form, from the aspect of ideal interests, of the holy, of illusion. He asks: how is it that the ordinary egoists, the representatives of personal interests, are at the same time dominated by general interests, by school-masters, by the hierarchy? His reply to the question is to the effect that the bourgeois, etc., “seem to themselves too small”, and he discovers a “sure sign” of this in the fact that they behave in a religious way, i.e., that their personality is divided into a temporal and an eternal one, that is to say, he explains their religious behaviour by their religious behaviour, after first transforming the struggle between general and personal interests into a mirror image of the struggle, into a simple reflection inside religious fantasy.

How the matter stands as regards the domination of the ideal, see above in the section on hierarchy.

If Sancho’s question is translated from its high-flown form into everyday language, then “it now reads":

— On Class Interests —

How is it that personal interests always develop, against the will of individuals, into class interests, into common interests which acquire independent existence in relation to the individual persons, and in their independence assume the form of *general* interests? How is it that as such they come into contradiction with the actual individuals and in this contradiction, by which they are defined as *general* interests, they can be conceived by consciousness as *ideal* and even as religious, holy interests? How is it that in this process of private interests acquiring independent existence as class interests the personal behaviour of the individual is bound to be objectified [*sich versachlichen*], estranged [*sich entfremden*], and at the same time exists as a power independent of him and without him, created by intercourse, and is transformed into social relations, into a series of powers which determine and subordinate the individual, and which, therefore, appear in the imagination as "holy" powers? Had Sancho understood the fact that within the framework of definite *modes of production*, which, of course, are not dependent on the will, alien [*fremde*] practical forces, which are independent not only of isolated individuals but even of all of them together, always come to stand above people — then he could be fairly indifferent as to whether this fact is presented in a religious form or distorted in the fancy of the egoist, above whom everything is placed in imagination, in such a way that he places nothing above himself. Sancho would then have descended from the realm of speculation into the realm of reality, from what people fancy to what they actually are, from what they imagine to how they act and are bound to act in definite circumstances. What seems to him a product of *thought,* he would have understood to be a product of *life*. He would not then have arrived at the absurdity worthy of him — of explaining the division between personal and general interests by saying that people imagine this division also in a religious way and *seem* to themselves to be such and such, which is, however, only another word for "imagining".

Incidentally, even in the banal, petty-bourgeois German form in which Sancho perceives the contradiction of personal and general interests, he should have realised that individuals have always started out from themselves, and could not do otherwise, and that therefore the two aspects he noted are aspects of the personal development of individuals; both are equally engendered by the empirical conditions under which the individuals live, both are only expressions of *one and the same* personal development of people and are therefore only in *seeming* contradiction to each other. As regards the position — determined by the special circumstances of development and by division of labour — which falls to the lot of the given individual, whether he represents to a greater extent one or the other aspect of the antithesis, whether he appears more as an egoist or more as selfless — that was a quite subordinate question, which could only acquire any interest at all if it were raised in definite epochs of history in relation to definite individuals. Otherwise this question could only lead to morally false, charlatan phrases. But as a dogmatist Sancho falls into error here and finds no other way out than by declaring that the Sancho Panzas and Don Quixotes are born such, and that then the Don Quixotes stuff all kinds of nonsense into the heads of the Sanchos; as a dogmatist he seizes on one aspect, conceived in a school-masterly manner, declares it to be characteristic of individuals as such, and expresses his aversion to the other aspect. Therefore, too, as a dogmatist, the other aspect appears to him partly as a mere *state of mind*, *dévoûment*, partly as a mere "*principle*", and not as a relation necessarily arising from the preceding natural mode of life of individuals. One has, therefore, only to "get this principle out of one's head", although, according to Sancho's ideology, it creates all kinds of empirical things. Thus, for example, on page 180 ‚social life, all sociability, all fraternity and all that ... was created by the life principles or social principle". It is better the other way round: life created the principle.

— On Communism and Morality —

Communism is quite incomprehensible to our saint because the communists do not oppose egoism to selflessness or selflessness to egoism, nor do they express this contradiction theoretically either in its sentimental or 'it its high-flown ideological form; they rather demonstrate its material source, with which it disappears of itself. The communists do not preach *morality* at all, as Stirner does so extensively. They do not put to people the moral demand: love one another, do not be egoists, etc.; on the contrary, they are very well aware that egoism, just as much as selflessness, is in definite circumstances a necessary form of the self-assertion of individuals. Hence, the communists by no means want, as Saint Max believes, and as his loyal *Dottore Graziano* (Arnold Ruge) repeats after him (for which Saint Max calls him "an unusually cunning and politic mind", *Wigand*, p. 192), to do away with the "private individual" for the sake of the "general", selfless man. That is a figment of the imagination concerning which both of them could already have found the necessary explanation in the *Deutsch-Französische Jahrbücher*. Communist theoreticians, the only communists who have time to devote to the study of history, are distinguished precisely by the fact that they alone have *discovered* that throughout history the "general interest" is created by individuals who are defined as "private persons". They know that this contradiction is only a *seeming* one because one side of it, what is called the "general interest", is constantly being produced by the other side, private interest, and in relation to the latter it is by no means an independent force with an independent history — so that this contradiction is in practice constantly destroyed and reproduced. Hence it is not a question of the Hegelian "negative unity" of two sides of a contradiction, but of the materially determined destruction of the preceding materially determined mode of life of individuals, with the disappearance of which this contradiction together with its unity also disappears.

Thus we see how the "egoist in agreement with himself" as opposed to the "egoist in the ordinary sense" and the "selfless egoist", is based from the outset on an illusion about both of these and about the real relations of real people. The representative of personal interests is merely an “egoist in the ordinary sense” because of his necessary contradiction to communal interests which, within the existing mode of production and intercourse, are given an independent existence as general interests and are conceived and vindicated in the form of ideal interests. The representative of the interests of the community is merely “selfless” because of his opposition to personal interests, fixed as private interests, and because the interests of the community are defined as general and ideal interests.

Both the “selfless egoist” and the “egoist in the ordinary sense” coincide, in the final analysis, in *self-denial.*

Page 78: “Thus, self-denial is common to both the holy and unholy, the pure and impure: the impure denies all better feelings, all shame, even natural timidity, and follows only the desire which rules him. The pure renounces his natural relation to the world.... Impelled by the thirst for money, the avaricious person denies all promptings of conscience, all sense of honour, all soft-heartedness and pity; he is blind to all consideration, his desire drives him on. The holy person acts similarly: he makes himself a laughing-stock in the eyes of the world, he is ‘hard-hearted’ and ‘severely just’, for he is carried away by his longing.”

The “avaricious man”, shown here as an impure, unholy egoist, hence as an egoist in the ordinary sense, is nothing but a figure on whom moral readers for children and novels dilate, but that actually occurs only as an exception, and is by no means the representative of the avaricious bourgeois. The latter, on the contrary, have no need to deny the “promptings of conscience”, “the sense of honour”, etc., or to restrict themselves to the one passion of avarice alone. On the contrary, their avarice engenders a series of other passions — political, etc. — the satisfaction of which the bourgeois on no account sacrifice. Without going more deeply into this matter, let us at once turn to Stirner’s “self-denial”. For the self which denies itself, Saint Max here substitutes a different self which exists only in Saint Max’s imagination. He makes the “impure” sacrifice general qualities such as “better feelings”, “shame”, “timidity”, “sense of honour”, etc., and does not at all ask whether the impure actually possesses these properties. As if the “impure” is necessarily bound to possess all these qualities! But even if the “impure” did possess all of them, the sacrifice of these qualities would still be no *self*-denial, but only confirm the fact — which has to be justified even in morality “in agreement with itself” — that for the sake of one passion several others are sacrificed. And, finally, according to this theory, everything that Sancho does or does not do is “self-denial”. He may or may not act in a particular manner ...

[there is a gap here. An extant page, which has been crossed out and greatly damaged, contains the following:] he is an egoist, his own self-denial. If he

pursues an interest he denies the indifference to this interest, if he does something he denies idleness. Nothing is easier for Sancho than to prove to the "egoist in the ordinary sense — his stumbling-block-that he always denies himself, because he always denies the opposite of what he does, and never denies his real interest.

In accordance with his theory of self-denial Sancho can exclaim on page 80: "Is perhaps unselfishness unreal and non-existent? On the contrary, nothing is more common!"

We are really very happy [about the "unselfishness "] of the consciousness of the German petty [bourgeois]....

He immediately gives a good example of this unselfishness by [adducing] Orphanage-F[rancke [34] O'Connell, Saint Boniface, Robespierre, Theodor Körner ...].

O'Connell [...], every [child] in Britain knows this. Only in Germany, and particularly in Berlin, is it still possible to believe that O'Connell is "unselfish". O'Connell, who "tirelessly works" to place his illegitimate children and to enlarge his fortune, who has not for love exchanged his lucrative legal practice (£10,000 per annum) for the even more lucrative job of an agitator (£20,000-30,000 per annum) (especially lucrative in Ireland, where he has no competition); O'Connell who, acting as middleman a "hard-heartedly" exploits the Irish peasants making them live with their pigs while he, King Dan, holds court in princely style in his palace in Merrion Square and at the same time laments continually over the misery of these peasants, "for he is carried away by his longing"; O'Connell, who always pushes the movement just as far as is necessary to secure his national tribute and his position as chief, and who every year after collecting the tribute gives up all agitation in order to pamper himself on his estate at Derrynane. Because of his legal charlatanism carried on over many years and his exceedingly brazen exploitation of every movement in which he participated, O'Connell is regarded with contempt even by the English bourgeoisie, despite his usefulness.

It is moreover obvious that Saint Max, the discoverer of true egoism, is strongly interested in proving that unselfishness has hitherto ruled the world. Therefore he puts forward the great proposition (Wigand, p. 165) that the world was "not egoistic for millennia". At most he admits that from time to time the "egoist" appeared as Stirner's forerunner and "ruined nations".

[III. Consciousness] Although on page 420 Saint Max now says:

"Over the portals of our [epoch] are written not the words ... 'know thyself', [but] turn yourself to account"' [Verwerte Dich]

(here our school-master again transforms the actual turning to account which he finds in existence into a moral precept about turning to account), nevertheless [for the] "egoist in the ordinary [sense' instead of for] the former "selfless egoist", "the [Apollonic" maxim [35] should read:

"Only know yourselves], only know what [you] are in reality and give up your foolish endeavour to be something different from what you are!" "For": "This leads to the phenomenon of deceived egoism, in which I satisfy not myself, but] only one [of my desires, e.] g., the [thirst for] happiness. [— All] your deeds and [actions are secret], concealed ... [egoism,] unconscious egoism, [but] for that very reason not egoism, but slavery, service, self-denial. You are egoists and at the same time not egoists, inasmuch as you deny egoism" (p. 217).

"No sheep, no dog, endeavours to become a real" egoist (p. 443);

no animal" calls to the others: "Only know yourselves, only know what you are in reality". — "It is your nature to be" egoistical, "you are" egoistical "natures, i. e.", egoists. "But precisely because you are that already, you have no need to become so" (ibid.). To what you are belongs also your consciousness, and since you are egoists you possess also the consciousness corresponding to your egoism, and therefore there is no reason at all for paying the slightest heed to Stirner's moral preaching to look into your heart and do penance.

Here again Stirner exploits the old philosophical device to which we shall return later. The philosopher does not say directly: You are not people. [He says:] You have always been people, but you were not *conscious* of what you were, and for that very reason you were not in reality True People. Therefore your appearance was not appropriate to your essence. You were people and you were not people.

In a roundabout way the philosopher here admits that a definite consciousness is appropriate to definite people and definite circumstances. But at the same time he imagines that his moral demand to people — the demand that they should change their consciousness — will bring about this altered consciousness, and in people who have changed owing to changed empirical conditions and who, of course, now also possess a different consciousness, he sees nothing but a changed [consciousness]. — It is just the same [with the consciousness for which you are secretly] longing; [in regard to this] you are [secret, unconscious] egoists — i.e., you are really egoists, insofar as you are *unconscious*, but you are non-egoists, insofar as you are *conscious*. Or: at the root of your present [consciousness lies] a definite being, which is not the [being] which I demand; your consciousness is the consciousness of the egoist such as he should not [be], and therefore it shows that you yourselves are egoists such as egoists should not be — or it shows that you *should be* different from what you *really are*. This entire separation of consciousness from the individuals who are its basis and from their actual conditions, this notion that the egoist of present-day bourgeois society does not possess the consciousness corresponding to his egoism, is merely an old philosophical fad that Jacques le bonhomme here credulously accepts and copies. Let us deal with Stirner's "touching example" of the avaricious person. He wants to persuade this avaricious person, who is not an "avaricious person" in general, but the avaricious "Tom or Dick"; a quite individually defined, "unique" avaricious person, whose avarice is not the category of "avarice" (an abstraction of Saint Max's from his all-embracing, complex, "unique" manifestation of life) and "does not depend on the heading under which other people" (for example, Saint Max) "classify it" — he wants to persuade this avaricious person by moral exhortations that he "is satisfying not himself but one of his desires". But "you are you only for a [moment], only as a momentary being are you real. What [is separated from you,] from the 'momentary being" is something absolutely higher, [e.g., money. But whether] "for you" money is "rather" [a higher pleasure], whether it is for you [something "absolutely higher" or] not [... ?] perhaps ["deny"] myself [? — He] finds that O am possessed [by avarice] day and night, [but] this is so only in his reflection. It is he who makes "day and night" out of the many moments in which I am always the momentary being, always myself, always real, just as he alone embraces in one moral judgment the different moments of my manifestation of life and asserts that they are the satisfaction of avarice. When Saint Max announces that I am satisfying only one of my desires, and not myself, he puts me as a complete and whole being in opposition to me myself. "And in what does this complete and whole being consist? It is certainly not your Momentary being, not what you are at the present moment" — hence, according to Saint Max himself, it consists in the holy "being" (*Wigand*, p. 171). When "Stirner" says that I must change my consciousness, then I know for my part that my momentary consciousness also belongs to my momentary being, and Saint Max, by disputing that I have this consciousness, attacks as a covert moralist my whole mode of life. [III (Consciousness)] And then — "do you exist only when you think about yourself, do you exist only owing to self-consciousness?" (*Wigand*, pp. 157-158.) How can I be anything but an egoist? How can Stirner, for example, be anything but an egoist — whether he denies egoism or not? "You are egoists and you are not egoists, inasmuch as you deny egoism," — that is what you preach.

Innocent, "deceived", "unavowed" school-master! Things are just the reverse. We egoists in the ordinary sense, we bourgeois, know quite well: *Charité bien ordonnée commence par soi-même*, [charity begins at home] and we have long had the motto: love thy neighbour as thyself, interpreted lit the sense that each is his own neighbour. But we deny that we are heartless egoists, exploiters, ordinary egoists, whose hearts can not be lifted up to the exalted feeling of making the interests of their fellow-men their own — which, between ourselves, only means that we declare our interests to be the interests of our fellow-men. [You] deny the "ordinary" [egoism of the] unique egoist [only because] you ["deny]" your ["natural] relations to the [world]". Hence you do not understand why we bring practical egoism to perfection precisely by denying the phraseology of egoism — we who are concerned with realising real egoistical interests, not the holy interest of egoism. Incidentally, it could be foreseen — and here the bourgeois coolly turns his back on Saint Max — that you German school-masters, if you once took up the defence of egoism, would proclaim not real, "mundane and plainly evident" egoism ("the book", p. 455), that is to say, "not what is called" egoism, but egoism in the extraordinary, school-masterly sense, philosophical or vagabond egoism.

The egoist in the extraordinary sense, therefore, is "only now discovered". "Let us examine this new discovery more closely" (p. 11).

From what has been just said it is already clear that the egoists who existed till now have only to change their consciousness in order to become egoists in the extraordinary sense, hence that the egoist in agreement with himself is distinguished from the previous type only by consciousness, i.e., only as a learned man, as a philosopher. It further follows from the whole historical outlook of Saint Max that, because the former egoists were ruled only by the "holy", the true egoist has to fight only against the "holy". "Unique" history has shown us how Saint Max transformed historical conditions into ideas, and then the egoist into a sinner against these ideas; how every egoistic manifestation was transformed into a sin [against these] ideas, [the power of] the privileged into a sin [against the ideal of equality, into the sin of despotism. [Concerning the] idea of freedom [of competition,] therefore, it could be [said in "the book"] that [private property is regarded] by him [(p. 155) as"] the personal" [...] great, [...] [selfless] egoists [...] essential arid invincible [...] only to be fought by transforming them into something holy and then asserting that he abolishes the holiness in them, i.e., his holy idea about them, [i.e.,] abolishes them only insofar as they exist in him as *a holy one.*

[II (Creator and Creation)]

Page 50: "How you are at each moment you are as your creation, and it is precisely in this creation that you do not want to lose yourself, the creator. You yourself are a higher being than yourself, i.e., you are not merely a creation, but likewise a creator; and it is this that you fail to recognise as an involuntary egoist, and for that reason the higher being is something foreign to you."

In a somewhat different variation, this same wisdom is stated on page 239 of "the book":

"The species is nothing" (later it becomes all sorts of things, see "Self-Enjoyment"), land when the individual rises above the limitations of his individuality, it is precisely here that he himself appears as an individual; he

exists only by raising himself, he exists only by not remaining what he is, otherwise he would be done for, dead.”

In relation to these propositions, to his “creation”, Stirner at once begins to behave as “creator”, “by no means losing himself in them":

“You are only for a moment, only as a momentary being are you real.... At each moment I am wholly what I am ... what is separated from you, the momentary being”, is “something absolutely higher” ... (Wigand, p. 170); arid, on page 171 (ibid.), “your being” is defined as momentary being”.

Whereas lit “the book” Saint Max says that besides a momentary being he has also another, higher being, in the “Apologetical Commentary” “the momentary being” [of his] individual is equated with his “complete [and whole] being”, and every [being] as a “momentary being” is transformed [into an] “absolutely higher being”. In “the book” therefore he is, at every moment, a higher being than what he is at that moment, whereas in the Commentary”, everything that he is not directly at a given moment is defined as an absolutely higher being”, a holy, being. — And in contrast to all this division we read on page 200 of “the book":

“I know nothing about a division into an ‘imperfect’ and a ‘perfect’ ego.”

“The egoist in agreement with himself” needs no longer sacrifice himself to something higher, since in his own eyes he is himself this higher being, and he transfers this schism between a “higher” and a “lower being” into himself. So, in fact (Saint Sancho contra Feuerbach, “the book”, p. 243), “the highest being has undergone nothing but a metamorphosis”. The true egoism of Saint Max consists in an egoistic attitude to real egoism, to himself, as he is “at each moment”. This egoistic attitude to egoism is selflessness. From this aspect Saint Max as a creation is an egoist in the ordinary sense; as creator he is a selfless egoist. We shall also become acquainted with the opposite aspect, for both these aspects prove to be genuine determinations of reflection since they undergo absolute dialectics in which each of them is the opposite of itself.

Before entering more deeply into this mystery in its esoteric form, one has to observe some of [its arduous] life battles.

[on pages 82, 83 Stirner achieves the feat of] bringing the most general quality, [the egoist,] [into agreement] with himself as creator, [from the standpoint of the world] of spirit:

["Christianity aimed] at [delivering us from natural determination (determination through nature), from desires as a driving force, it consequently wished that man should not allow himself to be] determined [by his desires. This does not mean that] he [should have] no [desires], but that [desires] should

not possess [him,] that [they] should not become fixed, unconquerable, ineradicable. Could we not apply these machinations of Christianity against desires to its own precept, that we should be determined by the spirit ... ? ... Then this would signify the dissolution of spirit, the dissolution of all thoughts. As one ought to have said there ... so one would have to say now: We should indeed possess spirit, but spirit should not possess us."

"And they that are Christ's have crucified the flesh with the affections and lusts" (Galatians 5:24) — thus, according to Stirner, they deal with their crucified affections and lusts like true owners. He accepts Christianity in instalments, but will not let matters rest at the crucified flesh alone, wanting to crucify his spirit as well, consequently, the "whole fellow".

— Human Nature —

The only reason why Christianity wanted to free us from the domination of the flesh and "desires as a driving force" was because it regarded our flesh, our desires as something foreign to us; it wanted to free us from determination by nature only because it regarded our own nature as not belonging to us. For if I myself am not nature, if my natural desires, my whole natural character, do not belong to myself — and this is the doctrine of Christianity — then all determination by nature — whether due to my own natural character or to what is known as external nature — seems to me a determination by something foreign, a fetter, compulsion used against me, *heteronomy as opposed to autonomy of the spirit.* Stirner accepts this Christian dialectic without examining it and then applies it to our spirit. Incidentally, Christianity has indeed never succeeded in freeing us from the domination of desires, even in that *juste milieu* sense foisted on it by Saint Max; it does not go beyond mere moral injunctions, which remain ineffective in real life. Stirner takes moral injunctions for real deeds and supplements them with the further categorical imperative: "We should indeed possess spirit, but spirit should not possess us" — and consequently all his egoism in agreement with itself is reduced "on closer examination", as Hegel would say, to a moral philosophy that is as delightful as it is edifying and contemplative.

— On Desire and the Conditions of Life —

Whether a desire becomes fixed or not, i.e., whether it obtains exclusive [power over us] — which, however, does [not] exclude [further progress] — depends on whether material circumstances, "bad" mundane conditions permit the normal satisfaction of this desire and, on the other hand, the development of a totality of desires. This latter depends, in turn, on whether we live in circumstances that allow all-round activity and thereby the full development of all our potentialities. On the actual conditions, and the possibility of development they give each individual, depends also whether thoughts become fixed or not — just as, for example, the fixed ideas of the German philosophers, these "victims of society", *qui nous font pitié* [for whom we feel pity] are inseparable from the German 'conditions. Incidentally, in Stirner the domination of desires is a mere phrase, the imprint of the absolute saint. Thus, still keeping to the "touching example" of the avaricious person, we read:

"An avaricious person is not an owner, but a servant, and he can do nothing for his own sake without at the same time doing it for the sake of his master" (p. 400).

No one can do anything without at the same time doing it for the sake of one or other of his needs and for the sake of the organ of this need — for Stirner this means that this need and its organ are made into a master over him, just as earlier he made the *means* for satisfying a need (cf. the. sections on political liberalism and communism) into a master over him. Stirner cannot eat without at the same time eating for the sake of his stomach. If the worldly conditions prevent him from satisfying his stomach, then his stomach becomes a master over him, the desire to eat becomes a fixed desire, and the thought of eating becomes a fixed idea — which at the same time gives him an example of the influence of world conditions in fixing his desires and ideas. Sancho's "revolt" against the fixation of desires and thoughts is thus reduced to an impotent moral injunction about self-control and provides new evidence that he merely gives an ideologically high-sounding expression to the most trivial sentiments of the petty bourgeois.

Thus, in this first example he fights, on the one hand, against his carnal desires, and on the other against his spiritual thoughts — on the one hand against his flesh, on the other against his spirit — when they, his creations, want to become independent of him, their creator. How our saint conducts this struggle, how he behaves as creator towards his creation, we shall now see.

In the Christian "in the ordinary sense", in the *chrétien* "simple", to use Fourier's expression,

"spirit has undivided power and pays no heed to any persuasion of the 'flesh'. However, only through the 'flesh' can I break the tyranny of the spirit; for only when man perceives also his flesh does he perceive himself wholly, and only when he perceives himself wholly does he become perceptive or rational.... But as soon as the flesh speaks and — as cannot be otherwise — in a passionate tone... then he" (the chrétien simple) "believes he hears devil voices, voices against the spirit... and with good reason comes out passionately against them. He would not he a Christian if he were prepared to tolerate them" (p. 83).

Hence, when his spirit wishes to acquire independence in relation to him, Saint Max calls his flesh to his aid, and when his flesh becomes rebellious, he remembers that he is also spirit. What the Christian does in one direction, Saint Max does in both. He is the *chrétien* "*composé*", he once again reveals himself as the perfect Christian.

Here, in this example, Saint Max, as spirit, does not appear as the creator of his flesh and vice versa; he finds his flesh and his spirit both present, and only when one side rebels does he remember that he has also the other, and asserts this other side, as his true ego, against it. Here, therefore, Saint Max is creator only insofar as he is one who is "*also-otherwise-determined",* insofar as he possesses yet another quality besides that which it just suits him to subsume under the category of "creation". His entire creative activity consists here in the good resolution to perceive himself, and indeed to perceive himself *entirely* or be *rational*, [Here, therefore, Saint Max completely justifies Feuerbach's "touching example" of the hetaera and the beloved. In the first case, a man "perceives" *only his flesh* or only her flesh, in the second he perceives *himself entirely* or her *entirely*. See *Wigand*, pp. 170, 171.] to perceive himself as a "complete, entire being", as a being different from "his momentary being", and even in direct contradiction to the kind of being he is "momentarily".

[Let us now turn to one of the "arduous] life battles" [of our saint]:

[Pages 80, 81: "My zeal] need not [be less than the] most fanatical, [but at the same] time [I remain] towards [it cold as ice, sceptical], and its [most irreconcilable enemy;] I remain [its judge, for I am its] owner."

[If one desires to] give [meaning] to what Saint [Sancho] says about himself, then it amounts to this: his creative activity here is limited to the fact that in his zeal he preserves the consciousness of his zeal, that he reflects on it, that he adopts the attitude of the reflecting ego to himself as the real ego. It is to consciousness that he arbitrarily gives the name "creator". He is "creator" only insofar as he possesses *consciousness.*

"Thereupon, you forget yourself in sweet self-oblivion.... But do you exist only when you think of yourself, and do you vanish when you forget yourself? Who does not forget himself at every instant, who does not lose sight of himself a thousand times an hour?" (Wigand, pp. 157, 158).

This, of course, Sancho cannot forgive his "self-oblivion" and therefore "remains at the same time its most irreconcilable enemy".

Saint Max, the creation, burns with immense zeal at the very time when Saint Max, the creator, has already risen above his zeal by means of reflection; or the real Saint Max burns with zeal, and the reflecting Saint Max imagines that he has risen above this zeal. This rising in reflection above what he actually is, is now amusingly and adventurously described in the phrases of a novel to the effect that he allows his zeal to remain in existence, i.e., he does not draw any serious consequences from his hostility to it, but his attitude towards it is "cold as ice", "sceptical" and that of its "most irreconcilable enemy".

Insofar as Saint Max burns with zeal, i.e., insofar as zeal is his true quality, his attitude to it is not that of creator; and insofar as his attitude is that of creator, he does not really burn with zeal, zeal is foreign to him, not a quality of him. So long as he burns with zeal he is not the owner of zeal, and as soon as he becomes the owner, he ceases to burn with zeal. As an aggregate complex, he is at every instant, in the capacity of creator and owner, the sum total of all his qualities, with the exception of the one quality which he puts in opposition to himself, the embodiment of all the others, as creation and property — so that precisely *that* quality which he stresses as his own is always *foreign* to him.

No matter how extravagant Saint Max's true story of his heroic exploits within himself, in his own consciousness, may sound, it is nevertheless an acknowledged fact that there do exist reflecting individuals, who imagine that in and through reflection they have risen above everything, because in actual fact they never go beyond reflection.

This trick — of declaring oneself against some definite quality as being someone who is also — otherwise-determined, namely, in the present example as being the *possessor of reflection directed towards the opposite* — this trick can be applied with the necessary variations to any quality you choose. For example, my indifference need be no less than that 6f the most *blasé* person; but at the same time I remain towards it extremely ardent, sceptical and its most irreconcilable enemy, etc.

[It should] not be forgotten that [the aggregate] complex of all his [qualities, the owner] — in which capacity [Saint] Sancho [by reflecting opposes one particular] quality — is in this [case nothing but Sancho's] simple [reflection about this] one quality, [which he has] transformed [into his ego by] putting forward, instead of the whole [complex, one] merely reflecting [quality and] putting forward in opposition to each of his qualities [and to] the series [merely the one] quality of reflection, an ego, and himself as the imagined ego.

Now he himself gives expression to this hostile attitude to himself, this solemn parody of Bentham's book-keeping [36] of his own interests and qualities.

Page 188: "An interest, no matter towards what end it may be directed, acquires a slave in the shape of myself, if I am unable to rid myself of it; it is no longer my property, but I am its property. Let us, therefore, accept the directive of criticism that we should feel happy only in dissolution."

"We!" — Who are "We?" It never occurs to "us" to "accept" the "directive of criticism". — Thus Saint Max, who for the moment is under the police surveillance of "criticism", here demands "the same well-being for all", "equal well-being for all in one and the same [respect]", "the direct tyrannical domination of *religion*".

His interestedness in the extraordinary sense is here revealed as a heavenly disinterestedness.

Incidentally, there is no need here to deal at length with the fact that in existing society it does not at all depend on Saint Sancho whether an "interest" "acquires a slave in the shape of himself" and whether "he is unable to rid himself of it". The fixation of interests through division of labour and class relations is far more obvious than the fixation of "desires" and "thoughts".

In order to outbid critical criticism, our saint should at least have gone as far as the dissolution of dissolution, for otherwise dissolution becomes an interest which he cannot get rid of, which in him acquires a slave. Dissolution is no longer his property, but he is the property of dissolution. Had he wanted to be consistent in the example just given, [he should] [have treated his zeal against his] own "zeal" as [an "interest"] and [behaved] towards it [as an "irreconcilable] enemy". [But he should have] also considered his ["ice-cold" disinterestedness] in relation to his ["ice-cold" zeal] and become [just as wholly "ice-cold"] and thereby, [obviously, he would have spared] his original ["interest"] and hence himself the "temptation" to turn [in a circle] on the [heel] of speculation. — Instead, he cheerfully continues (ibid.):

I shall only take care to safeguard my own property for myself" (i.e., to safeguard myself from my property) "and, in order to safeguard it, I take it back into myself at any time, I destroy in it any inclination towards independence and absorb it before it becomes fixed and can become a fixed idea or passion."

How does Stirner "absorb" the persons who are his property! Stirner has just allowed himself to be given a "vocation" by "criticism". He asserts that he at once absorbs this "vocation" again, by saying on page 189:

"I do this, however, not for the sake of my human vocation, but because I call on myself to do so."

If I do not call on myself to do so, I am, as we have just heard, a slave, not an owner, not a true egoist, I do not behave to myself as creator, as I should do as a true egoist; therefore, insofar as a person wants to be a true egoist, he must call himself to this vocation given him by "criticism". Thus, it is a universal vocation, a vocation for all, not merely *his* vocation, but also his *vocation.*

On the other hand, the true egoist appears here as an ideal which is unattainable by the majority of individuals, for (p. 434) "innately limited intellects unquestionably form the most numerous class of mankind" — and how could these "limited intellects" be able to penetrate the mystery of unlimited absorption of oneself and the world.

Incidentally, all these terrible expressions — to destroy, to absorb etc. — are merely a new variation of the above-mentioned "ice-cold, most irreconcilable enemy".

Now, at last, we are put in a position to obtain an insight into Stirner's objections to communism. They were. nothing but a preliminary, concealed legitimisation of his egoism in agreement with itself, in which these objections are resurrected in the flesh. The "*equal well-being of all in one and the same respect*" is resurrected in the demand that "we should [only] feel happy in [dissolution". "*Care*]" is resurrected [in the form of the unique "care]" to secure [one's ego] [as one's property]; [but "with the passage of time]" ["care"] again arises as to "how" [one can arrive] at a [unity —] viz., unity [of creator and creation.] And, finally, humanism re[-appears, which in the form of the true] egoist confronts empirical individuals as an unattainable ideal. Hence page 117 of "the book" should read as follows: Egoism in agreement with itself really endeavours to transform every man into a "secret police state". The spy and sleuth "reflection" keeps a strict eye on every impulse of spirit and body, and every deed and thought, every manifestation of life is, for him, a matter of reflection, i.e., a police matter. It is this dismemberment of man into "natural instinct" and "reflection" (the inner plebeian-creation, and the internal police — creator) which constitutes the egoist in agreement with himself.

Hess *(Die letzten Philosophen,* p. 26) reproached our saint:

"He is constantly under the secret police surveillance of his critical conscience.... He has not forgotten the 'directive of criticism ... to feel happy only in dissolution..... The egoist — his critical conscience is always reminding him — should never become so interested in anything as to devote himself entirely to his subject", and so on.

Saint Max "empowers himself" to answer as follows:

When "Hess says of Stirner that he is constantly, etc'. — What does this mean except that when he criticises he wants to criticise not at random" (i.e., by the way: in the unique fashion), "not talking twaddle, but criticising properly" (i.e., like a human being)?

"What it means", when Hess speaks of the secret police, etc., is so clear from the passage by Hess quoted above that even Saint Max's "unique" understanding of it can only be explained as a deliberate misunderstanding. His "virtuosity of thought" is transformed here into a virtuosity in lying, for which we do not reproach him since it was his only way out, but which is hardly in keeping with the subtle little distinctions on the right to lie which he sets out elsewhere in "the book".

Incidentally, we have already demonstrated — at greater length than he deserves — that "when he criticises", Sancho by no means "criticises properly", but "criticises at random" and "talks twaddle".

Thus, the attitude of the true egoist as creator towards himself as creation was first of all defined in the sense that in opposition to a definition in which he became fixed as a creation — for example, as against himself as thinker, as spirit — he asserts himself as a person also-otherwise-determined, as flesh. Later, he no longer asserts himself as *really* also-otherwise-determined, but as the *mere idea of being also-otherwise-determined* in general — hence, in the above example as someone who also-does-not think, who is thoughtless or indifferent to thought, an idea which he abandons again as soon as its nonsensicalness becomes evident. See above on turning round on the heel of speculation. Hence the creative activity consisted here in the reflection that this single determination, in the present case thought, could also be indifferent for him, i.e., it consisted in reflecting in general; as a result, of course, he creates only reflective definitions, if he creates anything at all (e.g., the idea of antithesis, the simple essence of which is concealed by all kinds of fiery arabesques).

As for the *content* of himself as a creation, we have seen that nowhere does he create this content, these definite qualities, e.g., his thought, his zeal, etc., but only the reflective definition of this content as creation, the idea that these definite qualities are his creations. All his qualities are present in him and whence they come is all the same to him. He, therefore, needs neither to develop them — for example, to learn to dance, in order to have mastery over his feet, or to exercise his thought on material which is not given to everyone, and is not procurable by everyone, in order to become the owner of his thought — nor does he need to worry about the conditions in the world, which in reality determine the extent to which an individual can develop.

Stirner actually only rids himself of one quality by means of another (i.e., the suppression of his remaining qualities by this "other"). In reality, however, [as we] have [already shown,] he does this only insofar as this quality has not only achieved free development, i.e., has not remained merely potential, but also insofar as conditions in the world have permitted him to develop in an equal measure a totality of qualities, [that is to say,] thanks to the division of [labour,] thus making possible the [predominant pursuit] of a [single passion, e.g., that of [writing] books. [In general], it is an [absurdity to assume], as Saint [Max does], that one could satisfy one [passion], apart from all others, that one could satisfy it without at the same time satisfying *oneself*, the entire living individual. If this passion assumes an abstract, isolated character, if it confronts me as an alien power, if, therefore, the satisfaction of the individual appears as the one-sided satisfaction of a single passion — this by no means depends on consciousness or "good will" and least of all on lack of reflection on the concept of this quality, as Saint Max imagines.

— Individual and Class Interests —

It depends not on *consciousness,* but on *being*; not on thought, but on life; it depends on the individual's empirical development and manifestation of life, which in turn depends on the conditions obtaining in the world. If the circumstances in which the individual lives allow him only the [one]-sided development of one quality at the expense of all the rest, [If] they give him the material and time to develop only that one quality, then this individual achieves only a one-sided, crippled development. No moral preaching avails here. And the manner in which this one, pre-eminently favoured quality develops depends again, on the one hand, on the material available for its development and, on the other hand, on the degree and manner in which the other qualities are suppressed. Precisely because thought, for example, is the thought of a particular, definite individual, it remains *his* definite thought, determined by his individuality and the conditions in which he lives. The thinking individual therefore has no need to resort to prolonged reflection about thought as such in order to declare that his thought is his own thought, his property; from the outset it is his own, peculiarly determined thought and it was precisely his peculiarity which [in the case of Saint] Sancho [was found to be] the "opposite" of this, a peculiarity which is peculiarity "*as such*". In the case of an individual, for example, whose life embraces a wide circle of varied activities and practical relations to the world, and who, therefore, lives a many-sided life, thought has the same character of universality as every other manifestation of his life. Consequently, it neither becomes fixed in the form of abstract thought nor does it need complicated tricks of reflection when the individual passes from thought to some other manifestation of life. From the outset it is always a factor in the total life of the individual, one which disappears and is reproduced as *required,*

In the case of a parochial Berlin school-master or author, however, whose activity is restricted to arduous work on the one hand and the pleasure of thought on the other, whose world extends from Moabit to Köpenick and ends behind the Hamburger Tor, [37] whose relations to this world are reduced to a minimum by his pitiful position in life, when such an individual experiences the need to think, it is indeed inevitable that his thought becomes just as abstract as he himself and his life, and that thought confronts him, who is quite incapable of resistance, in the form of a fixed power, whose activity offers the individual the possibility of a momentary escape from his "bad world", of a momentary pleasure. In the case of such an individual the few remaining desires, which arise not so much from intercourse with the world as from the constitution of the human body, express themselves only through *repercussion*, i.e., they assume in their narrow development the same one-sided and crude character as does his thought, they appear only at long intervals, stimulated by the excessive development of the predominant desire (fortified by immediate physical causes, e.g. [stomach] spasm) and are manifested turbulently and forcibly, with the most brutal suppression of the ordinary, [natural] desire [— this leads to further] domination over [thought.] As a matter of course, the schoolmaster's [thinking reflects on and speculates about] this empirical [fact in a school]masterly fashion. [But the mere announcement] that Stirner in general "creates" [his qualities] does not [explain] even their particular form of development. The extent to which these qualities develop on the universal or local scale, the extent to which they transcend local narrow-mindedness or remain within its confines, depends not on Stirner, but on the development of world intercourse and on the part which he and the locality where he lives play in it. That under favourable circumstances some individuals are able to rid themselves of their local narrow-mindedness is by no means due to individuals imagining that they have got rid of, or intend to get rid of their local narrow-mindedness, but is only due to the fact that in their real empirical life individuals, actuated by empirical needs, have been able to bring about world intercourse.

The only thing our saint achieves with the aid of his arduous reflection about his qualities and passions is that by his constant crotchetiness and scuffling with them he poisons the enjoyment and satisfaction of them.

Saint Max creates, as already said, only himself as a creation, i.e., he is satisfied with placing himself in this category of created entity. His activity [as] creator consists in regarding himself as a creation, and he does not even go on to resolve this division of himself into [creator and] creation, which is his own [product]. The division [into the "essential" and] the "Inessential" becomes [for him a] permanent life process, [hence mere appearance,] i.e., his real life exists only [in "pure"] reflection, is [not] even actual existence; [for since this latter is at every] instant outside [him and his reflection], he tries [in vain to] present [reflection as] essential.

"But [since] this enemy" (viz., the true egoist as a creation) "begets himself in his defeat, since consciousness, by becoming fixed on him, does not free itself from him, but instead always dwells on him and always sees itself besmirched, and since this content of his endeavour is at the same time the very lowest, we find only an individual restricted to himself and his petty activity" (inactivity), "and brooding over himself, as unhappy as he is wretched" (Hegel) [Phänomenologie des Geistes. B. Selbstbewusstsein. 3. Das unglückliche Bewusstsein].

What we have said so far about the division of Sancho into creator and creation, he himself now finally expresses in a logical form: the creator and the creation are transformed into the presupposing and the presupposed ego, or (inasmuch as his presupposition [of his ego] is a *positing*) into the positing and the posited ego:

"I for my part start from a certain presupposition since I presuppose myself; but my presupposition does not strive for its perfection" (rather does Saint Max strive for its abasement), "on the contrary, it serves me merely as something to enjoy and consume!' (an enviable enjoyment!). "I am nourished by my presupposition alone and exist only by consuming it. But for that reason" (a grand "for that reason"!) "the presupposition in question is no presupposition at all, for since" (a grand "for since"!) "I am the unique" (it should read: the true egoist in agreement with himself), "I know nothing about the duality of a presupposing and presupposed ego (of an 'imperfect' and 'perfect' ego or man)" — it should read: the perfection of my ego consists in this alone, that at every instant I know myself as an imperfect ego, as a creation — " but" (a magnificent "but"!) "the fact that I consume myself signifies merely that I am." (It should read: The fact that I am signifies here merely that in me I consume in imagination the category of the presupposed.) "I do not presuppose myself, because I really only posit or create myself perpetually" (viz., I posit and create myself as the presupposed, posited or created) "and I am I only because I am not presupposed, but posited" (it should read: and I exist only because I am antecedent to my positing) land, again, I am posited only at the moment when I posit myself, i.e., I am creator and creation in one."

Stirner is a "posited man", since he is always a posited ego, and his ego is "*also a man*" (*Wigand*, p. 183). "*For that reason*" he is a posited man; "for *since*" he is never driven by his passions to excesses, "*therefore*", he is what burghers call a sedate man, "*but*" the fact that he is a sedate man "signifies merely" that he always keeps an account of his own transformations and refractions.

What was so far only "for us" — to use for once, as Stirner does, the language of Hegel — viz., that his whole creative activity had no other content than general definitions of reflection, is now "posited" by, Stirner himself. Saint Max's struggle against "*essence*" here attains its "final goal" in that he identifies himself with essence, and indeed with pure, speculative essence. The relation of creator and creation is transformed into an explication of *self-presupposition*, i.e., [Stirner transforms] into an extremely "clumsy" and confused [idea] what Hegel [says] about reflection in "the [Doctrine of Essence]". [Since] Saint Max takes out *one* [element of his] reflection, [viz., positing reflection, his fantasies become] "negative", [because he] transforms himself, etc., into "self-[presupposition", in] contradistinction to [himself as the positing] and himself as the posited, [and] transforms reflection into the mystical antithesis of creator and creation. It should be pointed out, by the way, that in this section of his *Logik* Hegel analyses the "machinations" of the "creative nothing", which explains also why Saint Max already on page 8 had to "posit" himself as this "creative nothing".

We shall now "episodically insert" a few passages from Hegel's explanation of self-presupposition for comparison with Saint Max's explanation. But as Hegel does not write so incoherently and "at random" as our Jacques le bonhomme, we shall have to collect these passages from various pages of the *Logik* in order to bring them into correspondence with Sancho's great thesis.

"Essence presupposes itself and is itself the transcendence of this presupposition. Since it is the repulsion of itself from itself or indifference towards itself, negative relation to itself, it thereby posits itself against itself ... positing has no presupposition ... the other is only posited through essence itself... Thus, reflection is only the negative of itself. Reflection in so far as it presupposes is simply positing reflection. It consists therefore in this, that it is itself and' not itself in a unity" ("creator and creation in one") (Hegel, Logik, II, pp. 5, 16, 17, 18, 22).

One might have expected from Stirner's "virtuosity of thought" that he would have gone on to further researches into Hegel's *Logik*. However, he wisely refrained from doing so. For, if he had done so, he would have found that he, as mere "posited" ego, as creation, i.e., insofar as he possesses *existence*, is merely a *seeming* ego, and he is "*essence*", *creator*, only insofar as he does *not* exist, but only imagines himself. We have already seen, and shall see again further on, that all his qualities, his whole activity, and his whole attitude to the world, are a mere appearance which he creates for himself, nothing but "juggling tricks on the tightrope of the objective". His ego is always a dumb, hidden "ego", hidden in his ego imagined as *essence*.

Since the true egoist in his creative activity is, therefore, only a paraphrase of speculative reflection or pure essence, it follows, "according to the myth", "by natural reproduction", as was already revealed when examining the "arduous life battles" of the true egoist, that his "creations" are limited to the simplest determinations of reflection, such as identity, difference, equality, inequality, [opposition,] etc. — determinations [of reflection] which he [tries] to make clear for himself in ["himself"], concerning whom "the tidings have [gone] as far as [Berlin]". [Concerning] his *presuppositionless* [ego] we [shall] have occasion to "hear [a little] word" later on. See, inter alia, "The Unique".

As in *Sancho's* construction of history the later historical phenomenon is transformed, by Hegel's method, into the cause, the creator, of an earlier phenomenon, so in the case of the egoist in agreement with himself the Stirner of today is transformed into the creator of the Stirner of yesterday, although, to use his language, the Stirner of today is the creation of the Stirner of yesterday. Reflection, indeed, reverses all this, and in reflection the Stirner of yesterday is the creation of the Stirner of today, as a product of reflection, as an idea — just as in reflection the conditions of the external world are *creations* of his reflection.

Page 216: "Do not seek in 'self-denial' the freedom that actually deprives you of yourselves, but seek yourselves" (i.e., seek yourselves in self-denial), "become egoists, each of you should become an all-powerful ego!"

After the foregoing, we should not be surprised if later on Saint Max's attitude to this proposition is again that of creator and most irreconcilable enemy and he "dissolves" his lofty moral postulate: "Become an *all-powerful* ego" into this, that each, in any case, does what he can, and that he can do what he does, and therefore, of course, for Saint Max, he is "all-powerful".

Incidentally, the nonsense of the egoist in agreement with himself is summarised in the proposition quoted above. First comes the moral injunction to seek and, moreover, to seek oneself. This is defined in the sense that man should become something that he so far is not, namely, an egoist, and this egoist is defined as being an "all-powerful ego", in whom the peculiar ability has become resolved from actual ability into the ego, into omnipotence, into the fantastic idea of ability. To seek oneself means, therefore, to become something different from what one is and, indeed, to become *all-powerful*, i.e., nothing, a non-thing, a phantasmagoria.

We have now progressed so far that one of the profoundest mysteries of the unique, and at the same time a problem that has long kept the civilised world in a state of anxious suspense, can be disclosed and solved.

Who is Szeliga? Since the appearance of the critical *Literatur-Zeitung* (see *Die heilige Familie*, etc.) this question has been put by everyone who has followed the development of German philosophy. Who is Szeliga? Everyone asks, everyone listens attentively when he hears the barbaric sound of this name — but no one replies.

Who is Szeliga? Saint Max gives us the key to this "secret of secrets".

Szeliga is Stirner as a creation, Stirner is *Szeliga as* creator. Stirner is the "I", Szeliga the "you", in "the book". Hence Stirner, the creator, behaves towards Szeliga, his creation, as towards his "most irreconcilable enemy". As soon as Szeliga wishes to acquire independence in relation to Stirner — he a made a hapless attempt in this direction in the *Norddeutsche Blätter* — Saint Max "takes him back into himself", an experiment which was carried out against this attempt of Szeliga's on pages 176-79 of the "Apologetic Commentary" in *Wigand.* The struggle of the creator against the creation, of Stirner against Szeliga, is, however, only a seeming one: [Now] Szeliga advances against his creator the phrases of this [creator himself] — for example, the assertion "that [the mere,] bare body is [absence of] thought" (*Wigand*, p. 148). Saint

[Max,] as we have seen, [was thinking] only of [the bare flesh], the body before its [formation], and in [this connection] he gave the body the [determination] of being "the other of thought", non-thought and the non-thinking being, hence absence of thought; and indeed in a later passage he bluntly declares that *only* absence of thought (as previously *only* the flesh — thus the two concepts are treated as identical) saves him from thoughts (p. 196).

We find a still more striking proof of this mysterious connection in *Wigand*, We have already seen on page 7 of "the book" that the "ego", i.e., Stirner, is "the unique". On page 153 of the "Commentary" he addresses his "you": "You......... are the *content of the phrase*",. viz., the content of the "unique", and on the same page it is stated: "he overlooks the fact that *he himself, Szeliga, is the content of the* phrase". "The unique" is a phrase, as Saint Max says in so many words. Considered as the "*ego",* i.e., as *creator*, he is the *owner of the phrase* — this is *Saint Max*. Considered as "*you*", i.e., as *creation*, he is the *content of the phrase* — this is *Szeliga*, as we have just been told. Szeliga the creation appears as a selfless egoist, as a degenerate Don Quixote; Stirner the creator appears as an egoist in the ordinary sense, as Saint Sancho Panza.

Here, therefore, the other aspect of the antithesis of creator and creation makes its appearance, each of the two aspects containing its opposite in itself. Here Sancho Panza Stirner, the egoist in the ordinary sense, is victorious over Don Quixote Szeliga, the selfless and illusory egoist, is victorious over him precisely as Don Quixote by his faith in the world domination of the holy. Who indeed was Stirner's egoist in the [ordinary] sense if not Sancho [Panza,] and who his self-sacrificing egoist [if not] Don Quixote, and what was [their mutual] relation in the [form in which it has so far existed if] not the relation of [Sancho Panza Stirner] to Don Quixote [Szeliga? Now as] Sancho Panza [Stirner belongs to himself as] Sancho only [in order to make Szeliga as] Don Quixote [believe that] he surpasses him in Don [quixotry] and [in accordance with this role, as] the presupposed universal Don [quixotry,] he takes [no steps] against the [Don quixotry of his] former master (Don quixotry, by which he swears with all the firm faith of a servant), and at the same time he displays the cunning already described by Cervantes. In actual content he is, therefore, the defender of the practical petty bourgeois, but he combats the consciousness that corresponds to the petty bourgeois, a consciousness which in the final analysis reduces itself to the idealising ideas of the petty bourgeois about the bourgeoisie to whom he cannot attain.

Thus, Don Quixote now, as Szeliga, performs mental services for his former armour-bearer.

How greatly Sancho in his new "transformation" has retained his old habits, he shows on every page. "Swallowing" and "consuming" still constitute one of his chief qualities, his "natural timidity" has still such mastery over him that the King of

Prussia and Prince Heinrich LXXII become transformed for him into the “Emperor of China” or the “Sultan” and he ventures to speak only about the “G[erman] chambers”; he still strews around him proverbs and moral sayings from his knapsack, he continues to be afraid of “spectres” and even asserts that they alone are to be feared; the only difference is that whereas Sancho in his unholiness was bamboozled by the peasants in the tavern, now in a state of saintliness he continually bamboozles himself.

But let us return to Szeliga. Who has not long ago discovered the hand of Szeliga in all the “phrases” which Saint Sancho put into the mouth of his “you"? And it is always possible to discover traces of Szeliga not only in the phrases of this “you”, but also in the phrases in which Szeliga appears as creator, i.e., as Stirner. But because Szeliga is a creation, he could only figure in *Die heilige Familie* as a “*mystery*”. The revelation of this mystery was the task of Stirner the creator. Me surmised, of course, that some great, holy adventure was at the root of this. Nor were we deceived. The unique adventure really has never been seen or heard of and surpasses the adventure with the fulling mills in Cervantes’ twentieth chapter.

3. The Revelation of John the Divine, or "The Logic of the New Wisdom"

In the beginning was the word, the logos. In it was life, and the life was the light of men. And the light shone in darkness and the darkness *did not comprehend* it. That was the true light, it was in the world, and the world did not know it. He came into *his own*, and his own received him not. But as many as received him, to them gave he power to become owners, who believe in the name of the unique. [But who] has ever [seen] the unique [?]

[Let] us now [examine] this "light of the [world" in "the] logic of the new wisdom [", for Saint] Sancho does not rest content with his previous [destructions].

[In the case of our] "unique" author, it is a matter [of course that] the basis of his [genius lies] in the brilliant [series of personal] advantages [which constitute] his special [virtuosity] of thought. [Since] all these advantages have already been extensively demonstrated, it suffices here to give a brief summary of the most important of them: carelessness of thought — confusion — incoherence — admitted clumsiness — endless repetitions — constant contradiction with himself — unequalled comparisons — attempts to intimidate the reader — systematic legacy-hunting in the realm of thoughts by means of the levers "you", "it", "one", etc., and crude abuse of the conjunctions for, therefore, for that reason, because, accordingly, but, etc. — ignorance — clumsy assertions — solemn frivolity — revolutionary phrases and peaceful thoughts — bluster — bombastic vulgarity and coquetting with cheap indecency — elevation of Nante the loafer[38] to the rank of an absolute concept — dependence on Hegelian traditions and current Berlin phrases — in short, sheer manufacture of a thin beggar's broth (491 pages of it) in the Rumford manner.

Drifting like bones in this beggar's broth are a whole series of *transitions*, a few specimens of which we shall now give for the amusement of the German public depressed as it is:

"Could we not — now, however — one sometimes shares — one can then — to the efficacy of ... belongs especially that which one frequently ... hears called — and that is to say — to conclude, it can now be clear — in the meantime — thus it can, incidentally, be thought here — were it not for — or if, perhaps, it were not — progress from ... to the point that ... is not difficult — from a certain point of view it is argued approximately, thus — for example, and so on", etc., and "it is to that" in all possible "transformations".

We can at once mention here a [logical] trick about which [it is impossible] to decide whether it owes [its] existence to the [lauded] efficiency of Sancho [or to] the inefficiency of his [thinking]. This [trick consists] in seizing on [*one* aspect], treating it as if it were the sole [and only] aspect so far known of an idea [or] concept which [has several well]-defined aspects, foisting this aspect [on the concept as] its *sole characteristic* and then setting [against it every other] aspect under a [new name, as] something original. This is how the concepts of freedom and peculiarity are dealt with, [as] we shall see later.

Among the categories which owe their origin not so much to the personality of Sancho, as to the universal distress in which the German theoreticians find themselves at the present time, the first place is taken by *trashy distinction*, the extreme of trashiness. Since our saint immerses himself in such "soul-torturing" antitheses as singular and universal, private interest and universal interest, ordinary egoism and selflessness, etc., in the final analysis one arrives at the trashiest mutual concessions and dealings between the two aspects, which again rest on the most subtle distinctions — distinctions whose existence side by side is expressed by "*also"* and whose separation from each other is then maintained by means of a miserable "*insofar as*". Such trashy distinctions, for instance, are: how people *exploit* one another, but none does so *at the expense of another*, the extent to which something in me is *inherent* or *suggested;* the construction of *human* and of *unique* work, existing side by side, what is indispensable for *human* life and what is indispensable for *unique* life; what belongs to personality in its pure form and what is essentially fortuitous, to decide which Saint Max, from his point of view, has no criterion at all; what belongs to the *rags and tatters* and what to the *skin* of the individual; what by means of denial he *gets rid of* altogether or *appropriates*, to what extent he sacrifices merely his freedom or merely his peculiarity, in which case he also makes a sacrifice but only insofar as, properly speaking, he does not make a sacrifice; what brings me into relation with others as a link or as a personal relation. Some of these distinctions are absolutely trashy, others — in the case of Sancho at least — lose all meaning and foundation. One can regard as the peak of these trashy distinctions that between the *creation of the world* — by the individual and the *impulse* which the individual receives from the world. If, for example, he had gone more deeply here into this impulse, into the whole extent and multifarious character of its influence on him, he would in the end have discovered the contradiction that he is as *blindly* [*dependent*] on the world as he [egoistically] and ideologically *creates* [it]. (See: "My Self-Enjoyment".) He [would not then have put] side by side [his"] *.also"* and "*insofar as",* [any more than] "human" work [and] unique" work; he would not have opposed one to the other, therefore one would [not have] attacked the other [in the rear,] and the "egoist in *agreement* [with himself"] would not be completely [subordinated to himself] — but we [know] that the latter did not need to be [presupposed] because from the outset this was the point of departure.

This trashy play with distinctions occurs throughout "the book"; It is a main lever also for the other logical tricks and particularly takes the form of a moral casuistry that is as self-satisfied as it is ridiculously cheap. Thus, it is made clear to us by means of examples how far the true egoist has the right to tell lies and how far he has not; to what extent the betrayal of confidence is "despicable" and to what extent it is not; to what extent the Emperor Sigismund and the French King Francis I had the right to break their oath [39] and how far their behaviour in this respect was "disgraceful", and other subtle historical illustrations of the same sort. Against these painstaking distinctions and petty questions there stands out in strong relief the indifference of our Sancho for whom it is all the same and who ignores all actual, practical and conceptual differences. In general we can already say now that his ability to distinguish is far inferior to his ability not to distinguish, to regard all cats as black in the darkness of the holy, and to reduce everything to anything — an art which finds its adequate expression in the use of the *apposition.*

Embrace your "ass", Sancho, you have found him again here. He gallops merrily to meet you, taking no notice of the kicks he has been given, and greets you with his ringing voice. Kneel before him, embrace his neck and fulfil the calling laid down for you by Cervantes in Chapter XXX.

The *apposition* is Saint Sancho's ass, his logical and historical locomotive, the driving force of "the book", reduced to its briefest and simplest expression. In order to transform one idea into another, or to prove the identity of two quite different things, a few intermediate links are sought which partly by their meaning, partly by their etymology and partly by their mere sound can be used to establish an apparent connection between the two basic ideas. These links are then appended to the first idea in the form of an apposition, and in such a way that one gets farther and farther away from the starting-point and nearer and nearer to the point one wants to reach. If the chain of oppositions has got so far that one can draw a conclusion without any danger, the final idea is likewise fastened on in the form of an apposition by means of a dash, and the trick is done. This is a highly recommendable method of insinuating thoughts, which is the more effective the more it is made to serve as the lever for the main arguments. When this trick has been successfully performed several times, one can, following Saint Sancho's procedure, gradually omit some of the intermediate links and finally reduce the series of oppositions to a few absolutely essential hooks.

The apposition, as we have seen above, can also be reversed and thus lead to new, even more complicated tricks and more astounding results. We have seen there, too, that the apposition is the logical form of the infinite series of mathematics.

Saint Sancho employs the apposition in two ways: on the one hand, purely logically, in the canonisation of the world, where it enables him to transform any earthly thing into "the holy", and, on the other hand, historically, in disquisitions on the connection of various epochs and in summing them up, each historical stage being reduced to a single word, and the final result is that the last link of the historical series has not got us an inch farther than the first, and in the end all the epochs of the series are combined in a single abstract category like idealism, dependence on thoughts, etc. If the historical series of oppositions is to be given the appearance of progress, this is achieved by regarding the concluding phrase as the completion of the first epoch of the series, and the intermediate links as ascending stages of development leading to the final, culminating phrase.

Alongside the apposition we have *synonymy*, which Saint Sancho exploits in every way. If two words are etymologically linked or are merely similar in sound, they are made responsible for each other, or if one word has different meanings, then, according to need, it is used sometimes in one sense and sometimes in the other, while Saint Sancho makes it appear that he is speaking of one and the same thing in different "refractions". Further, a special branch of synonymy consists of *translation*, where a French or Latin expression is supplemented by a German one which only half-expresses it, and in addition denotes something totally different; as we saw above, for example, when the word " *respektieren*" was translated "to experience reverence and fear", and so on. One recalls the words *Staat, Status, Stand*, *Notstand,* etc. In the section on communism we have already had the opportunity of observing numerous examples of this use of ambiguous expressions. Let us briefly examine an example of etymological synonymy.

"The word 'Gesellschaft' [society] is derived from the word 'Sal'. If there are many people in a Saal, [hall, room] then the Saal brings it about that they are in society. They are in society and they constitute at most a salon society, since they talk in conventional salon phrases. If real intercourse takes place, it should be regarded as independent of society" (p. 286).

Since the "word '*Gesellschaft'* is derived from '*Sal*'" (which, incidentally, is not true, for the *original* roots of all words are verbs) then "*Sal*" must be equivalent to "*Saal*". But "*Sal*" in old High-German means a *building*; *Kisello, Geselle* — from which *Gesellschaft* is derived — means a *house companion*; hence "*Saal*" is dragged in here quite arbitrarily. But that does not matter; "*Saal*" is immediately transformed into "salon", as though there was not a gap of about a thousand years and a great many miles between the old High-German " *Sal*" and the modern French "*salon*". Thus society is transformed into a salon society, in which, according to the German philistine idea, an intercourse consisting only of phrases takes place and all real intercourse is excluded. — Incidentally since Saint Max only aimed at transforming society into "the holy", he could have arrived at this by a much shorter route if he had made a somewhat more accurate study of etymology and consulted any dictionary of word roots. What a find it would have been for him to discover there the etymological connection between the words "*Gesellschaft" and* "*selig"; Gesellschaft*

— *selig* — *heilig* — *das Heilige* [society-blessed-holy-the holy] — what could look simpler?

If "Stirner's" etymological synonymy is correct, then the communists are seeking the true earldom, the earldom as the holy. As *Gesellschaft* comes from Sal, a building, so *Graf* [earl] (Gothic *garâvo*) comes from the Gothic *râvo*, house. *Sal*, building = *râvo*, house; consequently *Gesellschaft=Grafschaft.* [earldom] The prefixes and suffixes are the same in both words, the root syllables have the same meaning — hence the holy society of the communists is the holy earldom, the earldom as the holy — what could look simpler? Saint Sancho had an inkling of this, when he saw in communism the perfection of the feudal system, i.e., the system of earldoms.

Synonymy serves our saint, on the one hand, to transform empirical relations into speculative relations, by using in its speculative meaning a word that occurs both in practical life and in philosophical speculation, uttering a few phrases about this speculative meaning and then making out that he has thereby also criticised the actual relations which this word denotes as well. He does this with the word *speculation.* On page 406, "speculation" "appears" showing two sides as *one* essence that possesses a "dual manifestation" — O Szeliga! He rages against *philosophical* speculation and thinks he has thereby also settled accounts with *commercial* speculation, about [which] he knows nothing. On the other hand, this synonymy enables him, a concealed petty bourgeois, to transform bourgeois relations (see what was said above in dealing with "communism about the connection between language and bourgeois relations') into personal, individual relations, which one cannot attack without attacking the individuality, "peculiarity" and "uniqueness" of the individual. Thus, for example, Sancho exploits the etymological connection between *Geld* [money] and *Geltung*, [worth, value] Vermögen [wealth, property] *vermögen*, [to be able, capable] etc.

Synonymy, combined with the apposition, provides the main lever for his *conjuring tricks*, which we have already exposed on countless occasions. To give an example how easy this art is, let us also perform a conjuring trick *à la* Sancho.

Wechsel, [change, bill of exchange] as *change,* is the law of phenomena, says Hegel, *This is the reason*, "Stirner" could continue, for the phenomenon of the strictness of the law against false *bills of exchange;* for we see here the law raised above phenomena, the law as such, holy law, the law as the holy, the holy itself, against which sin is committed and which is avenged in the punishment. Or in other words: *Wechsel* "in its dual manifestation", as a bill of exchange *(lettre de change)* and as change (*changement*), leads to *Verfall* [expiry, falling due, decline], (*échéance* and *décadence). Decline* as a result of *change* is observed in history, *inter alia*, in the fall of the Roman Empire, feudalism, the German Empire and the domination of Napoleon. The "transition from" these great *historical crises* "to" the *commercial* *crises* of our day "is not difficult", and this explains also why these commercial crises are always determined by the *expiry of bills of exchange*.

Or he could also, as in the case of "*Vermögen*" and "*Geld*", justify the "*Wechsel*" etymologically and "from a certain point of view argue approximately as follows". The communists want, among other things, to abolish the *Wechsel* (bill of exchange). But does not the main pleasure of the world lie precisely in *Wechsel* (change)? They want, therefore, the dead, the immobile, *China* — that is to say, the perfect Chinese is a communist. "Hence" communist declamations against *Wechsel*briefe and *Wechsler*. As though every letter were not a *Wechsel*brief, a letter that notes a *change,* and every man not a *Wechselnder, a Wechsler*.

To give the simplicity of his construction and logical tricks the appearance of great variety, Saint Sancho needs the *episode*. From time to time he "*episodically*" inserts a passage which belongs to another part of the book, or which could quite well have been left out altogether, and thus still further breaks the thread of his so-called argument, which has already been repeatedly broken without that. This is accompanied by the naive statement that "we" "do not stick to the rules", and after numerous repetitions causes in the reader a certain insensitiveness to even the greatest incoherence. When one reads "the book", one becomes accustomed to everything and finally one readily submits even to the worst. Incidentally, these episodes (as was only [to be] expected from Saint Sancho) are themselves only imaginary and mere repetitions under [other guises] of phrases encountered hundreds of times [already].

After Saint Max has [thus displayed] his personal qualities, and then revealed himself as ["*appearance*" and] as "*essence"* in the distinction, [in] synonymy and in the episode, [we] come [to the] true culmination and completion of logic, the "*concept*".

[The] concept is the "ego" (see Hegel's *Logik*, Part 3), logic [as the ego]. This is the pure relation [of the] ego to the world, a relation [divested] of all the real relations that exist for it; [a formula] for all the equations to [which the holy] man reduces mundane [concepts]. It was already [revealed] above that by applying this formula to all sorts of things Sancho merely makes an unsuccessful "attempt" to understand the various pure determinations of reflection, such as identity, antithesis,, etc.

Let us begin at once with a definite example, e.g., the relation between the "ego" and the people.

1=I am not the people.

The people = non-I

I = the non-people.

Hence, I am the negation of the people, the people is dissolved in me.

The second equation can be expressed also by an auxiliary equation:

The people's ego is non-existent,

or:

The ego of the people is the negation of my ego.

The whole trick, therefore, consists in: 1) that the negation which at the outset belonged to the copula is attached first to the subject and then to the predicate; and 2) that the negation, the "not", is, according to convenience, regarded as an expression of dissimilarity, difference, antithesis or direct dissolution. In the present example it is regarded as absolute dissolution, as complete negation; we shall find that — at Saint Max's convenience — it is used also in the other meanings. Thus the tautological proposition that I am not the people is transformed into the tremendous new discovery that I am the dissolution of the people.

For the equations given above, it was not even necessary for Saint Sancho to have any idea of the people; it was enough for him to know that I and the people are "totally different names for totally different things"; it was sufficient that the two words do not have a single letter in common. If now there is to be further speculation about the people from the standpoint of egoistical logic, it suffices to attach any kind of trivial determination to the people and to "I" from outside, from day-to-day experience, thus giving rise to new equations. At the same time it is made to appear that different determinations are being criticised in different ways. We shall now proceed to speculate in this manner about freedom, happiness and wealth:

Basic equations: The people = non-I.

Freedom of the people = Not my freedom.

Equation No. 1: Freedom of the people = My non-freedom.

Freedom of the people = My lack of freedom.

(This can also be reversed, resulting in the grand proposition: My lack of freedom = slavery is the freedom of the people.)

Happiness of the people = Not my happiness.

Equation No. 2: Happiness of the people = My non-happiness.

Happiness of the people = My unhappiness.

(Reversed equation: My unhappiness, my distress, is the happiness of the people.)

Wealth of the people = Not my wealth.

Equation No. 3: Wealth of the people = My non-wealth.

Wealth of the people = My poverty.

Reversed equation: My poverty is the wealth of the people.) This can be continued *ad libitum* and extended to other determinations.

For the formation of such equations all that is required, apart from a very general acquaintance with such ideas as Stirner can combine in one notion with “people”, is to know the positive expression for the result obtained in the negative form, e.g., “poverty” — for “non-wealth”, etc. That is to say, as much knowledge of the language as one acquires in everyday life is quite sufficient to arrive in this way at the most surprising discoveries.

The entire trick here, therefore, consisted in transforming not-my-wealth, not-my-happiness, not-my-freedom into my non-wealth, my non-happiness, my non-freedom. The “not”, which in the first equation is a general negation that can express all possible forms of difference, e.g., it may merely mean that it is our common, and not exclusively my, wealth — this “not” is transformed in the [second] equation into the negation of my wealth, [my] happiness, etc., and ascribes to me [non-happiness], unhappiness, slavery. [Since] I am denied some definite form of wealth, [the people’s] wealth but by no means [wealth] in general, [Sancho believes poverty] must be ascribed to me. [But] this is also [brought about] by expressing my non-freedom in a positive way and so transforming it into my ["lack of freedom"]. But [my non-freedom] can, of course, also mean hundreds [of other] things — e.g., my ["lack of freedom]”, my non-freedom from [my] body, etc.

We started out just now from the second equation: the people = non-I. We could also have taken the third equation as Our starting-point: I =the non-people, and then, in the case of wealth for example, according to the same method, it would be proved in the end that “my wealth is the poverty of the people”. Here, however, Saint Sancho would not proceed in this way, but would dissolve altogether the property relations of the people and the people itself, and then arrive at the following result: my wealth is the destruction not only of the people’s wealth but of the people itself. This shows how arbitrarily Saint Sancho acted when he transformed non-wealth into poverty. Our saint applies these different methods higgledy-piggledy and exploits negation sometimes in one meaning and sometimes in another. Even “anyone who has not read Stirner’s book” “sees at once” (*Wigand*, p. 191) what confusions this is liable to produce.

In just the same way the “ego” “operates” against the state.

1=I am not the state.

State=non-I.

I="Negation” of the state.

Nothing of the state=I.

Or in other words: I am the “creative nothing” in which the state is swallowed up.

This simple melody can be used to ring the changes with any subject.

The great proposition that forms the basis of all these equations is: I am not non-I. This non-I is given various names, which, on the one hand, can be purely logical, e.g., being-in-itself, other-being, or, on the other hand, the names of concrete ideas such as the people, state, etc. In this way the appearance of a development can he produced by taking these names as the starting-point and gradually reducing them — with the aid of equations, or a series of appositions — again to the non-ego, which was their basis at the outset. Since the real relations thus introduced figure only as different modifications of the non-ego, and only nominally different modifications at that — nothing at all need be said about these real relations themselves. This is all the more ludicrous since [the real] relations are the relations [of the individuals] themselves, and declaring them to be relations [of the non]-ego only proves that one knows nothing about them. The matter is thereby so greatly simplified that even “the great majority consisting of innately limited intellects” can learn the trick in ten minutes at most. At the same time, this gives us a criterion of the “uniqueness” of Saint Sancho.

Saint Sancho further defines the non-ego opposed to the ego as being that which is *alien* to the ego, that which is the alien. The relation of the non-ego to the ego is “therefore” that of alienation [*Entfremdung*]. We have just given the logical formula by which Saint Sancho presents any object or relation whatsoever as that which is alien to the ego, as the alienation of the ego; on the other hand, Saint Sancho can, as we shall see, also present any object or relation as something created by the ego *and belonging to it.* Apart, first of all, from the arbitrary way in which he presents, or does not present, any relation as a relation of alienation (for everything can he made to fit in the above equations), we see already here that his only concern is to present all actual relations, [and also] actual individuals, [as alienated] (to retain this philosophical [expression] for the time being), to [transform] them into the wholly [abstract] phrase of alienation. Thus [instead] of the task of describing [actual] individuals in their [actual] alienation and in the empirical relations of this alienation, [purely empirical] relations, the same happens here — the setting forth is replaced by the [mere idea] of alienation, of [the Alien], of the Holy. [The] substitution of the *category* of alienation (this is again a determination of reflection which can be considered as antithesis, difference, non-identity, etc.) finds its final and highest expression in “the alien” being transformed again into “*the holy”,* and alienation into the relation of the ego to anything whatever as the holy. We prefer to elucidate the logical process on the basis of Saint Sancho's relation to the holy, since this is the predominant formula, and in passing we note that "the alien" is considered also as ',the existing" (*per appos.*), that which exists apart from me, that which exists independently of me, per *appos.,* that which is regarded as independent owing to my non-independence, so that Saint Sancho can depict as the holy everything that exists independently of him, e.g., the Blocksberg. [40]

Because the holy is something alien, everything alien is transformed into the holy; and because everything holy is a bond, a fetter, all bonds and all fetters are transformed into the holy. By this means Saint Sancho has already achieved the result that everything alien becomes for him a mere *appearance*, a mere *idea*, from which he frees himself by simply protesting against it and declaring that he does not have this idea. just as we saw in the case of the egoist not in agreement with himself: people have only to change their consciousness to make everything in the world *all right*.

Our whole exposition has shown that Saint Sancho criticises all actual conditions by declaring them "the holy", and combats them by combating his holy idea of them. This simple trick of transforming everything into the holy was achieved, as we have already seen in detail above, by Jacques le bonhomme accepting in good faith the illusions of philosophy, the ideological, speculative expression of reality divorced from its empirical basis, for reality, just as he mistook the illusions of the petty [bourgeois concerning] the bourgeoisie for the "[holy essence" of the] bourgeoisie, and could therefore imagine that he was only dealing with thoughts and ideas. With equal ease people were transformed into the "holy", for after their thoughts had been divorced from them themselves and from their empirical relations, it became possible to consider people as mere vehicles for these thoughts and thus, for example, the bourgeois was made into the holy liberal.

The positive relation of [Sancho] — who is in the final analysis [pious] — to the holy (a relation [he] calls *respect*) figures also [under the] name of "love". "Love" [is a] relation that approves of "[man"], the holy, the ideal, the supreme being, or such a human, holy, ideal, essential relation. Anything that was elsewhere designated as the existence of the *holy*, e.g., the state, prisons, torture, police, trade and traffic, etc., can also be regarded by Sancho as "another example" of "*love"*. This new nomenclature enables him to write new chapters about what he has already utterly rejected under the trade mark of the holy and respect. It is the old story of the goats of the shepherdess Torralva, in a holy form. And as at one time, with the aid of this story, he led his master by the nose, so now he leads himself and the public by the nose throughout the book without, however, be) rig able to break off his story as wittily as he did in those earlier times when he was still a secular armour-bearer. In general, since his canonisation Sancho has lost all his original mother wit.

The first difficulty appears to arise because this holy is in itself very diverse, so that when criticising some definite holy thing one ought to leave the holiness out of account and criticise the definite content itself. Saint Sancho avoids this rock by presenting everything definite as merely an "*example*" of the holy; just as in Hegel's *Logik* it is immaterial whether atom or personality is adduced to explain "being-for-itself", or the solar system, magnetism or sexual love as an example of attraction. It is, therefore, by no means an accident that "the book" teems with *examples*, but is rooted in the innermost essence of the method of exposition employed in it. This is the unique" possibility which Saint Sancho has of producing an appearance of some sort of content, the prototype of which is already to be found in Cervantes, since Sancho also speaks all the time in examples. Thus Sancho is able to say: "Another example of *the* holy" (the uninteresting) "is labour". He could have continued: another example is the state, another is the family, another is rent of land, another is Saint Jacob (Saint-Jacques, le bonhomme), another is Saint Ursula and her eleven thousand virgins.[41] Indeed, in his imagination, all these things have this in common: that they are the "holy". But at the same time they are totally different things, and it is just this that constitutes their specific nature. Insofar as one speaks of their specific nature, one does not speak of them as "the holy".

[Labour is] not rent of land, and [rent of land] is not the state; [the main] thing, therefore, is to define [what] the state, land rent and labour are [apart from] their imagined holiness, [and Saint] Max achieves this in the following way. [He pretends to] be speaking about the state, [labour,] etc., and then calls ["the" state] the reality of some [sort of idea] — of love, of [being]-for-one-another, of the existing, of power over [Individuals], and — by means [of a] dash — of "the holy", but [he could] have said [that at the] outset. Or [he says] of labour that it is regarded as a life task, [a vocation, a] destiny — "the holy". That is to say, the state and labour are first of all brought under a particular kind of the holy which has been previously prepared in the same way, and this *particular* holy is then again dissolved in the *universal* "holy"; all of which can take place without saying anything about labour and. the state. The same stale cud can then be chewed over again on any convenient occasion, because everything that is apparently the object of criticism serves our Sancho merely as an excuse for declaring that the abstract ideas and the predicates transformed into subjects (which are nothing but suitably assorted holies, a sufficient store of which is always kept in reserve) are what they were made to be at the outset, viz., *the holy*. He has in fact reduced everything to its exhaustive, classic expression, by saying of it that it is "another example of the holy". The definitions which he has picked up by hearsay, and which are supposed to relate to content, are altogether superfluous, and on closer examination it is found, too, that they introduce neither definition nor content and amount to no more than ignorant banalities. This cheap "virtuosity of thought" which polishes off any subject-matter whatever even before knowing anything about it, can of course be acquired by anyone, and not in ten minutes, as previously [stated], but even in five. In the “Commentary” Saint Sancho threatens us with “*treatises*” about Feuerbach, socialism, bourgeois society, and only the holy knows what else. Provisionally we can already here reduce these treatises to their simplest expression as follows:

First treatise: Another example of the holy is *Feuerbach.*

Second treatise: Another example of the holy is *socialism.*

Third treatise: Another example of the holy is *bourgeois society.*

Fourth treatise: Another example of the holy is the “treatise” in the Stirner manner.

Etc., *in infinitum*.

A little reflection shows that the second rock against which Saint Sancho was bound to suffer shipwreck was his own assertion that every individual is totally different from every other, is unique. Since every individual is an altogether different being, hence an other-being, it is by no means necessary that what is alien, holy, for one individual should be so for another individual; it even *can*not be so. And the common name used, such as state, religion, morality, etc., should not mislead us, for these names are only abstractions from the actual attitude of separate individuals, and these objects, in consequence of the totally different attitude towards them of the unique individuals, become for each of the latter *unique* objects, hence totally different objects, which have only their name in common. Consequently, Saint Sancho could at most have said: for me, Saint Sancho, the state, religion, etc., are the alien, the holy. Instead of this he has to make them the absolutely holy, the holy for all individuals — how else could he have fabricated his constructed ego, his egoist in agreement with himself, etc., how else could he at all have written his whole “book"? How little it occurs to him to make each “unique” the measure of his own “uniqueness”, how much he uses his own “uniqueness” as a measure, as a moral norm, to be applied to all other individuals, like a true moralist forcing them into his Procrustean bed, is already evident, *inter alia*, from his judgment on the departed and forgotten Klopstock, whom he opposes with the moral maxim that he ought to have adopted an “attitude to religion altogether *his own”,* in that case he would have arrived not at a *religion of his own,* which would be the correct conclusion (a conclusion that “Stirner” himself draws innumerable times, e.g., in regard to money), but at a “dissolution and swallowing up of religion” (p. 85), a universal result instead of an individual, unique result. As though Klopstock had not arrived at a “dissolution and swallowing up of religion”, and indeed at a quite individual, unique dissolution, such as only this unique Klopstock could have ‚achieved”, a dissolution whose uniqueness “Stirner” could have easily seen even from the many unsuccessful imitations. Klopstock’s attitude to religion is supposed to be not his “own”, although it was altogether peculiar to him, and indeed was a relation to religion which made Klopstock Klopstock. His attitude to religion would have been "peculiar" only if he had behaved towards it not like Klopstock but like a modern German philosopher.

The "egoist in the ordinary sense", who is not so docile as Szeliga and who has already above put forward all sorts of objections, here makes the following retort to our saint: here in the actual world, as I know very well, I am concerned with my own advantage and nothing else, *rien pour la gloire* [mere honour is worth nothing]. Besides this, I enjoy thinking that I am immortal and can have advantages also in heaven. Ought I to sacrifice this egoistical conception for the sake of the mere consciousness of egoism in agreement with itself, which will not bring me in a farthing? The philosophers tell me: that is inhuman. What do I care? Am I not a human being? Is not everything I do human, and human because I do it, and is it any concern of mine how "others" "classify" my actions? You, Sancho, who indeed are also a philosopher, but a bankrupt one — and because of your philosophy you deserve no financial credit, and because of your bankruptcy you deserve no intellectual credit — you tell me that my attitude to religion is not one peculiar to me. What you say, therefore, is the same as what the other philosophers tell me, but in your case, as usual, it loses all meaning since you call "peculiar" what they call "human". Could you speak of any other peculiarity than your own and transform your own relation again into a universal one? In my own way, my attitude to religion, if you like, is also a critical one. Firstly, I have no hesitation in sacrificing it, as soon as it attempts to interfere in my commerce; secondly, in my business affairs it is useful for me to be regarded as religious (as it is useful for my proletarian, if the pie that I eat here he eats at least in heaven); and, finally, I turn heaven into my property. It is *une propriété ajoutée à la propriété*, [property added to property] although already Montesquieu, who was of course a quite different type of man from you, tried to make me believe that it is *une terreur ajoutée à la terreur.* [terror added to terror]My attitude to heaven is not like that of any other person, and by virtue of the unique attitude that I adopt towards it, it is a unique object, a unique heaven. At most, therefore, you are criticising your idea of my heaven, but not my heaven. And now immortality! Here you become simply ridiculous. I deny my egoism — as you assert to please the philosophers — because I immortalise it and declare the laws of nature and thought null and void, as soon as they want to give my existence a determination which is not produced by me myself and is highly unpleasant for rite, namely, death. You call immortality "tedious stability" — as though I could not always live an "eventful" life so long as trade is flourishing in this or the other world and I can do business in other things than your "book". And what can be "more stable" than death, which against my will puts an end to my movement and submerges me in the universal, nature, the species, the holy? And now the state, law, police! For many an "ego" they may appear to be alien powers; but I know that they are my own powers. Incidentally

— and at this point the bourgeois, this time with a gracious nod of the head, again turns his back on our saint — as far as I am concerned, go on blustering against religion, heaven, God and so on. I know all the same that in everything that interests me — private property, value, price, money, purchase and sale — you always perceive something "peculiar".

We have just seen how individuals differ from one another. But every individual again is diverse in himself. Thus, by reflecting himself in one of these qualities, i.e., by regarding, *defining* his "ego" through one of these determinations, Saint Sancho can define the object of the other qualities and these other qualities themselves as the alien, the holy; and so in turn with all his qualities. Thus, for example, that which is object for his flesh is the holy for his spirit, or that which is object for his need of rest is the holy for his need of movement. His transformation, described above, of all action and inaction into self-denial is based on this trick. Moreover, his ego is no real ego, but only the ego of the equations given above, the same ego that in formal logic, in the theory of propositions, figures as *Caius* [42].

"Another example", namely, a more general example of the canonisation of the world, is the transformation of real collisions, i.e., collisions between individuals and their actual conditions of life, into ideal collisions, i.e., into collisions between these individuals and the ideas which they form or get into their heads. This trick, too, is extremely simple. As Saint Sancho earlier made the thoughts of individuals into something existing independently, so here he separates the ideal reflection of real collisions from these collisions and turns this reflection into something existing independently. The real contradictions in which the Individual finds himself are transformed into contradictions of the individual with his idea or, as Saint Sancho also expresses it more simply, into contradictions with the idea *as such*, with the holy. Thus he manages to transform the real collision, the prototype of its ideal copy, into the consequence of this ideological pretence. Thus he arrives at the result that it is not a question of the practical abolition of the practical collision, but only of *renouncing the idea of this collision,* a renunciation which he, as a good moralist, insistently urges people to carry out.

After Saint Sancho has thus transformed all the contradictions and collisions in which the individual finds himself into mere contradictions and collisions of the individual with one or other of his ideas, an idea which has become independent of him and has subordinated him to itself, and, therefore, is "easily" transformed into the idea *as such,* the holy idea, the holy — after this there remains only one thing for the individual to do: to commit the sin against the Holy Spirit, to abstract from this idea and declare the holy to be a spectre. This logical swindle, which the individual performs on himself, our saint regards as one of the greatest efforts of the egoist. On the other hand, however, anyone can see how easy it is in this way to declare that from the egoistical point of view all historically occurring conflicts and movements are subsidiary, without knowing anything about them. To do this one has only to extract a few of the phrases usually adopted in such cases, to transform them, in the manner indicated, into "the holy", to depict the individuals as being subordinated to this holy, and to put oneself forward as one who despises "the holy as such".

A further offshoot of this logical trick, and indeed our saint's favourite manoeuvre, is the exploitation of the words designation, vocation, task, etc., thereby immensely facilitating the transformation of whatever he likes into the holy. For, in vocation, designation, task, etc., the individual appears in his own imagination as something different from what he actually is, as the alien, hence as the holy, and in opposition to his real being he asserts his idea of what he ought to be as the rightful, the ideal, the holy. Thus, when it is necessary for him, Saint Sancho can transform everything into the holy by means of the following series of oppositions: to designate oneself, i.e., to choose a designation (insert here any content you like) for oneself; to choose the designation *as such;* to choose a holy designation, to choose a designation as the holy, i.e., to choose the holy as designation. Or: to be designated, i.e., to have a designation, to have the designation, the holy designation, designation as the holy, the holy as designation, the holy for designation, the designation of the holy.

And now, of course, it only remains for him strongly to admonish people to select for themselves the designation of absence of any designation, the vocation of absence of any vocation, the task of absence of any task — although throughout "the book", "up to and including" the "Commentary", he does nothing but select designations for people, set people tasks and, like a prophet in the wilderness, call them to the gospel of true egoism, about whom, of course, it is said: many are called but only one — *O'Connell* — is chosen.

— The Conditions of Life of a Class Appear as Universal —

We have already seen above how Saint Sancho separates the ideas of individuals from the conditions of their life, from their practical collisions and contradictions, in order then to transform them into the holy. Now these ideas appear in the form of *designation, vocation, task*. For Saint Sancho vocation has a double form; firstly as the vocation which others choose for me — examples of which we have already had above in the case of the newspapers that are full of politics and the prisons that our saint mistook for houses of moral correction. Afterwards vocation appears also as a vocation in which the individual himself believes. If the ego is divorced from all its empirical conditions of life, its activity, the conditions of its existence, if it is separated from the world that forms its basis and from its own body, then, of course, it has no other vocation and no other designation than that of representing the Caius of the logical proposition and to assist Saint Sancho in arriving at the equations given above. In the real world, on the other hand, where individuals have needs, they thereby already have a *vocation and task;* and at the outset it is still immaterial whether they make this their vocation in their imagination as well. It is clear, however, that because the individuals possess consciousness they form an idea of this vocation which their empirical existence has given them and, thus, furnish Saint Sancho with the opportunity of seizing on the word vocation, that is, on the mental expression of their actual conditions of life, and of leaving out of account these conditions of life themselves. The proletarian, for example, who like every human being has the vocation of satisfying his needs and who is not in a position to satisfy even the needs that he has in common with all human beings, the proletarian whom the necessity to work a 14-hour day debases to the level of a beast of burden, whom competition degrades to a mere thing, an article of trade, who from his position as a mere productive force, the sole position left to him, is squeezed out by other, more powerful productive forces — this proletarian is, if only for these reasons, confronted with the real task of revolutionising his conditions. He can, of course, imagine this to be his "vocation", he can also, if he likes to engage in propaganda, express his "vocation" by saying that to do this or that is the human vocation of the proletarian, the more so since his position does not even allow him to satisfy the needs arising directly from his human nature. Saint Sancho does not concern himself with the reality underlying this idea, with the practical aim of this proletarian — he clings to the word "vocation" and declares it to be the holy, and the proletarian to be a servant of the holy — the easiest way of considering himself superior and "proceeding further".

Particularly in the relations that have existed hitherto, when one class always ruled, when the conditions of life of an individual always coincided with the conditions of life of a class, when, therefore, the practical task of each newly emerging class was bound to appear to each of its members as a *universal* task, and when each class could actually overthrow its predecessor only by liberating the individuals of all classes from certain chains which had hitherto fettered them — under these circumstances it was essential that the task of the individual members of a class striving for domination should be described as a universal human task.

Incidentally, when for example the bourgeois tells the proletarian that his, the proletarian's, human task is to work fourteen hours a day, the proletarian is quite justified in replying in the same language that on the contrary his task is to overthrow the entire bourgeois system.

We have already repeatedly seen how Saint Sancho puts forward a whole series of tasks all of which resolve themselves into the final task, which exists for all people, that of true egoism. But even where he does not reflect, and does not see himself as creator and creation, he manages to arrive at a task by means of the following trashy distinction.

Page 466: "Whether you want to continue to occupy yourself with thinking depends on you. If you wish to achieve anything substantial in thinking, then" (the conditions and designations begin for you) "then ... anyone who wishes to think, therefore, certainly has a task, which by having that wish he sets himself, consciously or unconsciously; but no one has the task of thinking."

First of all, apart from any other content of this proposition, it is incorrect even from Saint Sancho's own viewpoint, since the egoist in agreement with himself, whether he wishes it or not, certainly has the "task" of thinking. He must think, on the one hand, to keep in check the flesh, which can be tamed only through the spirit, through thought, and, on the other hand, to be able to fulfil his reflective determination as creator and creation. Consequently he sets the whole world of deceived egoists the "task" of knowing themselves — a "task" which, of course, cannot be accomplished without thought.

In order to change this proposition from the form of trashy distinction into a logical form, one must first of all get rid of the term "substantial". For each person the "substantial" that he wishes to achieve in thought is something different, depending on his degree of education, the conditions of his life and his aim at the time. Saint Max, therefore, does not give us here any firm criterion for determining *when* the task begins which one sets oneself by thinking and how far one can go in thought without setting oneself any task — he limits himself to the relative expression "substantial". But for me everything is "substantial" that induces me to think, everything about which I think is "substantial". Therefore instead of: "if you want to achieve anything substantial in thinking", it should read: "if you want to *think* at all". This depends, however, not at all on your wishing or not wishing, since you possess consciousness and can satisfy your needs only by an activity in which you have to use your consciousness *as well*. Further, the hypothetical form must be got rid of. "If you *want* to think" — then from the outset you are setting yourself the "task" of thinking; Saint Sancho had no need to proclaim this tautological statement with such pomposity. The whole proposition was only clothed in this form of trashy distinction and pompous tautology in order to conceal the content: as a *definite* person, an actual person, you have a *designation*, a task, whether you are conscious of it or not. It arises from your need and the connection of the latter with the existing world. Sancho's real wisdom lies in his assertion that it depends on your will whether you think, live, etc., whether in general you possess any sort of determinateness. He is afraid that otherwise determination would cease to be your self-determination. When you equate your self with your reflection, or according to need, with your will, then it is obvious that in this abstraction everything that is not posited by your reflection or your will is not self-determination — therefore also, for example, your breathing, your blood circulation, thought, life, etc. For Saint Sancho, however, self-determination does not even consist in will but, as we saw already in regard to the true egoist, in the *reservatio mentalis* of indifference to any kind of determinateness — an indifference which reappears here as absence of determination. In his "own" series of oppositions this would assume the following form: as opposed to all real determination, he chooses absence of determination as his determination, at each moment he distinguishes between himself and the undeterminated, thus at each moment he is also some other than he is, a third person, and indeed the other pure and simple, the holy other, the other counterposed to all uniqueness, the undeterminated, the universal, the ordinary — the ragamuffin.

If Saint Sancho saves himself from determination by his leap into absence of determination (which is itself a determination and indeed the worst of all), then the practical, moral content of this whole trick, apart from what was said above in connection with the true egoist, is merely an apology for the vocation forced on every individual in the world as it has existed so far. If, for example, the workers assert in their communist propaganda that the vocation, designation, task of every person is to achieve all-round development of all his abilities, including, for example, the ability to think, Saint Sancho sees in this only the vocation to something alien, the assertion of "the holy". He seeks to free them from this by defending the individual who has been crippled by the division of labour at the expense of his abilities and relegated to a one-sided vocation against his *own* need to become different, a need which has been *stated to be* his vocation by others. What is here asserted in the form of a vocation, a designation, is precisely the negation of the vocation that has hitherto resulted in practice from the division of labour, i.e., the only actually existing vocation — hence, the negation of vocation altogether. The all-round realisation of the individual will only cease to be conceived as an ideal, a vocation, etc., when the impact of the world which stimulates the real development of the abilities of the individual is under the control of the individuals themselves, as the communists desire.

Finally, in the egoistical logic all the twaddle about vocation has moreover the purpose of making it possible to introduce the holy into things and to enable us to destroy them without having to touch them. Thus, for example, one person or another regards work, business affairs, etc., as his vocation. Thereby these become holy work, holy business affairs, the holy. The true egoist does not regard them as vocation; thereby he has dissolved holy work and holy business affairs. So they remain what they are and he remains what he was. It does not occur to him to investigate whether work, business affairs, etc., these modes of existence of individuals, by their real content and process of development necessarily lead to those ideological notions which he combats as independent beings, or, to use his expression, which he canonises.

Just as Saint Sancho canonises communism in order later, in connection with the union, the better to palm off his holy idea of it as his "own" invention, so, in exactly the same way, he blusters against "vocation, designation, task" merely in order to reproduce them throughout his book as the *categorical imperative*. Wherever difficulties arise, Sancho hacks his way through them by means of a categorical imperative such as "turn yourself to account", "recognise yourself", "let each become an all-powerful ego", etc. On the categorical imperative, see the section on the "union"; on "vocation", etc., see the section on "self-enjoyment".

We have now revealed the chief logical tricks Saint Sancho uses to canonise the existing world and thereby to criticise and consume it. Actually, however, he consumes only the holy in the world, without even touching the world itself. Hence it is obvious that he has to remain wholly conservative in practice. If he wanted to criticise, then earthly criticism would begin just where any possible halo ends.

— Social Development Exposes Falsehoods —

The more the normal form of intercourse of society, and with it the conditions of the ruling class, develop their contradiction to the advanced productive forces, and the greater the consequent discord within the ruling class itself as well as between it and the class ruled by it, the more fictitious, of course, becomes the consciousness which originally corresponded to this form of intercourse (i.e., it ceases to be the consciousness corresponding to this form of intercourse), and the more do the old traditional ideas of these relations of intercourse, in which actual private interests, etc., etc., are expressed as universal interests, descend to the level of mere idealising phrases, conscious illusion, deliberate hypocrisy. But the more their falsity is exposed by life, and the less meaning they have for consciousness itself, the more resolutely are they asserted, the more hypocritical, moral and holy becomes the language of this normal society. The more hypocritical this society becomes, the easier it is for such a credulous man as Sancho to discover everywhere the idea of the holy, the ideal. From the universal hypocrisy of society he, the credulous, can deduce universal faith in the holy, the domination of the holy, and can even mistake this holy for the pedestal of existing society. He is the dupe of this hypocrisy, from which he should have drawn exactly the opposite conclusion.

The world of the holy is in the final analysis epitomised in "man". As we have already seen throughout the Old Testament, Sancho regards "man" as the active subject on which the whole of previous history 's based; in the New Testament he extends this domination of "man" to the whole of the existing, contemporary physical and spiritual world, and also to the properties of the individuals at present existing. Everything belongs to "man" and thus the world is transformed into the "world of man". The holy as a person is "man", which for Sancho is only another name for the concept, the idea. The conceptions and ideas of people, separated from actual things, are bound, of course, to have as their basis not actual individuals, but the individual of the philosophical conception, the individual separated from his actuality and existing only in thought, man as such, the concept of man. With this, his faith in philosophy reaches its culmination.

Now that everything has been transformed into "the holy" or into what belongs to "man", our saint is enabled to proceed further to *appropriation*, by renouncing the idea of "the holy" or of "man" as a power standing above him. Owing to the alien having been transformed into the holy, into a mere idea, this idea of the alien, which he mistakes for the actually existing alien, is of course his property. The basic formulas for the appropriation of the world of man (the way in which the ego gains possession of the world when it no longer has any respect for the holy) are already contained in the equations given above.

As we have seen, Saint Sancho is already master of his qualities as the egoist in agreement with himself. In order to become master of the world, all he has to do is to make it one of his qualities. The simplest way of doing so is for Sancho to proclaim the quality of "man", with all the nonsense contained in this, directly as *his* quality. Thus he claims for himself, for example, as a quality of the ego, the nonsense of *universal love of mankind* by asserting that he loves "*everyone*" (p. 387) and indeed with the consciousness of egoism, for "love makes him happy". A person who has such a happy nature, indubitably belongs to those of whom it is said: Woe unto you if you offend even *one of these little ones!* [cf. Luke 17:1-2]

The second method is that Saint Sancho tries to preserve something as a *quality of his,* while he transforms it — when it seems necessary to him as a *relation* — into a relation, a mode of existence, of "man", a *holy relation*, and thereby repudiates it. Saint Sancho does this even when the quality, separated from the relation through which it is realised, becomes pure nonsense. Thus, for example, on page 322 he wants to preserve national pride by declaring that "nationality is one of *his qualities* and the nation *his owner* and master". He could have continued: *religiousness* is a quality of mine, I have no intention of renouncing it as one of my qualities — religion is my master, the holy. Family love is a quality of mine, the family is my master. justice is a quality of mine, the law is my master; to engage in politics is a quality of mine, the state is my master.

The third method of appropriation is employed when some alien power whose force he experiences in practice is regarded by him as holy and spurned altogether without being appropriated. In this case he sees his own powerlessness in the alien power and recognises this powerlessness as his property, his creation, above which he always stands as creator. This, for example, is the case with the state. Here, too, he fortunately arrives at the point at which he has to deal not with something alien, but only with a quality of his own, against which he needs only to set himself as creator in order to overcome it. In an emergency, therefore, the lack of a quality is also taken by him as a quality of his. When Saint Sancho is starving to death it is not due to lack of food, but to his own hungriness, his own quality of starving. If he falls out of a window and breaks his neck, it happens not because the force of gravity plunges him downwards, but because absence of wings, inability to fly, is a quality of his own.

The fourth method, which he employs with the most brilliant success, consists in declaring that everything that is the object of one of his qualities, is, since it is his object, his property, because he has a relation to it by virtue of one of his qualities, irrespective of the character of this relation. Thus, what has up to now been called seeing, hearing, feeling, etc., Sancho, this inoffensive acquisitor, calls: acquiring property. The shop at which I am looking is, as something seen by me, the object of my eye, and its reflection on my retina is the possession of my eye. And now the shop, besides its relation to the eye, becomes his possession and not merely the possession of his eye — his possession, which is as much upside-down as the image of the shop on his retina. When the shopkeeper lets down the shutters (or, as Szeliga puts it, the "blinds and curtains"), his property disappears and, like a bankrupt bourgeois, he retains only the painful memory of vanished brilliance. If "Stirner" passes by the royal kitchen he will undoubtedly acquire possession of the smell of the pheasants roasting there, but he will not even see the pheasants themselves. The only persisting possession that falls to his share is a more or less vociferous rumbling in his stomach. incidentally, what and how much he can see depends not only on the existing state of affairs in the world, a state of affairs by no means created by him, but also on his purse and on the position in life which falls to his lot owing to division of labour, which perhaps shuts away very much from him, although he may have very acquisitive eyes and ears.

If Saint Sancho had said simply and frankly that everything that is the object of his imagination, as an object imagined by him, i.e., as his idea of an object, is his idea, i.e., his possession (and the same thing holds with looking at something, etc.), one would only have marvelled at the childish näiveté of a man who believes that such a triviality is a discovery and a fortune. But the fact that he passes off this conjectural property as property in general was bound, of course, to have a magical attraction for the propertyless German ideologists.

Every other person in his sphere of action, too, is his object, and "as his object — his property", his creature. Each ego says to the other (see p. 184):

"For me you are only what you are for me" (for example, my exploiteur), "namely my object and, because my object, my property."

Hence also my creature, which at any moment as creator I can swallow up and take back into myself. Thus, each ego regards the other not as a property-owner, but as his property; not as "ego" (see [p. 184)l but as being-for-him, as object; not as belonging to himself, but as belonging to *him*, to another, as alienated *from himself.* 'Let us take both for what they give themselves out to be" (p. 187), for property-owners, for something belonging to themselves, "and for what they take each other to be", for property, for something belonging to the alien. They are property-owners and they are not property-owners (cf. p. 187). What is important for Saint Sancho, however, in all relations to others, is not to take the real relation, but how each can see himself in his imagination, in his reflection.

Since everything that is *object* for the "ego" is, through the medium of one or other of his properties, also *his* object and, therefore, *his property* — thus, for example, the beatings he receives as the object of *his* members, *his* feelings and *his* mind, are *his* object and, therefore, his property — he is able to proclaim himself the owner of every object that exists for him. By this means he can proclaim that the world surrounding him is his property, and that he is its owner — no matter how much it maltreats him and debases him to the level of a "man having only ideal wealth, a ragamuffin". On the other hand, since every object for the "ego" is not only *my* object, but also my *object,* it is possible, with the same indifference towards the content, to declare that every *object* is not-my-own, alien, holy. one and the same object and one and the same relation can, therefore, with equal ease and with equal success be declared to be the holy and my property. Everything depends on whether stress is laid on the word "*my*" or on the word "*object*". The methods of appropriation and canonisation are merely two different "refractions" of one "transformation".

All these methods are merely positive expressions for negating what was posited as alien to the ego in the above equations; except that the negation is again, as above, taken in various determinations. Negation can, firstly, be determined in a purely formal way, so that it does not at all affect the content — as we saw above in the case of love of mankind and in all cases when its whole alteration is limited to introducing consciousness of indifference. Or the whole sphere of the object or predicate, the whole content, can be negated, as in the case of religion and the state. Or, thirdly, the copula alone, my hitherto alien relation to the predicate, can be negated and the stress laid on the word "*my*" so that my attitude to what is mine is that of property-owner — in the case of money, for instance, which becomes coin of my own coining. In this last case both the quality of Man and his relation can lose all meaning. Every one of the qualities of Man, by being taken back into myself, is extinguished in my individuality. It is no longer possible to say what the quality is. It remains only nominally what it was. As "*mine*", as determinateness dissolved in me, it no longer has any determinateness whether in relation to others or in relation to me, it is only posited by me, an *illusory* quality. Thus, for example, my thought. just as with my qualities, so with the things which stand in a relation to me and which, as we have seen above, are basically also only my qualities — as, for example, in the case of the shop I am looking at. Insofar, [therefore,] as thought in me is totally [different] from all [other] qualities, just as, for example, a jeweller's shop is totally different from a sausage shop, etc. — the [difference] emerges again as a difference of appearance, and reasserts itself externally too in my manifestation for others. Thereby this annihilated determinateness is fortunately restored and, insofar as it is at all possible to express it in words, must also be reproduced in the old expressions. (Incidentally, we shall be hearing a little more yet concerning Saint Sancho's non-etymological illusions about language.)

The simple equation encountered above is here replaced by the *antithesis*. In its simplest form it is expressed, for example, as follows:

Man's thought — my thought, egoistical thought,

where the word my means only that he can also be without thoughts, so that the word *my* abolishes *thought*. The antithesis already becomes more complicated in the following example:

Money as man's means of exchange — Money of my own coining as the egoist's means of exchange

where the absurdity stands revealed.

The antithesis becomes still more complicated when Saint Max introduces a determination and wants to create the appearance of a far-reaching development. Here the single antithesis becomes a series of antitheses. First of all, for example, it is stated:

Right in general as the right of man Right is what is right for me,

where, instead of right, he might equally well have put any other word, since admittedly it no longer has any meaning. Although this nonsense continues to crop up all the time, in order to proceed further he has to introduce another, *well-known* determination of right which can be used both in the purely personal and in the ideological sense — for example, *might* as the basis of right. Only now, where the right mentioned in the first thesis has acquired yet another determination, which is retained in the antithesis, can this antithesis produce Some content. Now we get:

Right — might of Man — Might — my right

which then again simply becomes reduced to:

1=Might as my right = My might.

These antitheses are no more than positive reversals of the above-mentioned negative equations, in which antitheses continually proved to be contained in the conclusion. They even surpass those equations in simple grandeur and great simple-mindedness.

Just as previously Saint Sancho could regard everything as *alien*, as existing independently of him, as holy, so now with equal ease he can regard everything as his own product, as only existing thanks to him, as his property. Indeed, since he transforms everything into his qualities, it only remains for him to behave towards them as he behaves towards his original qualities, in the capacity of the egoist in agreement with himself, a procedure we do not need to repeat here. In this way our Berlin school-master becomes the absolute master of the world — "this, of course, is also the case with every goose, every dog, every horse" (*Wigand*, p. 187).

The real logical experiment, on which all these forms of appropriation are based, is a mere form of *speech,* namely a *paraphrase*, expressing one relation as a manifestation, as a mode of existence of another. just as we have seen that every relation can be depicted as an example of the relation of property, in exactly the same way it can be depicted as the relation of love, might, exploitation, etc. Saint Sancho found this manner of paraphrase ready-made in philosophical speculation where it plays a very important part. See below on the "theory of exploitation".

The various categories of appropriation become emotional categories as soon as the appearance of practice is introduced and appropriation is to be taken seriously. The emotional form of assertion of the ego against the alien, the holy, the world of "Man", is *bragging.* Refusal to revere the holy is proclaimed (reverence, respect, etc. — these emotional categories serve to express his relation to the holy or to some third thing as the holy), and this permanent refusal is entitled a deed, a deed that appears all the more comic because all the time Sancho is battling only against the spectre of his own sanctifying conception. On the other hand, since the world, despite his refusal to revere the holy, treats him in the most ungodly fashion, he enjoys the inner satisfaction of declaring to the world that he has only to attain power over it in order to treat it without any reverence. This threat with its world-shattering *reservatio mentalis* completes the comedy. To the first form of bragging belongs Saint Sancho's statement on page 16 that he "is not afraid of the anger of *Poseidon,* nor of the vengeful *Eumenides*", "does not fear the curse" (p. 58), "desires no forgiveness" (p. 242), etc., and his final assurance that he commits "the most boundless desecration" of the holy. To the second form belongs his threat against the moon (p. 218):

"If only I could seize you, I would in truth seize you, and if only I could find a means to get to you, you would in no way terrify me.... I do not surrender to you, but am only hiding my time. Even if for the present I refrain from having designs on you, I still have a grudge against you" —

an apostrophe in which our saint sinks below the level of Pfeffel's pug-dog in the ditch. [43] And likewise on page 425, where he "does not renounce power over life and death", etc.

Finally, the practice of bragging [can] again become mere [practice] within the sphere of theory [by] our holy man [asserting] in the [most] pompous language that he has performed actions that he has never performed, and [at the same time] endeavouring by means of high-sounding phrases to smuggle in traditional trivialities [as] his original creations. Actually this is characteristic of the *entire book,* particularly his construction of history — which is foisted on us as an exposition of his thought but is only a bad piece of copying out — then the assurance that "the book" "appears to be written against man" (*Wigand*, p. 168), and a multitude of separate assertions, such as: "With one puff of the living ego I blow down whole peoples" (p. 219 of "the book"), "I recklessly attack" (p. 254), "the people is dead" (p. 285), further the assurance that he "delves into the bowels of right" (p. 275), and, finally, the challenging call, embellished with quotations and aphorisms, for "a flesh-and-blood opponent" (p. 280).

Bragging is already in itself sentimental. But, in addition, *sentimentality* occurs in "the book" as a particular category, which plays a definite part especially in positive appropriation that is no longer mere assertion against the alien. However simple the methods of appropriation so far examined, with a more detailed exposition the appearance has to be given that the ego thereby acquires also property "in the ordinary sense", and this can only be achieved by a forcible puffing-up of this ego, by enveloping himself and others in a sentimental charm. Sentimentality cannot be avoided since, without previous examination, he claims the predicates of "Man" as his own — he asserts, for example, that he "loves" "*everyone*" "out of egoism" — and thus gives his qualities an exuberant turgidity. Thus, on page 351, he declares that the "smile of the infant" is "his property" and in the same passage the stage of civilisation at which old men are no longer killed off is depicted with the most touching expressions as the deed of these old men themselves, etc. His attitude to Maritornes also belongs wholly to this same sentimentality.

The unity of sentimentality and bragging is *rebellion.* Directed outwards, against others, it is bragging; directed inwards, as grumbling-in-oneself, it is sentimentality. It is the specific expression of the impotent dissatisfaction of the philistine. He waxes indignant at the thought of atheism, terrorism, communism, regicide, etc. The object against which Saint Sancho rebels is *the holy;* therefore rebellion, which indeed is also characterised as a crime, becomes, in the final analysis, a sin. It is therefore by no means necessary for rebellion to take the form of an *action*, as it is only the "sin" against "the holy". Saint Sancho, therefore, is satisfied with "getting" "holiness" or the "spirit of alienation" "out of his head" and accomplishing his ideological appropriation. But just as present and future are altogether confused in his head, and just as he sometimes asserts that he has already appropriated everything and sometimes that it has still to be acquired, so in connection with rebellion also at times it occurs to him quite accidentally that he is still confronted by the *actually existing* alien even after he has finished with the halo of the alien. In this case, or rather in the case of this sudden idea, rebellion is transformed into an imaginary act, and the ego into we". We shall examine this in more detail later (see "*Rebellion*").

The true egoist, who from the description given so far has proved to be the greatest conservative, finally collects up the fragments of the "world of man", twelve basketfuls; for "far be it that anything should be lost!" Since his whole activity is limited to trying a few hackneyed, casuistical tricks on the world of thoughts handed down to him by philosophical tradition, it is a matter of course that the real world does not exist for him at all and, therefore, too, remains in existence as before. The content of the New Testament will furnish us with detailed proof of this.

Thus, "we appear at the bar of majority and are declared of age" (p. 86).

4. Peculiarity

“To create for oneself one’s own world, that means building a heaven for oneself” (p. 89 of “the book”).

[Leopold Ranke’s “Einleitung” in Historisch-politische Zeitschrift. I. Band, Hamburg, 1832 — the place and date of publication are cited incorrectly in the text]

We have already “penetrated” into the innermost sanctuary of this heaven; now we shall try to learn “more things” about it. In the New Testament, however, we shall rediscover the same hypocrisy that permeated the Old Testament. just as in the latter the historical data were only names for a few simple categories, so here in the New Testament, too, all worldly relations are only disguises, different designations, for the meagre content which we have assembled in the “Phenomenology” and “Logic”. Under the appearance of speaking about the actual world, Saint Sancho always speaks only about these meagre categories.

“You do not want the freedom to have all these fine things.... You want to have them in actuality ... to possess them as your property.... You ought to be not only a free person, but also an owner” (p. 205).

One of the oldest formulas arrived at by the early social movement — the opposition between socialism in its most miserable form and liberalism — is here exalted into an utterance of the “egoist in agreement with himself”. How old this opposition is even for Berlin, our holy man could have seen if only from the fact that it is mentioned with terror already in Ranke’s *Historisch-politische Zeitschrift,* Berlin, 1831 .

“How I utilise it” (freedom) “depends on my peculiarity” (p. 205).

The great dialectician can also reverse this and say: “How I utilise my peculiarity depends on my freedom.” — Then he continues:

“Free — from what?”

Here, therefore, by means of a dash freedom is already transformed into freedom *from something* and, *per appos.,* from “everything”. This time, however, the apposition is given in the form of a proposition that apparently provides a closer definition. Having thus achieved this great result, Sancho becomes sentimental.

“Oh, how much can be shaken off!" First, the “yoke of serfdom”, then a whole series of other yokes, leading imperceptibly to the result that “the most perfect self-denial is nothing but freedom, freedom ... from one’s own ego, and the urge towards freedom as something absolute ... has deprived us of our peculiarity.”

By means of an extremely artless series of yokes, liberation from serfdom, which was the assertion of the individuality of the serfs and at the same time the abolition of a definite empirical barrier, is here equated with the much earlier Christian-idealist freedom of the Epistles to the Romans and Corinthians, thereby transforming freedom in general into self-denial. At this point we have already finished with freedom, since it is now indisputably the "holy". Saint Max transforms a definite historical act of self-liberation into the abstract category of "freedom", and this category is then defined more closely by means of a totally different historical phenomenon which can likewise be included under the general conception of "freedom". This is the whole trick by which the throwing off of the yoke of serfdom is transformed into self-denial. To make his theory of freedom as clear as noonday to the German burgher, *Sancho* now begins to declaim in the burgher's own language, particularly that of the Berlin burgher:

"But the freer I become, the larger does compulsion loom before my eyes, and the more powerless do I feel. The unfree son of the wilds is not yet aware of all the limitations that trouble an 'educated' man, he imagines himself freer than the latter. In proportion as I achieve freedom for myself I create new limits and new tasks for myself; no sooner have I invented railways than I again feel myself weak because I still cannot sail through the air like a bird, and I have no sooner solved a problem that was perplexing my mind than countless others await me," etc. (pp. 205, 206).

O "clumsy" story-writer for townsman and villager!

Not the "unfree sons of the wilds" but "educated people" "imagine" the savage freer than the educated man. That the son of the wilds" (whom F. Halm brought on the stage [Friedrich Halm, Der Sohn der Wildniss]) is ignorant of the limitations of the educated man because he cannot experience them is just as clear as that the "educated" citizen of Berlin, who only knows the "son of the wilds" from the theatre, knows nothing of the limitations of the savage. The simple fact is this: the limitations of the savage are not those of the civilised man. The comparison that our saint draws between them is the fantastic comparison of an "educated" Berliner whose education consists of knowing nothing about either of them. That he knows nothing of the limitations of the savage is explicable, although after the large number of new travel books, it is certainly easy enough to know something about them; but that he is also ignorant of the limitations of the educated man, is proved by his example of railways and flying. The inactive petty bourgeois, for whom railways dropped from the sky and who for that very reason I imagines that he invented them himself, begins to indulge in fantasies about aerial flight after having once travelled by railway. Actually, the balloon came *first* and then the railways. Saint Sancho had to reverse this, for otherwise everyone would have seen that when the balloon was invented the demand for railways was still a long way off, whereas the opposite is easy to imagine. In general, Sancho turns empirical relations upside down. When hackney carriages and carts no longer sufficed for the growing requirements of communication, when, *inter alia*, the centralisation of production due to large-scale industry necessitated new methods to accelerate and expand the transport of its mass of products, the locomotive was invented and thus the use of railways for transport on a large scale. The inventor and shareholders were interested in their profits, and commerce in general in reducing production costs; the possibility, indeed the absolute necessity, of the invention lay in the empirical conditions. The application of the new invention in the various countries depended on the various empirical conditions; in America, for example, on the need to unite the individual states of that vast area and to link the semi-civilised districts of the interior with the sea and the markets for their products. (Compare, *inter alia,* M. Chevalier, *Lettres sur 1'Amérique du Nord.*) In other countries, for example in Germany, where every new invention makes people regret that it does not complete the sum total of inventions — in such countries after stubbornly resisting these detestable railways which cannot supply them with wings, people are nevertheless compelled by competition to accept them in the end and to give up hackney carriages and carts along with the time-honoured, respectable spinning-wheel. The absence of other profitable investment of capital made railway construction the predominant branch of industry in Germany. The development of her railway construction and reverses on the world market went hand in hand. But nowhere are railways built for the sake of the category "*freedom from*"; Saint Max could have realised this even from the fact that no one builds railways in order to *free* himself *from* his money. The real kernel of the burgher's ideological contempt for railways due to his longing to fly like a bird is to be found in his preference for hackney carriages, vans and country roads. Sancho yearns for his "own world" which, as we saw above, is heaven. Therefore he wants to replace the locomotive by Elijah's fiery chariot and be carried up to heaven.

After the actual tearing down of restrictions — which is at the same time an extremely positive development of the productive forces, real energy and satisfaction of urgent requirements, and an expansion of the power of individuals — after the actual tearing down of restrictions has been transformed in the eyes of this passive and ignorant spectator into simple freedom from a restriction, which he can again logically make into a postulate of freedom *from* restriction *as such* — at the conclusion of the whole argument, we arrive at what was already presupposed at the beginning:

"To be free from something means only to be relieved of something, to be rid of something" (p. 206).

He at once gives an extremely unfortunate example: "He is free of headache is equivalent to saying: he is rid of it"; as though this "riddance" of headache were not equivalent to a wholly positive ability to dispose of my head, equivalent to ownership of my head, while as long as I had a headache I was the property of my sick head.

"In 'riddance' — in riddance from sin, from God, from morality, etc. — we consummate the freedom that Christianity recommends" (p. 206).

Hence our "consummate Christian", too, finds his peculiarity only in "riddance" from "thought", from "determination", from "vocation", from "law", from "constitution", etc., and invites his brothers in Christ to "feel happy only in dissolution", i.e., in accomplishing "riddance" and the "consummate", "Christian freedom". He continues:

"Ought we, perhaps, to renounce freedom because it turns out to he a Christian ideal? No, nothing should be lost" (voilà notre conservateur tout trouvé [there's the conservative all complete]), "freedom too should not be lost, it should however become our own, and it cannot become our own in the form of freedom" (p. 207).

Here "our egoist" (*toujours et partout* [always and everywhere]) "in agreement with himself" forgets that already in the Old Testament, thanks to the Christian ideal of freedom, i.e., thanks to the illusion of freedom, we became "owners" of the "world of things"; he forgets, likewise, that accordingly we had only to get rid of the "world of thoughts" to become "owners" of that world as well, that in this context peculiarly" was for him a *consequence* of freedom, of riddance.

Having interpreted freedom as the state of being free from something, and this, in turn, as "riddance", and this as the Christian ideal of freedom, and hence as the freedom of "Man", our saint can, with the material thus prepared, carry through a practical course of his logic. The first, simplest antithesis reads:

Freedom of Man — My freedom,

where in the antithesis freedom ceases to exist "in the form of freedom". Or:

Riddance in the interests of Man — Riddance in my interests.

Both these antitheses, with a numerous retinue of declamations, continually appear throughout the chapter on peculiarity, but with their help alone our world-conquering Sancho would attain very little, he would not even attain the island of Barataria. Earlier, when observing the behaviour of people from his "own world", from his "heaven", he set aside two factors of actual liberation in making his abstraction of freedom. The first factor was that individuals in their self-liberation satisfy a definite need actually experienced by them. As the result of setting aside this factor, "*Man*" has been substituted for actual individuals, and striving for a fantastic ideal — for freedom as such, for the "freedom of Man" — has been substituted for the satisfaction of actual needs.

The second factor was that an ability that has hitherto existed merely as a potentiality in the individuals who are freeing themselves begins to function as a real power, or that an already existing power becomes greater by removal of some restriction. The removal of the restriction, which is merely a *consequence* of the new creation of power, can of course be considered the main thing. But this illusion arises only if one takes politics as the basis of empirical history, or if, like Hegel, one wants everywhere to demonstrate the negation of negation, or finally if, after the new power has been created, one reflects, as an ignorant citizen of Berlin, on this new creation.

By setting aside this second factor for his own use, Saint Sancho acquires a determinateness that he can counterpose to the remaining, abstract *caput mortuum* of “freedom”. Thus he arrives at the following new antitheses:

Freedom, the empty removal of alien power — Peculiarity, the actual possession of one’s own power.

Or, even:

Freedom, repulsion of alien power — Peculiarity, possession of one’s own power.

To show the extent to which Saint Sancho has juggled his own “power”, which he here counterposes to freedom, out of this same freedom and into himself, we do not intend to refer him to the materialists or communists, but merely to the *Dictionnaire de 1'académie,* where he will find that the word *liberté* is most frequently used in the sense of puissance. If, however, Saint Sancho should maintain that he does not combat “*liberté* “, but “*freedom*”, then he ought to consult Hegel on negative and positive freedom. As a German petty bourgeois, he might enjoy the concluding remark in this chapter.

The antithesis can also be expressed as follows:

Freedom, idealistic striving for riddance and the struggle against other-being	Peculiarity, *actual* riddance and pleasure in one’s own existence.

Having thus, by means of a cheap abstraction, *distinguished* peculiarity from freedom, Sancho pretends that he is only now beginning to analyse this difference and exclaims:

“What a difference there is between freedom and peculiarity!” (p. 207).

We shall see that, apart from the general antitheses, he has achieved nothing, and that peculiarity “in the ordinary sense” continues most amusingly to creep in side by side with this definition of peculiarity.

“In spite of the state of slavery, one can be inwardly free, although, again, only from various things, but not from everything, but the slave cannot be free from the whip, from the despotic mood, etc., of his master.”

"On the other hand, peculiarity is my whole essence and existence, it is I myself. I am free from that which I have got rid of; I am the owner of that which I have in my power or which I have mastered. I am my own at all times and under all circumstances, if only I know how to possess myself and do not abandon myself to others. I cannot truly want the state of being free, because I cannot ... achieve it; I can only wish for it and strive towards it, for it remains an ideal, a spectre. At every moment the fetters of actuality cut very deeply into my flesh. But I remain my own. Belonging as a feudal serf to some master, I think only of myself and of my own advantage; his blows, it is true, strike me: I am not free from them; but I endure them only for my own good, for example, in order to deceive him by an appearance of patience and to lull him into security or perhaps in order not to incur something worse by my defiance. But since I constantly have in mind myself and my own advantage" (while the blows retain possession of him and his back) "I seize on the first convenient opportunity" (i.e., he "wishes", he "strives" towards the first convenient opportunity, which, however, "remains an ideal, a spectre") "to crush the slave-owner. That I then become free from him and his whip is only a consequence of my previous egoism. It will, perhaps, he said here that even in the state of slavery I was free, namely 'in myself' or 'inwardly'; however, 'free in oneself' is not 'actually free', and 'inwardly' is not 'outwardly'. On the other hand, was myself, my own wholly and completely, both inwardly and outwardly. Under the domination of a cruel master, my body is not 'free' from the pain of torture and the lashes of the whip; but it is my bones that crack under torture, my muscles that twitch under the blows, and it is I who groan because my body suffers. The fact that I sigh and tremble proves that I still belong to myself, that I am my own" (pp. 207, 208).

Our Sancho, who here again acts the story-teller for the petty bourgeois and villagers, proves here that, despite the numerous drubbings he has already received in Cervantes, he has always remained "owner" of himself and that these blows belonged rather to his "peculiarity". He is "his own" "at all times and under all circumstances" *provided he knows how* to possess himself. Here, therefore, peculiarity is hypothetical and depends on his knowledge, by which term he understands a slavish casuistry. This knowledge later on becomes *thinking* as well, when he begins "to think" about himself and his "advantage" — this thinking and this imagined "advantage" being his imagined "property". It is further interpreted in the sense that he endures the blows "for his own good", where peculiarity once again consists in the *idea* of "good", and where he "endures" the bad in order not to become the "owner" of "something worse". Subsequently, knowledge is revealed also as the "owner" of the reservation about "the first convenient opportunity", hence of a mere *reservatio mentalis*, and, finally, as the "crushing" of the "slave-owner", in the anticipation of the idea, in which case he is the "owner" of this anticipation, whereas at present the slave-owner actually tramples him underfoot. While, therefore, he identifies himself here with his *consciousness,* which endeavours to calm itself by means of all kinds of maxims of worldly wisdom, in the end he identifies himself with his body, so that he is wholly "his own", outwardly as well as inwardly, so long as he still retains a spark of life, even if it is merely unconscious life. Such phenomena as the cracking of his "bones", the twitching of his muscles, etc., are phenomena which, when translated from the language of *unique* natural science into the language of pathology, can be produced with the aid of galvanism on his corpse, when freshly cut down from the gallows on which he hanged himself, as we saw above, and which can be produced even in a dead frog — these phenomena serve him here as proof that he is "wholly and completely" "both inwardly and outwardly" still "his own", that he still has control over himself. The very fact which demonstrates the power and peculiarity of the slave-owner, namely that it is precisely *he* who is flogged and not someone else, that it is precisely *his* bones that "crack", *his* muscles that twitch, without his being able to alter it — this very fact here serves our saint as proof of his own peculiarity and power. Thus, when he lies trussed up in the *spanso bocko"* [44] torture of Surinam, unable to move hand or foot, or any other of his limbs, and has to put up with everything done to him, in such circumstances his power and peculiarity do not consist in his being able to make use of his limbs, but in the fact that they are *his* limbs. Here once again he has saved his peculiarity by always considering himself as otherwise-determined — sometimes as mere consciousness, sometimes as an unconscious body (see the "*Phenomenology*").

At any rate, Saint Sancho "endures" his portion of blows with more dignity than actual slaves do. However often, in the interests of the slave-owners, missionaries may tell the slaves that they have to "endure" the blows "for their own good", the slaves are not taken in by such twaddle. They do not coldly and timidly reflect that they would otherwise "incur something worse", nor do they imagine that they "deceive the slave-owner by an appearance of patience". On the contrary, they scoff at their torturers, they jeer at the latter's impotence even to force them to humble themselves, and they in suppress every "groan" and every sigh, as long as the physical pain permits them to do so. (See Charles Comte, *Traité de legislation.*) They are therefore, neither "inwardly" nor "outwardly" their own "owners", but only the "owners" of their defiance, which could equally well be expressed by saying that they are neither "inwardly" nor "outwardly" "free", but are free only in one respect, namely that they are "inwardly" free from self-humiliation as they also show "outwardly". Insofar as "Stirner" suffers blows, he is the owner of the blows and thus free from being not beaten; and this freedom, this riddance, belongs to his peculiarity.

From the fact that Saint Sancho assumes that the reservation about running away at "the first convenient opportunity" is a special characteristic of peculiarity and sees in the "liberation" thus obtained "merely the consequence of his previous egoism" (*of his own* egoism, i.e., egoism in agreement with itself), it follows that he imagines that the insurgent Negroes of Haiti[45] and the fugitive Negroes of all the colonies wanted to free not *themselves,* but "man". The slave who takes the decision to free himself must already be superior to the idea that slavery is his "peculiarity". He must be "*free*" from this "*peculiarity*". The peculiarity" of an individual, however, can consist in his "*abandoning*" himself. For "one" to assert the opposite means to apply an "alien scale" to this individual.

In conclusion, Saint Sancho takes revenge for the blows he has received by the following address to the "owner" of his "peculiarity", the slave-owner:

"My leg is not 'free' from the blows of the master, but it is my leg, and it cannot be taken away. Let him tear it firm me and see whether he has possession of my leg! He will find in his hands nothing but the corpse of my leg, which is as little my leg as a dead dog is a dog" (p. 208).

But let him — Sancho, who imagines here that the slave-owner wants to have his living leg, probably for his own use — let him "see" what he still retains of his leg which "cannot be taken away". He retains nothing but the loss of his leg and has become the one-legged owner of his torn-out leg. If he has to labour at a treadmill eight hours every day, then it is *he* who in the course of time becomes an idiot, and idiocy will then be *his* "peculiarity". Let the judge who sentences him to this "see" whether he has still Sancho's brain "in his hands". But that will be of little help to poor Sancho.

"The first property, the first splendour has been won!"

After our saint, by means of these examples, which are worthy of an ascetic, has revealed the difference between freedom and peculiarity, at a considerable belletristical production cost, he quite unexpectedly declares on page 209 that

"between peculiarity and freedom there lies a still deeper gulf than the simple verbal difference".

This "deeper gulf" consists in the fact that the above definition of freedom is repeated with "manifold transformations" and "refractions" and numerous "episodical insertions". From the definition of "freedom" as "riddance" the questions arise: from what should people be free (p. 209), etc., disputes concerning this "from what" (ibid.) (here, too, as a German petty bourgeois, he sees in the struggle of actual interests only wrangling about the definition of this "from what", in which connection, of course, it appears very strange to him that the "citizen" does not wish to be free "from citizenship", page 210). Then the proposition is repeated that the removal of a barrier is the establishment of a new barrier, in the form that "the striving for a definite freedom always includes the aim of a new rule", page 210 (in which connection we learn that in the revolution the bourgeois was not striving for his own rule but for the "rule of law" — see above concerning liberalism); then follows the result that one does not wish to be rid of what "is wholly to one's liking, e.g., the irresistible glance of the beloved" (p. 211). Further on, it turns out that freedom is a "phantom" (p. 211), a "dream" (p. 212); then we learn by the way that the "voice of nature" can sometimes also become "peculiarity" (p. 213); on the other hand the "voice of God and conscience" is to be considered "devil's work", and the author boasts: "Such godless people" (who consider it the work of the devil) "do exist; how will you deal with them?" (pp. 213, 214). But it is not nature that should determine me, but I who should determine my nature, says the egoist in agreement with himself. And my conscience is also a "voice of nature". In this connection it also turns out that the animal "takes very correct steps" (p. 213). We learn further that "freedom is silent about what should happen after I have become free" (p. 215). (See "Solomon's Song of Songs") The exposition of the abovementioned "deeper gulf" is closed by Saint Sancho repeating the scene with the blows and this time expressing himself somewhat more clearly about peculiarity:

"Even when unfree, even bound by a thousand fetters, I nevertheless exist, and I exist not only just in the future, and in the hope, like freedom, but even as the most abject of slaves I am present" (p. 215).

Here, therefore, he counterposes *himself* and "*freedom*" as two persons, and peculiarity becomes mere existence, being present, and indeed the "most abject" presence. Peculiarity here is the simple registering of personal identity. Stirner, who in an earlier passage has already constituted himself the "secret police state", here sets himself up as the passport department. "By no means" should anything be lost" from "the world of human beings!" (See "Solomon's Song of Songs".)

According to page 218, one can also "give up" one's peculiarity through "submissiveness", "submission", although, according to the preceding, peculiarity cannot cease so long as one is *present* at all, even in the most "abject" or "submissive" form. And is not the most abject" slave the "most submissive"? According to one of the earlier descriptions of peculiarity, one can only "give up" one's peculiarity by giving up one's *life*.

On page 218, peculiarity as one aspect of freedom, as power, is once again set against freedom as riddance; and among the means by which Sancho pretends to protect his peculiarity, are mentioned "hypocrisy", "deception" (means which my peculiarity employs. because it had to "submit" to the conditions of the world), etc.,

"for the means that I employ are determined by what I am".

We have already seen that among these means the *absence* of any means plays a major role, as was evident also from his proceedings against the moon (see above "Logic").

Then, for a change, freedom is regarded as "*self-liberation", "*i.e., that I can only have as much freedom as I procure by my peculiarity", where the definition of freedom as *self-determination*, which occurs among all, and particularly German, ideologists, makes its appearance as peculiarity. This is then explained to us on the example of "sheen"; to whom it is of no use" at all "if they are given freedom of speech" (p. 220). How trivial is his conception here of peculiarity as self-liberation is evident if only from his repetition of the most hackneyed phrases about granted freedom, setting free, self-liberation, etc. (pp. 220, 221). The antithesis between freedom as riddance and peculiarity as the negation of this riddance is now also portrayed poetically:

"Freedom arouses your wrath against everything that you are not" (it is, therefore, *wrathful* peculiarity, or have choleric natures, e.g., Guizot, in Saint Sancho's opinion, no "peculiarity"? And do I not enjoy myself in wrath against others„), "egoism calls on you to *rejoice* over yourself, to delight in yourself " (hence egoism is freedom which rejoices; incidentally, we have already become acquainted with the joy and self-enjoyment of the egoist in agreement with himself). "Freedom is and remains a longing" (as though longing were not also a peculiarity, the self-enjoyment of individuals of a particular nature, especially of Christian-German individuals — and should this longing "be lost"?). "Peculiarity is a reality which *of itself* abolishes all the non-freedom which is an impediment and blocks your own path" (in which case, then, until non-freedom is abolished my peculiarity is a *blocked* peculiarity. It is characteristic again of the German petty bourgeois that for him all barriers and obstacles disappear "of themselves", since he never lifts a finger to achieve it, and by habit he turns those barriers which do not disappear "of themselves" into his peculiarity. It may be remarked in passing that peculiarity appears here as an acting *person*, although it is later demoted to a mere *description* of its owner) (p. 215).

The same antithesis appears again in the following form:

"As being your own, you are in actuality rid of everything, and what remains with you, you have yourself accepted, it is your choice and option. One who is his own is born free, one who is free on the other hand is only one who desires freedom."

Nevertheless Saint Sancho "admits" on page 252

"that each is born as a human being; hence in this respect the newborn children are equal".

What you as being your own have not "rid yourself of" is "your choice and option", as in the case of the beatings of the slave mentioned above. — Banal paraphrase! — Here, therefore, peculiarity is reduced to the fantastic idea that Saint Sancho has voluntarily accepted and retained everything from which he has not "rid" himself, e.g., hunger when he has no money. Apart from the many things, e.g., dialect, scrofula, haemorrhoids, poverty, one-leggedness, forced philosophising imposed on him by division of labour, etc., etc. — apart from the fact that it in no way depends on him whether he "accepts" these things or not; all the same, even if for an instant we accept his premises, he has only the choice between definite things which lie within his province and which are in no way posited by his peculiarity. As an Irish peasant, for example, he can only choose to eat potatoes or starve, and he is not always free to make even this choice. In the sentence quoted above one should note also the beautiful apposition, by which, just as in jurisprudence, "acceptance" is directly identified with "choice" and "option". Incidentally, it is impossible to say what Saint Sancho means by one who is "born free", whether in the context or outside it. And is not a feeling instilled into him, his feeling accepted by him? And do we not learn on pages 84, 85, that "instilled" feelings are not "ones own" feelings? For the rest, it turns out here, as we have already seen in connection with Klopstock (who is put forward here as an example), that "one's own" behaviour by no means coincides with individual behaviour, although for Klopstock Christianity seems to have been "quite right" and in no way to have "obstructively blocked his path".

"One who is his own does not need to free himself, because from the outset he rejects everything except himself.... Although he remains in the confines of childish reverence, he already works to 'free' himself from this enthralment."

Since one who is his own does not *need* to free himself, already as a child he works to free himself, and all this because, as we have seen, he is one who is "*born free*". "Although he remains in the confines of childish reverence" he already reflects without any restraint, namely in his own fashion, about this his own enthralment. But this should not surprise us: we already saw at the beginning of the Old Testament what a prodigy the egoist in agreement with himself was.

"Peculiarity works in the little egoist and secures him the desired 'freedom'."

It is not "Stirner" who lives, it is "peculiarity" that lives, "works" and "secures" in him. Here we learn that peculiarity is not a *description* of one who is his own, but that one who is his own is merely a *paraphrase* of peculiarity.

As we have seen, "riddance" at its climax was riddance from one's own self, self-denial. We saw also that on the other hand he put forward "peculiarity" as the assertion of self, as self-interestedness. But we have seen likewise that this self-interestedness itself was again self-denial.

For some time past we have been painfully aware that "the holy" was missing. But we rediscover it suddenly, on page 224, at the end of the section on peculiarity, where it stands quite bashfully and proves its identity by means of the following new turn of expression:

"My relation to something which I selfishly carry on" (or do not carry on at all) "is different from my relation to something which I unselfishly serve" (or which I carry on).

But Saint Max is not satisfied with this remarkable piece of tautology, which he "accepted" from "choice and option"; there suddenly reappears the long forgotten "one", in the shape of the night watchman who establishes the identity of the holy, and declares that he

"could put forward the following distinguishing mark: against the former I can sin or commit a sin" (a remarkable tautology!), "the other I can only lose by my folly, push away from myself, deprive myself of it, i.e., do something stupid" (it follows that he can lose himself by his folly, can deprive himself of himself, can be deprived of himself — can be deprived of life). "Both these points of view are applicable to freedom of trade, because it" is partly taken for the holy and partly not so taken, or, as Sancho himself expresses it more circumstantially, "because it is partly regarded as a freedom which can be granted or withdrawn depending on circumstances, and partly as a freedom which should be regarded as holy under all circumstances" (pp. 224, 225).

Here again Sancho reveals his "peculiar" "penetration" into the question of freedom of trade and protective tariffs. He is herewith given the "vocation" of pointing out just one single case where freedom of trade was regarded as "holy" 1) *because* it is a "*freedom",* and 2) "*under all circumstances*". The holy comes in useful for all purposes. After peculiarity, by means of logical antitheses and the phenomenological "being-also-otherwise-determined", has been *constructed*, as we have seen, from a "freedom" previously trimmed up for the purpose — Saint Sancho meanwhile having "dismissed" everything that happened to suit him (e.g., beatings) into peculiarity, and whatever did not suit him into freedom — we learn finally that all this was still not true peculiarity.

"Peculiarity," it is stated on page 225, "is not at all an idea, such as freedom, etc., it is only a description — of the owner."

We shall see that this "description of the owner" consists in negating freedom in the three refractions which Saint Sancho ascribes to it — liberalism, communism and humanism — comprehending it in its truth and then calling this process of thought, which is extremely simple according to advanced logic, the description of a real ego.

The entire chapter about peculiarity boils down to the most trivial self-embellishments by means of which the German petty bourgeois consoles himself for his own impotence. Exactly like Sancho, he thinks that in the struggle of bourgeois interests against the remnants of feudalism and absolute monarchy in other countries everything turns merely on a question of principles, on the question of *from what* "Man" should free himself. (See also above on political liberalism.) Therefore in freedom of trade he sees only a freedom and, exactly like Sancho, expatiates with a great air of importance about whether "Man" ought to enjoy freedom of trade "under all circumstances' or not. And when, as is inevitable in such conditions, his aspirations for freedom suffer a miserable collapse, then, again like Sancho, he consoles himself that "Man", or he himself, cannot "become free from everything", that freedom is a highly indefinite concept, and that even Metternich and Charles X were able to appeal to "true freedom" (p. 210 of "the book"; and it need only be remarked here that it is precisely the reactionaries, especially the Historical School and the Romanticists[46] who — again just like Sancho — reduce true freedom to peculiarity, for instance, to the peculiarity of the Tyrolean peasants, and in general, to the peculiar development of individuals, and also of localities, provinces and estates). — The petty bourgeois also consoles himself that as a German, even if he is not free, he finds compensation for all sufferings in his own indisputable peculiarity. Again like Sancho, he does not see in freedom a power that he is able to obtain and therefore declares his own impotence to be power.

What the ordinary German petty bourgeois whispers to himself as a consolation, in the quiet depths of his mind, the Berliner trumpets out loudly as an ingenious turn of thought. He is proud of his trashy peculiarity and his peculiar trashiness.

5. The Owner

For the way in which the "owner" is divided into three refractions": "my power", "my intercourse" and my self-enjoyment", see "The Economy of the New Testament". We shall pass directly to the first of these refractions.

A. My Power

The chapter on power has in its turn a trichotomous structure in that it treats of: 1) right, 2) law, and 3) crime. In order to conceal this trichotomy, Sancho resorts very frequently to the "episode". We give here the entire content in tabular form, with the necessary episodical insertions.

I. Right

A. Canonisation in General

Another example of the holy is right.

Right is not ego

= not my right

= alien right

= existing right.

All existing right	= alien right = right *of others* (not my right) = right given by others = (right, which one gives me, which is meted out to me) (pp. 244, 245).	The Holy

Note No. 1. The reader will wonder why the conclusion of equation No. 4 suddenly appears in equation No. 5 as the antecedent of the conclusion of equation No. 3, so that in the place of "right", "all existing right" suddenly appears as the antecedent. This is done to create the illusion that Saint Sancho is speaking of *actual*, existing right which, however, he by no means intends to do. He speaks of right only insofar as it is represented to be a holy "predicate".

Note No. 2. After right has been determined as "alien right", it can be given any names you like, such as "Sultan's right", "people's right", etc., depending on how Saint Sancho wishes to define the alien from whom he receives the right in question.

This allows Sancho to go on to say that "alien right is given by nature, God, popular choice, etc." (p. 250), hence "not by me". What is naive is only the method by which our saint through the use of synonymy tries to give some semblance of development to the above simple equations.

"If some blockhead considers me right" (what if he himself is the blockhead who considers him right?). "I begin to be mistrustful of my right" (it would be desirable in "Stirner's" interests that this were so). "But even if a wise man considers me right, this still does not mean that I am right. Whether I am right is quite independent of my being acknowledged right by fools or wise men. Nevertheless, up to now we have striven for this right. We seek right and to this end we appeal to the court.... But what do I seek from this court? I seek Sultan's right, not my right, I seek alien right ... before the high court of censorship I seek, therefore, the right of censorship" (pp. 244, 245).

One has to admire the cunning use of synonymy in this masterly proposition. Recognition of right in the ordinary conversational sense is identified with recognition of right in the juridical sense. Even more worthy of admiration is the faith capable of moving mountains in the idea that one "appeals to the court" for the sake of the pleasure of vindicating one's right — a faith which explains that courts are due to litigiousness.

Notable, finally, is also the craftiness with which Sancho — as in the case of equation No. 5 above — smuggles in, *in advance,* the more concrete name, in this case "Sultan's right", in order to be able more confidently later to bring in his universal category of "alien right".

Alien right =not my right.

= not to be right
My being right according to alien right = *to have no right*
= to be *rightless* (p. 247).

= not your right
My right
= *your wrong.*

Your right = my wrong.

Note. "You desire to be in the right against others" (it should read: to be in Your right). "You cannot be this, in relation to them you will always remain in the 'wrong', for they would not be your opponents if they were not also in 'their' right. They will always 'consider' You 'wrong..... if You remain on the basis of right, then you remain on the basis of litigiousness" (pp. '248, 253).

“Let us in the meantime consider the subject from yet another aspect.” Having thus given adequate evidence of his knowledge of right. Saint Sancho can now restrict himself to defining right once again as the holy, in this connection repeating some of the epithets previously given to the holy with the addition of the word “right”.

“Is not tight a religious concept, i.e., something holy?” (p. 247).

"Who can ask about ‘right’ if he does not have a religious standpoint?” (ibid.).

"Right ‘in and for itself’. Therefore without relation to me? ‘Absolute right'! Therefore separated from me. — Something ‘being in and for itself'! — An Absolute! An eternal right, like an eternal truth” — the holy (p. 270).

"You recoil in horror before others because You imagine You see by their side the spectre of right"’ (p. 253).

"You creep about in order to win the apparition over to Your side” (ibid.).

"Right is a whimsy, dispensed by an apparition” (the synthesis of the two propositions given above) (p. 276).

"Right is ... a fixed idea” (p. 270).

"Right is spirit ...” (p. 244).

"Because right can be dispensed only by a spirit” (p. 275).

Saint Sancho now expounds again what he already expounded in the Old Testament, viz., what a “fixed idea” is, with the only difference that here “right” crops up everywhere as another example” of the “fixed idea”.

“Right is originally my thought, or it” (!) “has its origin in me. But if it’ has escaped from me” (in common parlance, absconded), “if the ‘word’ has been uttered, then it has become flesh” [cf. John 1:14] (and Saint Sancho can cat his fill of it), “a fixed idea” — for which reason Stirner’s whole book consists of “fixed ideas”, which have “escaped” from him, but have been caught by us and confined in the much-praised “house for the correction of morals”. “Now I can no longer get rid of the idea” (after the idea has got rid of him!); “however I twist and turn, it confronts me.” (The pigtail, which hangs down behind him.) “Thus, people have been unable to regain control of the idea of ‘right’ that they themselves have created. Their creature runs away with them. That is absolute right, which is absolved” (o synonymy!) “and detached from me. Since we worship it as Absolute, we cannot devour it again and it deprives us of our creative power; the creation is more than the creator, it exists in and for itself. Do not allow right to run about freely any longer...... (We shall already in this sentence follow this advice and chain it up for the time being) (p. 270).

Having thus dragged right through all possible ordeals of sanctification by fire and water and canonised it, Saint Sancho has thereby destroyed it.

"With absolute right, right itself disappears, at the same time the domination of the concept of right" (hierarchy) "is wiped out. For one should not forget that concepts, ideas, and principles have up to now ruled over us and that among these rulers the concept of right or the concept of justice has played one of the most important parts" (p. 276).

That relations of right here once again appear as the domination of the *concept* of right and that Stirner kills right simply by declaring it a concept, and therefore the holy, is something to which we are already accustomed; on this see "Hierarchy". Right [according to Stirner] does not arise from the material relations of people and the resulting antagonism of people against one another, but from their struggle against their own concept, which they should "get out of their heads". See "Logic".

This last form of the canonisation of right comprises also the following three notes:

Note 1.

"So long as this alien right coincides with mine, I shall, of course, find the latter also in it" (p. 2451).

Saint Sancho might ponder awhile over this proposition. Note 2.

"If once an egoistic interest crept in, then society was corrupted ... as is shown, for example, by the Roman society with its highly developed civil law" (p. 278).

According to this, Roman society from the very outset must have been *corrupted* Roman society, since egoistic interest is manifested in the Ten Tables [47] even more sharply than in the "highly developed civil law" of the imperial epoch. In this unfortunate reminiscence from Hegel, therefore, civil law is considered a symptom of egoism, and not of the holy. Here, too, Saint Sancho might well reflect on the extent to which civil *law* [*Privatrecht*] is linked with private *property* [*Privateigentum*] and to what extent civil law implies a multitude of other legal relations (cf. "Private Property, State and Right) about which Saint Max has nothing to say except that they are the holy. Note 3.

"Although right is derived from the concept, nevertheless it only comes into existence because it serves men's needs."

So says Hegel (*Rechtsphilosophie* par 209, Addition) from whom our saint derived the hierarchy of concepts in the modern world. Hegel, therefore, explains the *existence* of right from the empirical *needs* of individuals, and rescues the *concept* only by means of a simple assertion. One can see how infinitely more materialistically Hegel proceeds than our "corporeal ego", Saint Sancho.

B. Appropriation by Simple Antithesis

a) The right of man	My right.
b) Human right	Egoistic right.
c) Alien right = to be authorised by others	My right = to be authorised by myself.
d) Right is that which man considers right	Right is that which I consider right.

"This is egoistic right, i.e., I consider it right, therefore, it is right" (passin; the last sentence is on p. 25 1).

Note 1.

"I am authorised by myself to commit murder if I do not forbid myself to do so, if I myself am not afraid of murder as a wrong" (p. 249).

This should read: I *commit murder* if I do not forbid myself to do so, if I am not *afraid* of murder. This whole proposition is a boastful expansion of the second equation in antithesis c, where the word authorised" has lost its meaning. Note 2.

"I decide whether it is right within me; outside me, no right exists" (p. 249). — "Are we what is in us? No, no more than we are what is outside us.... Precisely because we are not the spirit which dwells in us, for that very reason we had to transfer it outside us ... think of it as existing outside us ... in the beyond" (p. 43).

Thus, according to his own statement on page 43, Saint Sancho has again to transfer the right "in him" to "outside himself", and indeed "into the beyond". But if at some stage he wants to appropriate things for himself in this fashion, then he can transfer "into himself" morality, religion, everything "holy", and decide whether "in him" it is the moral, the religious, the holy — "outside him there exists no" morality, religion, holiness — in order thereupon to transfer them, according to page 43, again outside himself, into the beyond. Thereby the "restoration of all things" [Mark 9:12] according to the Christian model is brought about. Note 3.

"Outside me no right exists. If I consider it right then it is right. It is possible that it is still not on that account right for others" (p. 249).

This should read: If I consider it right then it is right for me, but it is still not right for others. We have by now had sufficient examples of the sort of synonymical "flea-jumps" Saint Sancho makes with the word "right". The right and right, legal "right", moral "right", what he considers "right", etc. — all are used higgledy-piggledy, as it suits him. Let Saint Max attempt to translate his propositions about right into another language; his nonsense would then become fully apparent. Since this synonymy was dealt with exhaustively in "The Logic [of the New Wisdom]", we need here only refer to that section. The proposition mentioned above is also presented in the following three "transformations":

A. "Whether I am right or not, of that there can be no other judge than I myself. Others can judge and decide only whether they agree with my right and whether it exists as right also for them" (p. 246).

B. "it is true that society wants each person to attain his right, but only light sanctioned by society, social right, and not actually his right" (it should read: "what is his" — "right" is a quite meaningless word here. And then he continues boastfully:) "I, however, give myself, or take for myself, right on my own authority.... Owner and creator of my right" ("creator" only insofar as he first declares right to be his thought and then asserts that he has taken this thought back into himself), "I recognise no other source of right but myself — neither God, nor the state, nor nature, nor man, neither divine nor human right" (p. 269).

C. "Since human right is always something given, in reality it always amounts to the right which people give to, i.e., concede, one another" (p. 251).

Egoistical right, on the other hand, is the right which *I give myself* or *take*.

However, "let us say in conclusion, it can be seen" that in Sancho's millennium egoistical right, about which people "*came to terms*" with each other, is not so very different from that which people "*give to*" or "*concede*" one another.

Note 4.

"In conclusion, I have now still to take back the half-and-half mode of expression which I desired to use only while I was delving into the bowels of right and allowed at least the word to remain. In point of fact, however, together with the concept the word loses its meaning. What I called my right, is no longer right at all" (p. 275).

Everyone will see at a glance why Saint Sancho allowed the "*word*" right to remain in the above antitheses. For as he dces not speak at all about the *content* of right, let alone criticise it, he can only by retaining the *word* right make it appear that he is speaking about right. If the word right is left out of the *anti*thesis, all that it contains is "my" and the other grammatical forms of the first person pronoun. The content was always introduced only by means of examples which, however, as we have seen, were nothing but tautologies, such as: if I commit murder, then I commit murder, etc., and in which the words "right", "authorised", etc., were introduced only to conceal the simple tautology and give it some sort of connection with the antitheses. The *synonymy*, too, was intended to create the appearance of dealing with some sort of content. Incidentally, one can see at once what a rich source of bragging this empty chatter about right provides.

Thus, all the “delving into the bowels of right” amounted to this, that Saint Sancho “made use of a half-and-half mode of expression” and “allowed at least the *word* to remain”, because he was unable to say anything about the *subject itself.* If the antithesis is to have any meaning, that is to say, if “Stirner” simply wanted to demonstrate in it his repugnance to right, then one must say rather that it was not he who “delved into the bowels of right”, but that right “delved” into his bowels and that he merely recorded the fact that right is not to his liking. “Keep this right uncurtailed”, Jacques le bonhomme!

To introduce some sort of content into this void, Saint Sancho has to undertake vet another logical manoeuvre, which with great “virtuosity” he thoroughly shuffles together with canonisation and the simple antithesis, and so completely masks with numerous episodes that the German public and German philosophers, at any rate, were unable to see through it.

C. Appropriation by Compound Antithesis

“Stirner” now has to introduce an empirical definition of right, which he can ascribe to the individual, i.e., he has to recognise something else in right besides holiness. In this connection, he could have spared himself all his clumsy machinations, since, starting with Machiavelli, Hobbes, Spinoza, Bodinus and others of modern times, not to mention earlier ones, might has been represented as the basis of right. Thereby the theoretical view of politics was freed from morality, and apart from the postulate of an independent treatment of politics nothing was accepted. Later, in the eighteenth century in France and in the nineteenth century in England, all right was reduced to civil law (which Saint Max does not discuss) and the latter to a quite definite power, the power of the owners of private property. Moreover, the matter was by no means left at a mere phrase.

Thus Saint Sancho draws the definition of *might* from *right* and explains it as follows:

“We are in the habit of classifying states according to the various ways in which the ‘supreme power’ is divided ... hence, the supreme power! Power over whom, Over the individual.... The state uses force ... the behaviour of the state is exercise of force, and it calls its force right.... The collective as a whole ... has a power which is called rightful, i.e., which is right” (pp. 259, 260).

Through “our” “habit”, our saint arrives at his longed-for power and can now “look after” [in German a pun on pflegen, which can mean to be accustomed to and to look after] himself.

Right, the might of man — might, my right.

Intermediate equations:

1=To be authorised = to be empowered. To authorise oneself = to empower oneself.

Antithesis:

To be authorised by man — to be empowered by me.

First antithesis:

Right, might of man — Might, my right

now becomes converted into:

Right of man — Might of me, My might,

because in the thesis right and might are identical, and in the antithesis the "half-and-half mode of expression" has to be "taken back", since right, as we have seen, has "lost all meaning".

Note 1. Examples of bombastic and boastful paraphrases of the above antitheses and equations:

"What You have the power to be, You have the right to be." "I derive all right and all authority from myself, I am authorised to do everything which I have the power to do." — "I do not demand any right, and therefore I need recognise none. What I can obtain for myself by force, I obtain for myself, and what I cannot obtain by force, to that I have no right either, etc. — It is a matter of indifference to me whether I am authorised or not; if only I have the power, then I am already empowered as a matter of course and do not need any other power or authority" (pp. 248, 275).

Note 2. Examples of the way in which Saint Sancho expounds might as the real basis of right:

"Thus, 'the communists' say" (how on earth does "Stirner" know what the communists say, since he has never set eves on anything concerning them except the Bluntschli report,' Becker's Volksphilosophie and a few other things?): "Equal work gives people the right to equal enjoyment.... No, equal work does not give you this right, only equal enjoyment gives you the right to equal enjoyment. Enjoy, and you are entitled to enjoyment.... if You take enjoyment, then it is your right; if, on the other hand, you only yearn for it, without seizing it, it will remain as before the 'established right' of those who have the privilege of enjoyment. It is their right, just as it would become your right, by your seizing it" (p. 250).

Compare what is here put into the mouth of the communists with what was previously said about "communism". Saint Sancho again presents the proletarians here as a "closed society", which has only to take the decision of "seizing" in order the next day to put a summary end to the entire hitherto existing world order. But in reality the proletarians arrive at this unity only through a long process of development in which the appeal to their right also plays a part. Incidentally, this appeal to their right is only a means of making them take shape as "they", as a revolutionary, united mass. As for the above proposition itself, from start to finish it is a brilliant example of tautology, as is at once clear if one omits both might and right, which can be done without any harm to the content. Secondly, Saint Sancho himself distinguishes between personal and material property, [*vermögen*] thereby making a distinction between enjoying and the power to enjoy. I may have great *personal* power (capacity) of enjoyment without necessarily having the corresponding *material* power (money, etc.). Thus my actual "enjoyment" still remains hypothetical.

"That the child of royalty sets himself above other children," continues our school-master, using examples suitable for a child's book, "is already his act, one which ensures his superiority, and that other children recognise and approve this act is their act, which makes them deserving of being subjects" (p. 250).

In this example, the social relation in which the royal child stands to other children is regarded as the power and indeed as the *personal* power of the royal child, and as the impotence of other children. If the fact that other children allow themselves to be commanded by the royal child is regarded as the "*act*" of the other children, this proves at most that they are egoists. "Peculiarity is at work in the little egoists" and induces them to exploit the royal child, to extract an advantage from him.

"It is said" (i.e., Hegel said) "that punishment is the right of the criminal. But impunity is equally his right. If he succeeds in his undertakings, he gets his right, and if he fails it equally serves him right. If someone with reckless courage puts himself in danger and is killed, we say: it serves him right, he asked for it. But if he overcomes the danger, i.e., if his power is victorious, it appears he is also right. If a child plays with a knife and cuts himself, it serves him right; if he does not cut himself, that is also all right. Therefore it serves the criminal right if he suffers the penalty he risked; why did he take the risk, knowing the possible consequences?" (p. 255).

in the concluding words of the last sentence, where the criminal is asked why he took the risk, the school-masterish nonsense of the whole passage is latent. Whether it serves a criminal right if on burgling a house he falls down and breaks his leg, or a child who cuts himself all these important questions, with which only a man like Saint Sancho is capable of occupying himself, yield only the result that here *chance* is declared to be my power. Thus, in the first example it was my action that was "my power", in the second example it was social relations independent of me, in the third it was chance. But we have already encountered these contradictory definitions in connection with peculiarity. Between the above childish examples Sancho inserts the following amusing little intermezzo:

"For otherwise right would be a humbug. The tiger who attacks me is right and I, who kill it, am also right. I am protecting against it not my right, but myself" (p. 251).

In the first part of this passage Saint Sancho sets himself in a relation of right to the tiger, but in the second part it occurs to him that basically no relation of right is involved at all. *For that reason* "right" appears to "be a humbug". The right of "Man" merges into the right of the "Tiger".

This concludes the criticism of right. Long after having learned from hundreds of earlier writers that right originated from force, we now learn from Saint Sancho that "right" is "the power of man". Thus he has successfully eliminated all questions about the connection between right and *real* people and their relations, and has established his antithesis. He restricts himself to abolishing right in the form in which he posits it, namely, as the holy, i.e., he restricts himself to abolishing the holy and leaving right untouched.

This criticism of right is embellished with a host of episodes — all sorts of things which people are "in the habit" of discussing at Stehely's between two and four in the afternoon.

Episode 1. "The right of man" and "*established right"*.

"When the revolution made 'equality' into a 'right', it [the revolution] fled into the religious sphere, into the domain of the holy, the ideal. Therefore a struggle has been waged ever since over the holy, inalienable rights of man. Quite naturally and with equal justification, the 'established right of the existing' is asserted against the eternal right of man; right against right, and of course each of these condemns the other as a wrong. Such has been the dispute over right since the revolution" (p. 248).

Here Saint Sancho first of all repeats that the rights of man are "the holy" and that *therefore* a struggle over the rights of man has been waged ever since. Thereby he only proves that the material basis of this struggle is still, for him, holy, i.e., alien.

Since the "right of man" and "established right" are both rights", they are "equally justified" and here in fact "justified" in the *historical* sense. Since both are "rights" in the *legal* sense, they are "equally justified" in the *historical* sense. In this way one can dispose of everything in the shortest space of time without knowing anything about the matter. Thus, for example, it can be said of the struggle over the Corn Laws in England: "quite naturally and with equal justification" rent, which is also profit (gain), is "asserted" against the profit (gain) [of the manufacturers], gain against gain, and "of course each of these decries the other. Such has been the struggle" over the Corn Laws in England since 1815.[48]

Incidentally, Stirner might have said from the outset: existing right is the right of man, human right. In certain circles one is also "in the habit" of calling 't "established right". Where then is the difference between the "right of man" and "established right"?

We already know that alien, holy right is what is given to me by others. But since the rights of man are also called natural, innate rights, and since for Saint Sancho the name is the thing itself, it follows that they are rights which are mine by nature, i.e., by birth.

But "established rights amount to the same thing, namely to nature, which gives me a right, that is to birth and, furthermore, to inheritance", and so on. "I am born as a man is equivalent to saying: I am born as a king's son"

This is on pages 249, '50, where Babeuf is reproached for not having had this dialectical talent for dissolving differences. Since under all circumstances", the "ego" is "also" man, as Saint Sancho later concedes, and therefore has the benefit "also" of what it has as man, just as the ego, for instance, as a Berliner has the benefit of the Berlin Tiergarten,' so "also" the ego has the benefit of the right of man "under all circumstances". But since he is by no means born a "king's son" "under all circumstances", he by no means has the benefit of "established right" "under all circumstances". In the sphere of right, therefore, there is an essential difference between the "right of man" and "established right". If it had not been necessary for Saint Sancho to conceal his logic it "should have been said here": After I have, in my opinion, dissolved the concept of right, in the way in which I am generally "in the habit" of dissolving concepts, the struggle over these two special rights becomes a struggle within a concept which, in my opinion, has been dissolved by me, and "therefore" does not need to be touched upon any further by me.

For greater thoroughness Saint Sancho could have added the following new turn of expression: *The right of man* too is acquired, hence *well acquired,* and *well-acquired* [i.e., established] *right* is the human right possessed by men, *the right of man.*

That such concepts, if they are divorced from the empirical reality underlying them, can be turned inside-out like a glove [Shakespeare, Twelfth Night, Act III, Scene 1] has already been thoroughly enough proved by Hegel, whose use of this method, as against the abstract ideologists, was justified. Saint Sancho, therefore, has no need to make it appear ridiculous by his own "clumsy" "machinations".

So far established right and the right of man "have amounted to *the same thing*", so that Saint Sancho could reduce to nothing a struggle that exists outside his mind, in history. Now our saint proves that he is as keen-witted in drawing distinctions as he is all-powerful in heaping everything together, in order to be able to bring about a new terrible struggle in the "creative nothing" of his head.

"I am also ready to admit" (magnanimous Sancho) "that everyone is born as a human being" (hence, according to the above-mentioned reproach against Babeuf, also as a "king's son"), "hence, the newly born are in this respect equal to one another ... only because as Yet they reveal themselves and act as nothing but mere children of men, naked little human beings." On the other hand, adults are the "children of their own creation". They "possess more than merely innate rights, they have acquired rights".

(Does Stirner believe that the infant emerged from the mother's womb without any act of his own, an act by which he *acquired* the right" to be outside the mother's womb; and does not every child from the very beginning reveal himself and act as a "unique" child?)

"What a contradiction, what a battlefield! The old battle of innate rights and established rights!" (p. 252).

What a battle of bearded men against babes!

Incidentally, Sancho speaks against the rights of man only because "in recent times" it has again become "customary" to speak against them. In fact he has "acquired" these innate rights of man. In connection with peculiarity we already met the man who is "born free"; there Sancho made peculiarity the innate right of man, because merely by being born he revealed himself as being free and acted as such'. Furthermore: "Every ego is already from birth a criminal against the state", whereby a crime against the state becomes an innate right of man, and the child already commits a crime against something that does not yet exist for him, but for which he exists. Finally, "Stirner" speaks further on about "*innately* limited intellects", "*born* poets", "*born* musicians", etc. Since here the power (musical, poetic *resp.* limited *ability*) is innate, and right = power, one sees how "Stirner" claims for the "ego" the innate rights of man, although this time equality does not figure among these rights.

Episode 2. Privileges and *equal rights*. Our Sancho first of all transforms the struggle over privilege and equal right into a struggle over the mere "*concepts"* privileged and equal. In this way he saves himself the trouble of having to know anything about the medieval mode of production, the political expression of which was privilege, and the modern mode of production, of which *right* as such, *equal right*, is the expression, or about the relation of these two modes of production to the legal relations which correspond to them. He can even reduce the two above-mentioned "concepts" to the still simpler expression: equal and unequal, and prove that one and the same thing (e.g., other people, a dog, etc.) may, according to circumstances, be a matter of indifference i.e., of equanimity,, equality, or it may not be a matter of indifference — i.e., it may be different, unequal, preferred, etc., etc.

"Let the brother of low degree rejoice in that he is exalted." (Saint-Jaques le bonbomme [James] 1:9)

II. Law

Here we must disclose to the reader a great secret of our saint, viz., that he begins his whole treatise about right with a general explanation of right, which "escapes" from him so long as he is speaking about right, and which he is only able to recapture when he begins to speak about something totally different, namely — law. Then the gospel called out to our saint: judge not, that ye be not judged [Matthew 7:1] — and he opened his mouth and taught, saying:

"Right is the spirit of society. " (But society is the holy). "If society has a will, then this will is indeed right: society exists only thanks to right. But since it exists only thanks to the fact" (not thanks to right, but only thanks to the fact) "that it exercises its domination over individuals, so right is its dominant will" (p. 244).

That is to say: "*right* ... is ... has ... then ... indeed ... exists only since ... exists only thanks to the fact ... that ... so ... *dominant will*". This passage is Sancho in all his perfection. This passage "escaped" at that time from our saint because it was not suitable for his theses, and has now been partially recaptured because it is now partially suitable again.

"States endure so long as there is a dominant will and this dominant will is regarded as equivalent to one's own will. The will of the ruler is law" (p. 256).

1=The dominant will of society = right

Dominant will = law

Right = law.

"Sometimes", i.e., as the trade mark of his "treatise" about law, there will still turn out to be a distinction between right and law, a distinction which — strange to say — has almost as little to do with his treatise" about law as the definition of right which "escaped" from him has to do with the "treatise" about "right":

"But what is right, what is considered legitimate in a society is also given a verbal expression — in law" (p. 255),

This proposition is a "clumsy" copy of Hegel:

"That which is lawful is the source of the knowledge of what is right or, properly, what is legitimate."

What Saint Sancho calls "receiving verbal expression", Hegel also calls: "posited", "known", etc., *Rechtsphilosophie,* par. 211 et seq.

It is very easy to understand why Saint Sancho had to exclude right as the "will" or the "dominant will" of society from his "treatise" about right. Only to the extent that *right* was defined as man's *power* could he take it back into himself as *his power.* For the sake of his antithesis, therefore, he had to hold fast to the materialistic definition of "power" and let the idealistic definition of "*will*" "escape". Why, when speaking of "law", he now recaptures "will" we shall understand in connection with the antitheses about law.

— Material Life the Basis of the State —

In actual history, those theoreticians who regarded *might* as the basis of right were in direct contradiction to those who looked on *will* as the basis of right — a contradiction which Saint Sancho could have regarded also as that between realism (the child, the ancient, the Negro, etc.) and idealism (the youth, the modern, the Mongol, etc.). If power is taken as the basis of right, as Hobbes, etc., do, then right, law, etc., are merely the symptom, the expression of *other* relations upon which state power rests. The material life of individuals, which by no means depends merely on their "will", their mode of production and form of intercourse, which mutually determine each other — this is the real basis of the state and remains so at all the stages at which division of labour and private property are still necessary, quite independently of the *will* of individuals. These actual relations are in no way created by the state power; on the contrary they are the power creating it, The individuals who rule in these conditions — leaving aside the fact that their power must assume the form of the *state* — have to give their will, which is determined by these definite conditions, a universal expression as the will of the state, as law, an expression whose content is always determined by the relations of this class, as the civil and criminal law demonstrates in the clearest possible way. Just as the weight of their bodies does not depend on their idealistic will or on their arbitrary decision, so also the fact that they enforce their own will in the form of law, and at the same time make it independent of the personal arbitrariness of each individual among them, does not depend on their idealistic will. Their personal rule must at the same time assume the form of average rule. Their personal power is based on conditions of life which as they develop are common to many individuals, and the continuance of which they, as ruling individuals, have to maintain against others and, at the same time, to maintain that they hold good for everybody. The expression of this will, which is determined by their common interests, is the law. It is precisely because individuals who are independent of one another assert themselves and their own will, and because on this basis their attitude to one another is bound to be egoistical, that self-denial is made necessary in law and right, self-denial in the exceptional case, and self-assertion of their interests in the average case (which, therefore, not *they*, but only the "egoist in agreement with himself" regards as self-denial). The same applies to the classes which are ruled, whose will plays just as small a part in determining the existence of law and the state. For example, so long as the productive forces are still insufficiently developed to make competition superfluous, and therefore would give rise to competition over and over again, for so long the classes which are ruled would be wanting the impossible if they had the "will" to abolish competition and with it the state and the law. Incidentally, too, it is only in the imagination of the ideologist that this "will" arises before relations have developed far enough to make the emergence of such a will possible. After relations have developed sufficiently to produce it, the ideologist is able to imagine this will as being purely arbitrary and therefore as conceivable at all times and under all circumstances.

Like right, so crime, i.e., the struggle of the isolated individual against the predominant relations, is not the result of pure arbitrariness. On the contrary, it depends on the same conditions as that domination. The same visionaries who see in right and law the domination of some independently existing general will can see in crime the mere violation of right and law. Hence the state does not exist owing to the dominant will, but the state, which arises from the material mode of life of individuals, has also the form of a dominant will. If the latter loses its domination, it means that not only the will has changed but also the material existence and life of the individuals, and only for that reason has their will changed. It is possible for rights and laws to be "inherited", [paraphrase of a passage from Goethe's Faust, 1. Teil, 2. "Studierzimmerszene", where Mephistopheles says: "Laws and rights are inherited like an eternal malady"] but in that case they are no longer dominant, but nominal, of which striking examples are furnished by the history of ancient Roman law and English law. We saw earlier how a theory and history of pure thought could arise among philosophers owing to the separation of ideas from the individuals and their empirical relations which serve as the basis of these ideas. In the same way, here too one can separate right from its real basis, whereby one obtains a "dominant will" which in different eras undergoes various modifications and has its own, independent history in its creations, the laws. On this account, political and civil history becomes ideologically merged in a history of the domination of successive laws. This is the specific illusion of lawyers and politicians, which Jacques le bonhomme adopts *sans façon*. He succumbs to the same illusion as, for example, Frederick William IV, who also regards laws as mere caprices of the dominant will and hence always finds that they come to grief against the "awkward something" [paraphrase from Goethe's Faust, 1. Teil, 1. "Studierzimmerszene", where

Mephistopheles says: "This something, this awkward world"] of the world. Hardly [one] of his quite harmless whims reaches a further stage of realisation than cabinet decrees. Let him issue an order for a twenty-five million loan, i.e., for one hundred and tenth part of the English national debt, and he will see whose will his dominant will is. Incidentally, we shall — find later on, too, that Jacques le bonhomme uses the phantoms or apparitions of his sovereign and fellow-Berliner as documents out of which to weave his own theoretical whimsies about right, law, crime, etc. This should occasion us the less surprise since even the spectre of the *Vossische Zeitung* repeatedly "offers" him something, e.g., the constitutional state. The most superficial examination of legislation, e. g., poor laws in all countries, shows how far the rulers got when they imagined that they could achieve something by means of their "dominant will" alone, i. e., simply by exercising their will. Incidentally, Saint Sancho has to accept the illusion of the lawyers and politicians about the dominant will in order to let his own will be splendidly displayed in the equations and antitheses with which we shall presently delight ourselves, and in order to arrive at the result that he can get out of his head any idea which he has put into it.

"My brethren, count it all joy when ye fall into divers temptations" (Saint-Jacques le bonhomme [James] 1:2)."

Law = Dominant will of the state,

= state will.

Antitheses:

State will, alien will — My will, own will.

Dominant will of the state — My own will

— My self-will.

Subjects of the state, who sustain the law of the state "Subjects of themselves (unique ones), who bear their own law in themselves" (p. 268).

Equations:

A) State will = Not-my will.

B) My will = Not-state will.

C) Will = Desire.

D) My will = Non-desire of the state,

= Will against the state,

= Ill will towards the state.

E) To desire the non-state = Self-will.

Self-will = Not to desire the state.

F) State will = Negation of my will,

= My lack of will.

G) My lack of will = Existence of state will.

(We know already from the preceding that the existence of the state *will* is equal to the existence of the *state,* from which the following new equation results:)

H) My lack of will = Existence of the state.

I) The negation of my lack of will = Non-existence of the state.

K) Self-will = Negation of the state.

L) My will = Non-existence of the state.

Note 1.

According to the already quoted passage from page 256:

"States endure so long as the dominant will is regarded as equivalent to one's own will."

Note 2.

"He who in order to exist" (the conscience. of the state is appealed to) "is compelled to count on the lack of will of others is a creation of those others, just as the master is a creation of the servant" (p. 257). (Equations F, G, H, I.)

Note 3.

"My own will is the corrupter of the state. Therefore, it is branded by the latter as self-will. One's own will and the state are powers that are mortal enemies, between whom eternal peace is impossible" (p. 257). — "Therefore it in fact watches everybody, it sees an egoist in everyone" (self-will), "and it fears the egoist" (p. 263). "The state ... opposes the duel ... even a scuffle is punishable" (even if the police are not called in) (p. 245).

Note 4.

This can also be expressed rhetorically:

"What is the use of your laws if no one obeys them, what is the use of your orders if everybody refuses to accept any orders?" (p. 256).

Note 5.

The simple antithesis: "state will — my will" is given an apparent motivation in the following paragraph: "Even if one were to imagine a case where each individual in the nation had expressed the same will and thus a perfect collective will" (!) "had come into existence, things would still remain the same. Would I not today and later be bound by my will of yesterdays... My creation, that is, a definite expression of will, would have become my master: but I ... the creator, would be hampered in my course and my dissolution.... Because yesterday I possessed will, I have today no will of my own; yesterday voluntary, today involuntary" (p. 258).

The old thesis, which has often been put forward both by revolutionaries and reactionaries, that in a democracy individuals. only exercise their sovereignty for a moment and then at once relinquish their authority — this thesis Saint Sancho endeavours to appropriate here in a "clumsy" fashion by applying to it his phenomenological theory of creator and creation. But the theory of creator and creation deprives this thesis of all meaning. According to this theory of his, it is not that Saint Sancho has no will of his own today because he has changed his will of yesterday, i.e., has a differently defined will, so that the nonsense which yesterday he exalted into a law as the expression of his will, now weighs like a bond or fetter on his more enlightened will of today. On the contrary, according to his theory, his, will of today *must* be the negation of his will of yesterday, because, as creator, he is in duty bound to dissolve his will of yesterday. Only as "one without will" is he creator, as one actually having will he is always the creation. (See "Phenomenology") In that case, however, it by no means follows that "because yesterday he possessed will", today he is "without will", but rather that he bears *ill will* to his will of yesterday, whether the latter has assumed the form of law or not. In both cases he can abolish it as he, in general, is accustomed to do, namely *as his will.* Thereby he has done full justice to egoism in agreement with itself. It is, therefore, a matter of complete indifference here whether his will of yesterday has assumed as law the form of something existing outside his head, particularly if we recall that earlier the "word which escaped from him" behaved likewise in a rebellious way towards him. In the above-mentioned thesis, moreover, Saint Sancho desires to preserve, not indeed his self-will, but his *free* will, *freedom* of will, *freedom*, which is a serious offence against the moral code of the egoist in agreement with himself. In committing this offence, Saint

Sancho even goes so far as to proclaim that true peculiarity is the inner freedom that was so much condemned above, the freedom of bearing ill will.

"How is this to be changed?," cries Sancho. "Only in one way: by not recognising any duty, i.e., not binding myself and not allowing myself to be bound [...]

"However, they will bind me' No one can bind my will, and my ill will remains free!" (p. 258).

Drums and trumpets pay homage

To his youthful splendour!

[From Heine's poem "Berg-Idylle"]

Here Saint Sancho forgets "to make the simple reflection" that his will" is indeed "bound" inasmuch as, against his will, it is "*ill* will".

The above proposition that the individual will is bound by the general will expressed through law completes, by the way, the idealistic conception of the state, according to which it is only a matter of the will, and which has led French and German writers to the most subtle philosophising.

Incidentally, if it is merely a matter of "desiring" and not of "being able" and, at worst, merely of "ill will", then it is incomprehensible why Saint Sancho wants to abolish altogether an object so productive of "desiring" and "ill will" as state law.

"Law in general, etc. — that is the stage we have reached today" (p. 256).

The things Jacques le bonhomme believes!

The equations so far examined were purely destructive as regards state and law. The true egoist *had* to adopt a purely destructive attitude to both. We missed appropriation; on the other hand, we had the satisfaction of seeing Saint Sancho performing a great trick

in which he shows how the state is destroyed by a mere change of will, a change which in turn depends, of course, only on the will. However, appropriation is not lacking here either, although it is quite secondary, and can produce results only later on "from time to time". The two antitheses given above:

State will, alien will — My will, own will, Dominant will of the state — My own will

can also be summarised as follows:

Domination of alien will — Domination of one's own will.

In this new antithesis, which incidentally all the time formed the concealed basis of his destruction of the state through his self-will, Stirner appropriates the political illusion about the domination of arbitrariness, of ideological will. He could also have expressed this as follows:

Arbitrariness of law — Law of arbitrariness.

Saint Sancho, however, did not reach such simplicity of expression.

In antithesis III we already have a "law within him", but he appropriates the law still more directly in the following antithesis:

Law, the state's declaration of will — Law, declaration of my will, my declaration of will.

"Someone can, of course, declare what he is prepared to put up with, and consequently forbid the opposite by a law," etc. (p. 256).

This prohibition is necessarily accompanied by threats. The last antithesis is of importance for the section on crime.

Episodes. We are told on page 256 that there is no difference between "law" and "arbitrary command, ordinance" because both = "declaration of will", consequently "command". — On pages 254, 255, 260 and 263, while pretending to speak about "the State" Stirner substitutes the *Prussian* state and deals with questions that are of the greatest importance for the *Vossische Zeitung*, such as the constitutional state, removability of officials, bureaucratic arrogance and similar nonsense. The only important thing here is the discovery that the old French parliaments insisted on their right to register royal edicts *because* they wanted "to judge according to their own right". The registration of laws by the French parliaments came into being at the same time as the bourgeoisie and hence the acquisition of absolute power by the kings, for whom in face of both the feudal nobility and foreign states it became necessary to plead an alien will on which their own will depended, and at the same time to give the bourgeois some sort of guarantee. Saint Max can learn more about this from the history of his beloved Francis 1; for the rest, before speaking about the French parliaments again, he might consult the fourteen volumes of *Des Etats généraux et autres assemblées nationales,* Paris, 1788 [by Charles Joseph Mayer] concerning what the French parliaments wanted or did not want and their significance. In general it would be in place here to introduce a short episode about the *erudition* of our saint who is so desirous of conquests. Apart from theoretical works, such as the writings of Feuerbach and Bruno Bauer, as well as the Hegelian tradition, which is his main source, apart from these meagre theoretical sources, our Sancho uses and quotes the following historical sources: on the French Revolution — Rutenberg's *Politische Reden* and the Bauers' *Denkwürdigkeiten*; on communism —

Proudhon, August Becker's *Volksphilosophie,* the *Einundzwanzig Bogen* and the Bluntschli report; on liberalism — the *Vossische Zeitung*, the *Sächsische Vaterlands-Blätter*, Protocols of the Baden Chamber, the Einundzwanzig Bogen again and Edgar Bauer's epoch-making work [Edgar Bauer, Die liberalen Bestrebungen in Deutschland]; in addition, here and there as historical evidence there are also quoted: the Bible, Schlosser's *18. Jahrhundert* [Friedrich Christoph Schlosser, Geschichte des achtzehnten Jahrhunderts und des neunzehnten bis zum Sturz des französischen Kaiserreichs], Louis Blanc's *Histoire de dix ans*, Hinrichs' *Politische Vorlesungen*, Bettina's *Dies Buch gehört dem König*, Hess' *Triarchie*, [Moses Hess, Die europäische Triarchie] the *Deutsch-Französische Jahrbücher*, the Zurich *Anekdota*, Moriz Carrière on Cologne Cathedral, the session of the Paris Chamber of Peers of April 25, 1844, Karl Nauwerck, *Emilia Galotti* [reference is to Moriz Carrière, Der Kölner Dom als freie deutsche Kirche; François Guizot, Discours dans la chambre des pairs le 25 april 1844; Karl Nauwerck, Ueber die Theilnahme am Staate; Gotthold Ephraim Lessing's drama Emilia Galotti], the Bible — in short, the entire Berlin reading-room together with its owner, Willibald Alexis Cabanis. After this sample of Sancho's profound studies, one can easily understand why it is that he finds in this world so very much that is alien, i.e., holy.

III. Crime

Note 1.

"If You allow yourself to be judged right by someone else, then you must equally allow yourself to be judged wrong by him. If you receive justification and reward from him, then expect also accusation and punishment from him. Right is accompanied by wrong, Legality by crime. Who — are — you? — You — are — a — criminal!!" (p. 262).

The *code civil* is accompanied by the *code pénal*, the *code pénal* by the *code de commerce*. Who are you? You are a *commerçant*!

Saint Sancho could have spared us this nerve-shattering surprise. In his case the words: "If you allow yourself to be judged right by someone else, then you must equally allow yourself to be judged wrong by him" have lost all meaning if they are intended to add a new definition; for one of his earlier equations already states: If you allow yourself to be judged right by someone else, then you allow yourself to be judged by alien right, hence *your wrong*.

A. Simple Canonisation of Crime and Punishment

---

a) Crime

As regards crime, we have already seen that this is the name for a universal category of the egoist in agreement with himself, the negation of the holy, *sin*. In the previously given antitheses and equations concerning examples of the holy (state, right, law), the negative relation of the ego to these holies, or the copula, could also be called crime, just as about Hegelian logic, which is likewise an example of the holy, Saint Sancho can also say: I am not Hegelian logic, I am a sinner against Hegelian logic. Since he was speaking of right, state. etc., he should now have continued: another example of sin or crime are what are called *juridical* or *political* crimes. Instead of this, he again informs us in detail that these crimes are

sin against the holy,

sin against the fixed idea,

sin against the spectre,

sin against "Man".

"Criminals exist only against something holy" (p. 268).

"Only owing to the holy does the criminal code exist" (p. 318).

"Crimes arise from the fixed idea" (p. 269).

"One sees here that it is again 'man' who also creates the concept of crime, of sin, and thereby also of right." (Previously it was the reverse.) "A man in whom I do not recognise man is a sinner" p, 268).

Note 1.

"Can I assume that someone commits a crime against me" (this is asserted in opposition to the French people in the revolution), "without also assuming that he ought to act as I consider right? And actions of this kind I call the right, the good, etc., those deviating from this — a crime. Accordingly I think that the others ought to aim with me at the same goal ... as beings who should obey some sort of 'rational' law" (Vocation! Designation! Task! The Holy!!!). "I lay down what man is and what it means to act truly as a man, and I demand from each that this law should become for hint the norm and the ideal; in the reverse case he proves himself a sinner and criminal ..." (pp. [267,] 268).

At the same time, he sheds an anxious tear at the grave of those "proper people" who in the epoch of terror were slaughtered by the sovereign people in the name of the holy. Further, by means of an example, he shows how the names of real crimes can I be construed from this holy-point of view.

"If, as in the revolution, this spectre, man, is understood to mean the 'good citizen', then the familiar 'political transgressions and crimes' are brought about from this concept of man." (He should have said: this concept, etc., brings up the familiar crimes) (p. 268).

A brilliant example)f the extent to which credulity is Sancho's predominant quality in the section on crime is furnished by his transformation of the sansculottes of the revolution into "good citizens" of Berlin through a synonymical abuse of the word *citoyen*. According to Saint Max, "good citizens and loyal officials" are inseparable. Hence "Robespierre, for example, Saint-Just, and so on" would be "loyal officials", whereas Danton was responsible for a cash deficit and squandered state money. Saint Sancho has made a good start for a history of the revolution for the Prussian townsman and villager.

Note 2.

Having thus described for us political and juridical crime as an example of crime in general — namely his category of crime, sin, negation, enmity. insult, contempt for the holy, disreputable behaviour towards the holy — Saint Sancho can now confidently declare:

"In crime, the egoist has hitherto asserted himself and mocked the, holy" (p. 319)

In this passage all the crimes hitherto committed are assigned to the credit of the egoist in agreement with himself, although subsequently we shall have to transfer a few of them to the debit side. Sancho imagines that hitherto crimes have been committed only in order to mock at "the holy" and to assert oneself not against things, but against the holy *aspect* of things. Because the theft committed by a poor devil who appropriates someone else's taler can be put in the category of a crime against the law, *for that reason* the poor devil committed the theft just because of a desire to break the law. In exactly the same way as in an earlier passage Jacques le bonhomme imagined that laws are issued only for the sake of the holy, and that thieves are sent to prison only for the sake of the holy.

---

b) Punishment

Since we are at present concerned with juridical and political crimes we discover in this connection that such crimes "in the ordinary sense" usually involve a *punishment*, or, as it is written, "the wages of sin is death". [Romans 6:23] After what we have already learned about crime, it follows, of course, that punishment is the self-defence and resistance of *the holy* to those who desecrate it.

Note 1.

“Punishment has sense only when it is intended as expiation for violating something holy” (p. 316). In punishing, ‚we commit the folly of desiring to satisfy right, a spectre” (the holy). “The holy must” here “defend itself against man”. (Saint Sancho here “commits the folly” of mistaking “Man” for “the unique ones”, the “proper egos”, etc.) (p. 318).

Note 2.

“Only owing to the holy does the criminal code exist and it disintegrates of itself when punishment is abandoned” (p. 318).

What Saint Sancho really wants to say is: Punishment falls into decay of itself if the criminal code is abandoned, i.e., punishment only exists owing to the criminal code. “But is not” a criminal code that only exists owing to punishment “all nonsense, and is not” punishment that exists only owing to the criminal code “also nonsense"? (Sancho contra Hess, *Wigand*, [Max Stirner, “Recensenten Stirners"] p. 186.) Sancho here mistakes the criminal code for a textbook of theological morality.

Note 3.

As an example of how crime arises from the fixed idea, there is the following:

“The sanctity of marriage is a fixed idea. From this sanctify it follows that infidelity is a crime, and — therefore a certain law on marriage” (to the great annoyance of the “G[erman] Chambers” and of the “Emperor of all R[ussians]”, not to speak of the “Emperor of Japan” and the “Emperor of China”, and particularly the “Sultan”) “imposes a shorter or longer term of punishment for that” (p. 269).

Frederick William !V, who thinks he is able to promulgate laws in accordance with the holy, and therefore is always at loggerheads with the whole world, can comfort himself with the thought that in our Sancho he has found at least one man imbued with faith in the state. Let Saint Sancho just compare the Prussian marriage law, which exists only in the head of its author, with the provisions of the *Code civil,* which are operative in practice, and he will be able to discover the difference between holy and worldly marriage laws.[49] In the Prussian phantasmagoria, for reasons of state, the sanctity of marriage is supposed to be enforced both upon husband and wife; in French practice, where the wife is regarded as the private property of her husband, only the wife can be punished for adultery, and then only on the demand of the husband, who exercises his property right.

B. Appropriation of Crime and Punishment Through Antithesis

1=Crime in the sense of man = Violation of man’s law (of the state’s declaration of will, of state power), p. 259 et seq. 1=Crime in my sense = Violation of my law (of my declaration of will, of my power), p. 256 and passim.

These two equations are counterposed as antitheses and derive simply from the opposition of “man” and the “ego”. They merely sum up what has been said already.

The holy punishes the “ego” — I punish the ‘ego”

Crime = hostility to Man’s law (the Holy). — *Hostility* = crime against my law.

The criminal the enemy or opponent of the holy (the Holy as a moral person). — *Enemy* or *opponent* = criminal against the “ego”, the corporeal.

Punishment = self-defence of the holy against the “ego”. — *My self-defence* = My punishment of the “ego”.

Punishment = satisfaction (vengeance) of man in relation to the “ego”. — *Satisfaction (vengeance)* = My punishment of the “ego”,

In the fast antithesis, satisfaction can also be called *self*-satisfaction, since it is the satisfaction of *me*, in opposition to the satisfaction of *man*.

If in the above antithetical equations only the first member is taken into account, then one obtains the following series of simple antitheses where the thesis always contains the holy, universal, alien *name*, while the *anti*-thesis always contains the worldly, personal, appropriated *name*.

Crime — Hostility.

Criminal — Enemy or opponent.

Punishment — My defence.

Punishment — Satisfaction, vengeance, self-satisfaction.

In an instant we shall say a few words about these equations and antitheses which are so simple that even a “born simpleton” (p. 434) can master this “unique” method of thought in five minutes. But first a few more quotations in addition to those given earlier.

Note 1.

“in relation to me you can never be a criminal but only an opponent” (p. 268),and “enemy” in the same sense on p. 256. — Crime as the hostility of man is illustrated on page 268 by the example of the “enemies of the Fatherland”. — “punishment ought” (a moral postulate) “to be replaced by satisfaction, which again cannot aim at satisfying right or justice, but at giving us satisfaction” (p. 318).

Note 2. While Saint Sancho attacks the halo (the windmill) of existing power, he does not even understand this power, let alone come to grips with it; he only advances the moral demand that the relation of the ego to it should be formally changed. (See “Logic”)

“I am forced to put up with the fact” (bombastic assurance) “that he” (viz. My enemy, who has a few million people behind him) “treats me as his enemy; but I shall never permit him to treat me as his creature or to make his reason or unreasonableness my guiding principle” (p. 256, where he allows the aforesaid Sancho a very restricted freedom, namely the choice between allowing himself to be treated as his creature or of suffering the 3,300 lashes imposed by Merlin on his posaderas. This freedom is allowed him by any criminal code which. it is true, does not first ask the aforesaid Sancho in what form it should declare its hostility to him). "But even if you impress your opponent as a force” (being for him an “impressive force”) “You do not on that account become a sanctified authority; unless he is a wretch. He is not obliged to respect you and pay regard to you even if he has to be on his guard against you and your power” (p. 258).

Here Saint Sancho himself appears as a “wretch” when with the greatest seriousness he haggles [pun on the word Schächer which means “wretch” or “robber”, while schachern means “to barter” to haggle"] about the difference between “to impress” and “to be respected”, “to be on one’s guard” and to “have regard for” — a difference of a sixteenth part at most. When Saint Sancho is “on his guard” against someone,

“he gives himself over to reflection, and he has an object which he has in view, which he respects and which inspires him with reverence and fear” (p. 115).

In the above equations, punishment, vengeance, satisfaction, etc., are depicted as coming only from me; inasmuch as Saint Sancho is the object of satisfaction, the antitheses can be turned round: then self-satisfaction is transformed into another-getting-satisfaction-with-regard-to-me or the prejudicing-of-my-satisfaction.

Note 3.

The very same ideologists who could imagine that right, law, state, etc., arose from a general concept, in the final analysis perhaps the concept of man, and that they were put into effect for the sake of this concept — these same ideologists can, of course, also imagine that crimes are committed purely because of a wanton attitude towards some concept, that crimes, in general, are nothing but making mockery of concepts and are only punished in order to do justice to the insulted concepts. Concerning this we have already said what was necessary in connection with right, and still earlier in connection with hierarchy, to which we refer the reader.

In the above-mentioned antitheses, the canonised definitions — crime, punishment, etc. — are confronted with the name of another definition, which Saint Sancho in his favourite fashion *extracts* from these first definitions and *appropriates for himself.* This new definition, which, as we have said, appears here as a mere name, being worldly is supposed to contain the direct *individual* relation and express the *factual* relations. (See "Logic".) The history of right shows that in the earliest, most primitive epochs these individual, factual relations in their crudest form directly constituted right. With the development of civil society, hence with the development of private interests into class interests, the relations of right underwent changes and acquired a civilised form. They were no longer regarded as individual, but as universal relations. At the same time, division of labour placed the protection of the conflicting interests of separate individuals into the hands of a few persons, whereby the barbaric enforcement of right also disappeared. Saint Sancho's entire criticism of right in the above-mentioned antitheses is limited to declaring the *civilised* form of. legal relations and the civilised division of labour to be the fruit of the "fixed idea", of the holy, and, on the other hand, to claiming *for himself* the barbaric expression of relations of right and the barbaric method of settling conflicts. For him it is all *only* a matter of *names*; he does not touch on the content itself, since he does not know the real relations on which these different forms of right are based, and in the juridical expression of class relations perceives only the idealised names of those barbaric relations. Thus, in Stirner's declaration of will, we rediscover the feud; in hostility, self-defence, etc. — a copy of club-law and practice of the old feudal mode of life; in satisfaction, vengeance, etc. — the *jus talionis,* the old German *Gewere, compensatio, satisfactio* — in short, the chief elements of the *leges barbarorum* and *consuetudines feudorum* [50], which Sancho has appropriated for himself and taken to his heart not from libraries, but from the tales of his former master about Amadis of Gaul. In the final analysis, therefore, Saint Sancho again arrives merely at an impotent moral injunction that everybody should himself obtain satisfaction and carry out punishment. He believes Don Quixote's assurance that by a mere moral injunction he can without more ado convert the material forces arising from the division of labour into personal forces. How closely juridical relations are linked with the development of these material forces due to the division of labour is already clear from the historical development of the power of the law courts and the complaints of the feudal lords about the legal development. (See, e.g., Monteil. loc.

cit., XIV, XV *siècle*) It was just in the epoch between the rule of the aristocracy and the rule of the bourgeoisie, when the interests of two classes came into conflict, when trade between the European nations began to be important, and hence international relations themselves assumed a *bourgeois* character, it was just at that time that the power of the courts of law began to be important, and under the rule of the bourgeoisie, when this broadly developed division of labour becomes absolutely essential, the power of these courts reaches its highest point. What the servants of the division of labour, the judges and still more the *professores juris,* imagine in this connection is a matter of the greatest indifference.

C. Crime in the Ordinary and Extraordinary Sense

We saw above that crime in the ordinary sense, by being falsified, was put to the credit of the egoist in the extraordinary sense. Now this falsification becomes obvious. The extraordinary egoist now finds that he commits only extraordinary crimes, which have to be set against the ordinary crimes. Therefore we debit the aforesaid egoist with the ordinary crimes, which have been previously entered into the credit column.

The struggle of the ordinary criminals against other people's property can also be expressed as follows (although this holds good of any competitor):

that they — "seek *other people's* goods" (p. 265),

seek holy goods,

seek *the holy,* and in this way the ordinary criminal

is transformed into a "believer" (p. 265).

But this reproach which the egoist in the extraordinary sense levels against the criminal in the ordinary sense is only an apparent one — for it is indeed he himself who strives for the halo of the whole world. The real reproach that he levels against the criminal is not that he seeks "*the holy*", but that he seeks "*goods*".

After Saint Sancho has built himself a "world of his own, a heaven", namely this time an imaginary world of feuds and knights-errant, transferred to the modern world, after he has at the same time given documentary evidence of his difference, as a knightly criminal, from ordinary criminals, after this he once more undertakes a crusade against "dragons and ostriches, hobgoblins", "ghosts, apparitions and fixed ideas". His faithful servant, Szeliga, gallops reverently after him. As they wend their way, however, there occurs the astounding adventure of the unfortunate ones who were being dragged off to some place they had no wish to go to, as described in Chapter XXII of Cervantes. For while our knight-errant and his servant Don

Quixote were jogging along their path, Sancho raised his eyes and saw coming towards him some dozen men on foot manacled and bound together by a long chain, accompanied by a commissar and four gendarmes, belonging to the holy Hermandad,[51] to the Hermandad which is holy, to the holy. When they came close, Saint Sancho very politely asked the guards to be so kind as to tell him why these people were being led in chains. — They are convicts of His Majesty sent to work at Spandau,[52] you do not have to know any more. — How, cried Saint Sancho, men being forced? Is it possible that the king can use force against someone's "proper ego"? In that case I take upon myself the vocation of putting a stop to this force. "The behaviour of the state is violent action, and it calls this justice. Violent action of an individual, however, it calls crime." Thereupon Saint Sancho first of all began to admonish the prisoners, saying that they ought not to grieve, that although they were "not free", they were still their "own", and that although maybe their "bones" might "crack" under the lash of the whip and that perhaps they might even have a "leg torn off", yet, he said, you will triumph over all that, for "no one can bind your will"! "And I know for certain that there is no witchcraft in the world that could direct and compel the will, as some simpletons imagine; for the will is our free arbitrary power and there is no magic herb or spell that can subdue it." Yes, "your will no one can bind and your ill will remains free!"

But since this sermon did not pacify the convicts, who began one after the other to relate how they had been unjustly condemned, Sancho said: "Dear brethren, from what you have related it has become clear to me that, although you have been punished for your crimes, yet the punishment which you are suffering gives you little pleasure and that hence you are reluctant to receive it and do not look forward to it. And it is highly possible that the cause of your ruin is pusillanimity on the rack in one case, poverty in another, lack of favour in a third and, finally, the *judge's* unfair *judgment*, and that you *have not been given the justice that was your due*, 'your right'. All this compels me to show you why heaven sent me into the world. But since the wisdom of the egoist in agreement with himself prescribes not doing by force what can be done by agreement, I hereby request the commissar and gendarmes to release you and let you go your ways. Moreover, my dear gendarmes, these unfortunates have done *you* no harm. It does not behove egoists in agreement with themselves to become the executioners of other unique ones who have done them no harm. Evidently, with you 'the category of the one who has been robbed stands in the forefront'. Why do you show such 'zeal' in your actions 'against crime'? 'Verily, verily I say unto you, you are enthusiastic for morality, you are filled with the idea of morality', 'You persecute all those who are hostile to it' — 'Owing to your oath as officials', you are bringing these poor convicts 'to prison', you are the holy! Therefore release these people voluntarily. if you do not, you will have to reckon with me, who overthrows nations with one puff of the living ego', who 'commits the most unmeasured desecration' and 'is not afraid even of the Moon'."

"This is a fine piece of impudence indeed!„ cried the commissar. ‚You'd do better to put that basin straight on your head and be on your way!"

Saint Sancho, however, infuriated by this Prussian rudeness, couched his lance and rushed at the commissar with as much speed as the "apposition" is capable of, so that he immediately threw him to the ground. There ensued a general mêlée, during which the convicts freed themselves from their chains, a gendarme threw Szeliga-Don Quixote into the *Landwehrgraben* [53] or sheep's ditch [*Schafgraben*], and Saint Sancho performed the most heroic feats in his struggle against the holy. A few minutes later, the gendarmes were scattered, Szeliga crept out of the ditch and the holy was abolished for the time being.

Then Saint Sancho gathered round him the liberated convicts and addressed them as follows (pp. 265, 266 of "the book"):

"What is the ordinary criminal" (the criminal in the ordinary sense) "but a man who has committed the fatal mistake" (a fatal story-teller for the citizen and the countryman!) "of striving after what belongs to the people instead of seeking what is his own? He has desired the contemptible" (a general muttering among the convicts at this moral judgment) "goods of another, he has done what believers do who aspire to what belongs to God" (the criminal as a noble soul). "What does the priest do who admonishes the criminal? He tells him of the great violation of right he has committed by his action in desecrating what the state has sanctified, the property of the state, which also includes the life of the state's subjects. Instead of this the priest might have done better to reproach the criminal with having besmirched himself" (titters among the convicts at this egoistical appropriation of banal clerical phraseology) "by not despising the alien but regarding it as worthy of being robbed" (murmuring among the convicts). "He could have done so, were he not a priest" (one of the convicts: "In the ordinary sense!"). I, however, "speak with the criminal as with an egoist, and he will be ashamed" (shameless, loud cheers from the criminals, who do not wish to he called upon to feel shame), "not because he has committed a crime against your laws and your goods, but because he considered it worth while to circumvent your laws" (this refers only to "circumvention in the ordinary sense"; elsewhere, however, "I go round a rock so long as I am unable to blow it up" and I "circumvent", for example, even the "censorship"), "and to desire your goods" (renewed cheers); "he will be ashamed ...

Gines de Passamonte, the arch-thief, who in general was not very patient, shouted: "Are we then to do nothing but feel *ashamed*, be submissive, when a priest in the ***extraordinary sense 'admonishes' us?"***

"He will be ashamed," continues Sancho, ",that he did not despise you, together with what is yours, that he was too little of an egoist." (Sancho here applies an alien measure to the egoism of the criminal. In consequence, a general bellowing breaks out among the convicts; in some confusion, Sancho gives way, turning with a rhetorical gesture to the absent "good burghers".) "But you cannot speak to him egoistically, for you have not the stature of a criminal, you ... perpetrate nothing."

Gines again interrupts: "What credulity, my good man! Our prison warders perpetrate all kinds of crimes, they embezzle, they defraud, they commit rape [... twelve pages of manuscript missing here ...]

[B. My Intercourse]

[I. Society][54]

[...] again he reveals only his credulity. The reactionaries knew already that by the constitution the bourgeoisie abolishes the naturally arisen state and establishes and *makes* its own state, that "*le pouvoir constituant, qui était dans le temps*" naturally "*passa dans la volonté humaine*", ["The constitutional power which had been shaped in the course of time had permeated the human will." Lourdoueix, "Appel à la France contre la division des opinions", quoted from Karl Wilhelm Lancizolle's book Ueber Ursachen, Character und Folgen der Julitage] that "this *fabricated* state was like a fabricated, painted tree", etc. See Fiévée's *Correspondance politique et administrative*, Paris, 1815, *Appel à la France contre la division des opinions, Le drapeau blanc* by Sarran *ainé* the *Gazette de France* of the Restoration period, and the earlier works of Bonald, de Maistre, etc. The liberal bourgeois, in turn, reproach the old republicans — about whom they obviously know as little as Saint Max knows about the bourgeois state — on the grounds that their patriotism is nothing but "une passion *factice* envers un être abstrait, une *idée* générale" ["An artificial passion directed towards something abstract, a general idea."] (Benj. Constant, *De 1'esprit de conquête*, Paris, 1814, p. 48), whereas the reactionaries accused the bourgeois on the grounds that their political ideology is nothing but "*une mystification que la classe aisée fait subir à celles qui ne le sont pas*" (*Gazette de* France, 1831, Février. ["A deception with which the wealthy class deludes those that are not wealthy." Quoted from Karl Wilhelm Lancizolle, op. cit.]

On page 295, Saint Sancho declares that the state is "an institution for making the nation Christian", and all he can say about the basis of the state is that it "is held together" with the "cement" o "respect for the law", or that the holy "is held together" by respect (the holy as link) for the holy (p. 314).

Note 4.

If the state is holy, there must be censorship" (p. 316). "The French Government does not contest freedom of the press as a right of man, but it demands a guarantee from the individual that he is really a human being." (Quel bonhomme! [What a simpleton] Jacques le bonhomme is "called upon" to study the September Laws[55]) (p. 380).

Note 5, in which we find the most profound explanations about the various forms of the state, which Jacques le bonhomme makes independent and in which he sees only different attempts to realise the true state.

"The republic is nothing but absolute monarchy, for it makes no difference whether the monarch is called prince of people, since both are majesties" (the holy) ... "Constitutionalism is a step further than the republic, for it is the state in the process of dissolution."

This dissolution is explained as follows:

"In the constitutional state ... the government wants to be absolute, and the people wants to be absolute. These two absolutes" (i.e., holies) "will destroy one another" (p. 302). "I am not the state, I am the creative negation of the state"; "thereby all questions" (about the constitution, etc.) "sink into their true nothing" (p. 310).

He should have added that these propositions about forms of the state are merely a paraphrase of this "nothing", whose sole creation is the proposition given above: I am not the state. Saint Sancho, just like a German school-master, speaks here of "the republic," which is, of course, far older than constitutional monarchy, e.g., the Greek republics.

That in a democratic, representative state like North America class conflicts have already reached a form which the constitutional monarchies are only just being forced to approach — about this, of course, he knows nothing. His phrases about constitutional monarchy prove that since 1842 by the Berlin calendar[56], he has learned nothing and forgotten nothing. [paraphrase of the French saying: "Ils n'ont rien appris ni rien oublié" — "They have learned nothing and forgotten nothing"; when it was first coined, shortly after the French Revolution, it was used in relation to the royalists]

Note 6.

"The state owes its existence only to the contempt which I have for myself", and with the disappearance of this disdain it will fade away entirely" (it seems that it depends solely on Sancho how soon all the states on earth will "fade away". Repetition of Note 3 in the reversed equation, see "Logic"): "It exists only when it is superior to me, only as might [Macht] and the mighty [Mächtiger]. Or" (a remarkable or which proves just the opposite of what it is intended to prove)

“can you imagine a state the inhabitants of which in all their entirety” (a jump from “I” to “we”) “attach no importance to it [sich allesamt nichts aus ihm machen]?” (p. 377).

There is no need to dwell on the synonymy of the words “ *Macht* “*Mächtig”* and “*machen*”.

From the fact that in any state there are people who attach importance to it, i.e., who, in the state and thanks to the state, *themselves* acquire importance, Sancho concludes that the state is a power standing above these people. Here again it is only a matter of getting the fixed idea about the state out of one’s mind. Jacques le bonhomme continues to imagine that the state is a mere idea and he believes in the independent power of this idea of the state. He is the true “politician who believes in the state, is possessed by the state” (p. 309). Hegel idealises the conception of the state held by the political ideologists who still took separate individuals as their point of departure, even if it was merely the will of these individuals; Hegel transforms the common *will* of these individuals into the absolute will, and Jacques le bonhomme *bona fide* accepts this idealisation of ideology as the correct view of the state and, in this belief, criticises it by declaring the Absolute to be the Absolute.

---

5. Society as Bourgeois Society

We shall spend somewhat more time on this chapter because, not unintentionally, it is the most confused of all the confused chapters in “the book”, and because at the same time it proves most strikingly how little our saint succeeds in getting to know things in their mundane shape. Instead of making them worldly, he makes them holy by “giving” the reader the “benefit” only of his own holy conception. Before coming to bourgeois society proper, we shall hear some new explanations about property in general and in its relation to the state. These explanations appear the newer because they give Saint Sancho the opportunity to put forward again his most favourite equations about right and the state and thus to give his “treatise” “more manifold transformations” and “refractions”. We need, of course, only quote the last members of these equations since the reader will still have it mind their context from the chapter “My Power”.

Private property or bourgeois property = Not my property

= Holy property

= Property of others

= Respected property or respect for the property of others

= Property of *man* (pp. 327, 369).

From these equations one obtains at once the following antitheses:

Property in the bourgeois sense = Property in the egoistical sense (p. 327).

“Property of *man*” = “My property.”

(“Human belongings” = My, belongings.) p. 324.

Equations: Man = Right

= State power.

Private property or bourgeois property = Rightful property (p. 324),

= mine by virtue of right (p. 332),

= guaranteed property,

= property of others,

= property belonging to another,

= property belonging to right,

= property by right (pp. 367, 332),

= a concept of right,

= something spiritual,

= universal,

= fiction,

= pure thought,

= fixed idea,

= spectre,

= property of the spectre (pp. 368, 324, 332, 367, 369).

Private property = Property of right.

Right = Power of the state.

Private property = Property in the power of the state

= State property or also

Property = State Property.

State property = My non-property.

State = The sole owner (pp. 339, 334).

We now come to the antitheses:

Private property — *Egoistical property.*

Authorised by right (by the state, by Man) to have property — Empowered by me to have property (p. 339).

Mine by virtue of right — Mine by virtue of my power or force (p. 332).

Property given by another — Property taken by, me (p. 339).

Rightful property of others — Rightful property of another is what I consider right(p. 339),

which can be repeated in a hundred other formulas if, for example, one puts plenary powers instead of power, or uses formulas already given.

Private property = alien relation to the property of all others — My property, = property relation to the property of all others.

Or also:

Property comprising a few objects — Property comprising everything (p. 343).

Alienation [*Entfremdung*], as the relation or link in the above equations, can be expressed also in the following antitheses:

Private property	— *Egoistical property.*
"To behave towards property as towards something holy,	— "To renounce the holy relation towards property",
a spectre",	no longer to regard it as alien,
"to respect it",	no longer to fear the spectre,
"to have respect for property" (p. 324).	to have no respect for property,
	to have the property of lack of respect (pp. 368, 340, 343).

The modes of appropriation contained in the above equations and antitheses will be dealt with when we come to the " union ", but as for the time being we are still in the "holy society", we are here only concerned with canonisation.

Note. In the section "Hierarchy" we already dealt with the question why the ideologists can regard the property relation as a relation of "Man", the different forms of which in different epochs are determined by the individuals' conception of "Man". It suffices here to refer the reader to that analysis.

Treatise 1. On the parcellation of landed property, the redemption of feudal obligations and the swallowing-up of small landed property by large landed property.

All these things are deduced from holy property and the equation: bourgeois property = respect for the holy.

1) "Property in the bourgeois sense means holy property, in such a way that I must respect your property. 'Respect for property!' Hence the politicians would like everyone to possess his little piece of property and by their endeavour have partly brought about an incredible parcellation" (pp. 327, 328). — 2) "The political liberals see to it that as far as possible all feudal obligations are redeemed and that everyone is a free master on his land, even though this land has only such a quantity of ground" (the land has a quantity of ground!) "that it can be adequately fertilised by the manure from one person.... No matter how small it is, so long as it is one's own, i.e., a respected property! The more such owners there are, the more free people and good patriots has the state" (p. 328). — 3) "Political liberalism, like everything religious, counts

on respect, humanity, the virtues of love. Therefore it experiences constant vexation. For in practice people respect nothing, and every day small properties are being bought up by large landowners, and the 'free people' are turned into day-labourers. If, on the other hand, the 'small owners' had borne in mind that large property also belongs to them, they would not have respectfully excluded themselves from it and would not have become excluded" (p. 328).

1) Here, therefore, first of all the whole development of parcellation, about which Saint Sancho knows only that it is the holy, is explained from a mere idea which "the politicians" "have got into their heads". *Because* "the politicians" demand "respect for property", *hence* they "would like" parcellation, which moreover was carried out everywhere by *not respecting* other people's property! "The politicians" actually have "partly brought about an incredible parcellation". It was therefore through the action of the "politicians" that in France even before the revolution, just as today in Ireland and partly in Wales, parcellation had long existed in *agriculture*, and that capital and all other conditions were lacking for large-scale cultivation. Incidentally, how much "politicians" nowadays "world like" to carry out parcellation, Saint Sancho could see from the fact that all the French bourgeois are dissatisfied with parcellation, both because it weakens competition among the workers and also for political reasons; further, from the fact that all reactionaries (as Sancho could see if only from the *Erinnerungen* of the old Arndt) regarded parcellation simply as the conversion of landed property into modern, industrial, marketable, desanctified property. We shall not here set forth for our saint the *economic* reasons why the bourgeoisie, as soon as it has attained power, must carry out this conversion, which can come about both by the abolition of land rents that exceed profit and by parcellation. Nor shall we explain to him that the form in which this conversion takes place depends on the level of development of industry, trade, shipping, etc., in the country concerned. The propositions cited above about parcellation are nothing more than a bombastic circumlocution of the simple fact that in various places "here and there" considerable parcellation exists — expressed in our Sancho's canonising manner of speech, which suits everything and nothing. For the rest, Sancho's propositions given above contain merely the fantasies of the German petty bourgeois about parcellation which, of course, is for him the alien, "the holy". Cf. "Political Liberalism".

2) The redemption of feudal obligations, a misery which occurs only in Germany, where the governments were only compelled to carry it through by the more advanced conditions in neighbouring countries and by financial difficulties — this redemption is held by our saint to be something that "the political liberals" desire in order to produce "free people and good burghers". Sancho's horizon again does not go beyond the Pomeranian Landtag and the Saxon Chamber of Deputies. This German redemption of feudal obligations never led to any political or economic

results and, being a half-measure, remained without any effect at all. Sancho knows nothing, of course, about the *historically* important redemption of feudal obligations in the fourteenth and fifteenth centuries which was due to the commencing development of trade and industry and the landowners' need for money.

The very same people who, like Stein and Vincke, wanted the redemption of feudal obligations in Germany in order, as Sancho believes, to make good burghers and free people, found later on that in order to produce "good burghers and free people" feudal obligations ought to be restored, as is just now being attempted in Westphalia. From which it follows that "respect", like the fear of God, is useful for all purposes.

3) The "buying-up" of small landed property by the "large landowners" takes place, according to Sancho, because in practice "respect for property" does not occur. Two of the most common consequences of competition — concentration and buying-up — and competition as a whole, which does not exist without concentration, seem here to our Sancho to be *violations* of bourgeois *property*, which moves within the sphere of competition. Bourgeois property is already violated by the very fact of its existence. In Sancho's opinion, it is not possible to buy anything without attacking property. How deeply Saint Sancho has penetrated into the concentration of landed property can already be deduced from the fact that he sees in it only the most obvious act of concentration, the mere "buying-up". Incidentally, from what Sancho says it is not possible to perceive to what extent small landowners cease to be owners by becoming day-labourers. Indeed, on the following page (p. 329) Sancho himself with great solemnity advances as an argument against Proudhon that they continue to be "owners of the share remaining to them in the utilisation of the land", namely owners of wages. "It can sometimes be observed in history" that large landed property swallows up small landed property, and then in turn the small swallows up the large, two phenomena which, in Saint Sancho's opinion, become peacefully resolved into the adequate reason that "in practice people respect nothing". The same thing holds good for the other manifold forms of landed property. And then the wise "if the small owners had", etc.! In the Old Testament we saw how Saint Sancho, in accordance with the speculative method, made earlier generations reflect on the experiences of later ones; now we see how, in accordance with his ranting method, he complains that the earlier generations have failed to bear in mind not only the thoughts of later generations about them, but also his own nonsense. What schoolmasterly "wisdom! If the terrorists had considered that they would bring Napoleon to the throne, if the English barons at the time of Runnymede and Magna Charta had considered that in 1849 the Corn Laws [57] would be repealed, if Croesus had considered that Rothschild would surpass him in riches, if Alexander the Great had considered that Rotteck would judge him and that his Empire would fall into the hands of the Turks, if Themistocles had considered that he would defeat the Persians in the interests of Otto the Child,[58] if Hegel had considered that he would

be exploited in such a "vulgar" way by Saint Sancho, if, if, if! About what kind of "small owners" does Saint Sancho fancy that he is talking? About the propertyless peasants who only *became* "small owners" as a result of the parcelling out of large landed property, or about those who are being ruined nowadays as a result of concentration? For Saint Sancho these two cases are as like as two drops of water. In the first case, the small owners did not by any means exclude themselves from "large property", but each took possession of it insofar as he was not excluded by others and had the power to do so. This power, however, was not Stirner's vaunted power, but was determined by quite empirical relations, e.g., their development and the whole preceding development of bourgeois society, the locality and its greater or lesser degree of connection with the neighbourhood, the size of the piece of land taken into possession, and the number of those who appropriated it, the relations of industry, of intercourse, means of communication, instruments of production, etc., etc' That they had no intention of excluding themselves from large landed property is evident even from the fact that many of them became large landed proprietors themselves. Sancho makes himself ridiculous even in Germany by his unreasonable demand that these peasants should have jumped the stage of parcellation, which did not yet exist and was at that time the only revolutionary form for them, and that they should have thrown themselves at a bound into his egoism in agreement with itself. Disregarding this nonsense of his, it was not possible for these peasants to organise themselves communistically, since they lacked all the means necessary for bringing about the first condition of communist association, namely collective husbandry, and since, on the contrary, parcellation was only one of the conditions which subsequently evoked the need for such an association. In general, a communist movement can never originate from the countryside, but only from the towns.

In the second case, when Saint Sancho talks of the ruined small owners, these still have a common interest with the big landowners as against the wholly propertyless class and the industrial bourgeoisie. If this common interest is absent, they lack the power to appropriate large landed property, since they live scattered and their whole activity and way of life make association, the first condition for such appropriation, impossible for them, and such a movement, in its turn, presupposes a much more general movement which by no means depends on them.

Finally, Sancho's whole tirade amounts to this: that they ought merely to get rid of their respect for the property of others. We shall hear a little more about this later on.

In conclusion, let us take one more proposition *ad acta*. "*The point is that in practice people respect nothing*," so, after all, it appears that it is not "just" a matter of "respect".

Treatise No. 2. Private property, state and right.

"If, if, if!"

"If" Saint Sancho had for one moment set aside the current ideas of lawyers and politicians about private property, and also the polemic against it, if he had once looked at this private property in its empirical existence, in its connection with the productive forces of individuals, then all his Solomon's wisdom, with which he will now entertain us, would have been reduced to nothing. Then it would hardly have escaped him (although like Habakkuk he is *capable de tout* [59]) that private property is a form of intercourse necessary for certain stages of development of the productive forces; a form of . intercourse that cannot be abolished, and cannot be dispensed with in the production of actual material life, until productive forces have been created for which private property becomes a restricting fetter. In that case it could not have escaped the reader also that Sancho ought to have occupied himself with material relations, instead of dissolving the whole world in a system of theological morality in order to set against it a new system of would-be egoistical morality. It could not have escaped him that it was a question of things altogether different from "respect" or disrespect. "If, if, if!"

Incidentally, this "if" is only an echo of Sancho's proposition given above; for "if" Sancho had done all that, he obviously could not have written his book.

Since Saint Sancho accepts in good faith the illusion of politicians, lawyers and other ideologists which puts all empirical relations upside-down, and, in addition, in the German manner adds something of his own, *private property* for him *becomes transformed* into *state property*, or *property by right*, on which he can now make an experiment to justify his equations given above. Let us first of all look at the transformation of private property into state property.

"The question of property is decided only by force" (on the contrary, the question of force has so far been decided by property), "and since the state alone is the mighty one — irrespective of whether it is a state of burghers, a state of ragamuffins" (Stirner's "union") "or simply a state of human beings — it alone is the owner" (p. 333).

Side by side with the fact of the German "state of burghers" here again fantasies invented by Sancho and Bauer appear on an equal footing, whereas no mention is made anywhere of the historically important state formations. First of all he transforms the state into a person, into "the Mighty one". The fact that the ruling class establishes its joint domination as public power, as the state, Sancho interprets and distorts in the German petty bourgeois manner as meaning that the "state" is established as a third force against this ruling class and absorbs all power in the face of it. He proceeds now to confirm this belief of his by means of a series of examples. Because property under the rule of the bourgeoisie, as in all epochs, is bound up with definite conditions, first of all economic, which depend on the degree of development of the productive forces and intercourse — conditions which inevitably acquire a legal and political expression — Saint Sancho in his simplicity believes that

"the state links possession of property" (car tel est son bon plaisir [because it chooses to do so — a paraphrase of the concluding words of French royal edicts]) "just as it links everything else, e.g., marriage, with certain conditions" (p. 335).

Because the bourgeois do not allow the state to interfere in their private interests and give it only as much power as is necessary for their own safety and the maintenance of competition and because the bourgeois in general act as citizens only to the extent that their private interests demand it, Jacques le bonhomme believes that they are "nothing" in face of the state.

"The state is only interested in being wealthy itself; whether Michael is rich and Peter poor is a matter of indifference to it ... in face of it both of them are nothing" (p. 334).

On page 345 he derives the same wisdom from the fact that competition is tolerated in the state.

Because the board of a railway is concerned about its shareholders only insofar as they make their payments and receive their dividends, the Berlin school-master in his innocence concludes that the shareholders are "nothing in face of the board just as we are all sinners in the face of God". On the basis of the impotence of the state in face of the activities of private property-owners Sancho proves the impotence of private property-owners in face of the state and his own impotence in face of both.

Further, since the bourgeois have organised the defence of their own property in the state, and the "ego" cannot, therefore, take away his factory "from such and such a manufacturer", except under the conditions of the bourgeoisie, i.e., under the conditions of competition, Jacques le bonhomme believes that

"the state has the factory as property, the manufacturer holds it only in fee, as possession" (p. 347).

In exactly the same way when a dog guards my house it "has" the house "as property", and I hold it only "in fee, as possession" from the dog. Since the concealed material conditions of private property are often bound to come into contradiction with the *juridical illusion* about private property — as seen, for example, in expropriations — Jacques le bonhomme, concludes that

"here the otherwise concealed principle that only the state is the property-owner whereas the individual is a feudal tenant, strikes the eye" (p. 335).

All that "strikes the eye here" is the fact that worldly property relations are hidden from the eyes of our worthy burgher behind the mantle of "the holy", and that he has still to borrow a "heavenly ladder" from China In order to "climb" to the "rung of civilisation" attained even by school-masters in civilised countries. In the same way as Sancho here transforms the contradictions belonging to the *existence* of private property into the *negation* of private property, he dealt, as we saw above, with the contradictions within the bourgeois family. Since the bourgeois, and in general all the members of civil society, are forced to constitute themselves as "we", as a juridical person, as the state, in order to safeguard their common interests and — if only because of the division of labour — to delegate the collective power thus created to a few persons, Jacques le bonhomme imagines that

"each has the use of property only so long as he bears within himself the ego of the state or is a loyal member of society.... He who is a state — ego, i.e., a good burgher or subject, he, as such an ego, not as his own, holds the fee undisturbed" (pp. 334, 335).

From this point of view, a. person possesses a railway share only so long as he "bears within himself" the "ego" of the board; consequently it is only as a saint that one can possess a railway share. Having in this way convinced himself of the identity of private and state property, Saint Sancho can continue:

"That the state does not arbitrarily take away from the individual that which he has from the state, only means that the state does not rob itself" (pp. 334, 335).

That Saint Sancho does not arbitrarily rob others of their property only means that Saint Sancho does not rob himself, for indeed he "*regards*" all property as his own.

One cannot demand of us that we should deal further with the rest of Saint Sancho's fantasies about the state and property, e.g., that the state "tames" and "rewards" individuals by means of property, that out of special malice it has invented high stamp duties in order to ruin the citizens if they are not loyal, etc., etc. and in general with the *petty-bourgeois German* idea of the *omnipotence* of the state, an idea which was already current among the old German lawyers and is here presented in the form of grandiloquent assertions.

Finally Saint Sancho also tries to confirm his adequately proved identity of state and private property by means of etymological synonymy; in doing which, however, he belabours his erudition *en ambas posaderas*.

"My private property is only that which the state allows me out of its property, by depriving [privieren] other state members of it: it is state property" (p. 339).

By chance this is just the reverse of what happened. Private property in *Rome*, to which alone this etymological witticism can relate, was in the most direct contradiction to state property. True, the state gave the plebeians private property; in doing so it did not, however, deprive "others" of their private property but deprived these plebeians themselves of their state property (*ager publicus* [common land]) and their political rights, and it was precisely on that account that they *themselves* were called *privati*, robbed ones. and not the fantastical "other state members" of whom Saint Sancho dreams. Jacques le bonhomme covers himself with shame in all countries, all languages and all epochs as soon as he begins to talk about positive facts concerning which "the holy" cannot have any knowledge *a priori*. Desperation because the state swallows up all property drives Sancho back to his innermost "indignant" self-consciousness, where he is surprised to discover that he is a *man of letters*. He expresses his astonishment in the following remarkable words:

"In opposition to the state I feel ever more clearly that I still retain one great power, power over myself."

Further on this is developed thus:

"My thoughts constitute real property for me with which I can carry on trade" (p. 339).

Thus, Stirner the "ragamuffin", the "man of only ideal wealth", arrives at the desperate decision to carry on trade with the curdled, sour milk of his thoughts. [60] But what cunning does he use if the state declares his thoughts to be contraband? Just listen to this:

"I renounce them" (which is undoubtedly very wise) "and exchange them for others" (that is, if anyone should be such a bad businessman as to accept his exchanges of thoughts), " which then become my new, purchased property" (p. 339).

Our honourable burgher will not rest until he has it in black and white that he has bought his property honestly. Here one sees the consolation of the Berlin burgher in the face of all his political calamities and police tribulations: "Thoughts are free of customs duty!" [Martin Luther, Von weltlicher Obrigkeit]

The transformation of private property into state property reduces itself, in the final analysis, to the idea that the bourgeois has possessions only as a member of the bourgeois species, a species which as a whole is called the state and which invests individuals with the fief of property. He re again the matter is put upside-down. In the bourgeois class, as in every other, it is only personal conditions that are developed into common and universal conditions under which the separate members of the class possess and live. Although previously philosophical illusions of this kind could be current in Germany, they have now become completely ludicrous, since world trade has adequately proved that bourgeois gain is quite independent of politics, but that politics, on the other hand, is entirely dependent on bourgeois gain. Already in the eighteenth century, politics was so dependent on trade that when, for example, the French Government wanted to raise a loan, the Dutch demanded that a private individual should stand security for the state.

That "my worthlessness" or "pauperism" is the "realisation of the value" or the "existence" of the "state" (p. 336) is one of the thousand and one Stirnerian equations which we mention here only because in this connection we shall hear something new about pauperism.

"Pauperism is my worthlessness, the phenomenon that I cannot realise my value. Hence state and pauperism are one and the same.... The state is always trying to derive benefit from me, i.e., to exploit me. make use of me, to utilise me, even though this utilisation consists merely in my providing proles [offspring] (proletariat). It wants me to be its creature" (p. 336).

Apart from the fact that one sees here how little it depends on him to realise his value, although everywhere and at all times he can assert his peculiarity, and that here once again, in contradiction to former statements, essence and appearance are totally divorced from each other, we have again the above-mentioned petty-bourgeois view of our *bonhomme* that the "state" wants to exploit him. The only further point of interest to us is the ancient Roman etymological derivation of the word "proletariat", which is here naively smuggled into the modern state. Does Saint Sancho really not know that wherever the modern state has developed, "providing *proles*" is for the state, i.e., the official bourgeois, precisely the most unpleasant activity of the proletariat? Perhaps he ought to translate Malthus and Minister Duchâtel into German, [Thomas Robert Malthus, An Essay on the Principle of Population; Charles Marie Duchâtel, De la Charité] for his own benefit', just now, Saint Sancho, as a German petty bourgeois, "felt" "ever more clearly" that "in opposition to the state he still retained one great power", namely — the power to think in defiance of the state. If he were an English proletarian He would have felt that he "retained the power" to produce children in defiance of the state. Another Jeremiad against the state! Another theory of pauperism! To start with he, as "ego", "creates" "flour, linen or iron and coal", thereby from the outset abolishing division of labour. Then he begins "to complain" "at length" that his work is not paid for at its value, and in the first instance he comes into conflict with those who pay for it. Then the state comes between them in the role of "conciliator".

"If I am not satisfied with the price it" (i.e., the state) "pays for my commodity and labour, if instead I myself endeavour to fix the price of my commodity, i.e., try to see that it is lucrative for me, I come into conflict in the first instance" (a great "in the first instance"! — not with the state, but) "with the buyers of the commodity" (p. 337).

If then he wants to enter into "direct relation" with these buyers, i.e., "seize them by the throat", the state "intervenes", "tears man from man" (although it was not a matter of "man in general" but of worker and employer or, what he lumps together in confusion, of the seller and buyer of commodities); moreover, the state does this with the malicious intention "to put itself in the middle as *spirit*" (obviously the holy spirit).

"Workers who demand higher wages are treated as criminals as soon as they try to achieve this by force" (p. 337).

Once more we are presented with a bouquet of nonsense. Mr. Senior need never have written his letters on wages [Nassau William Senior, Three Lectures on the Rate of Wages] if he had first entered into "direct relation" with Stirner, especially as in that case the state would hardly have "torn man from man". Sancho here gives the state a triple function. It first acts as a "conciliator", then as price fixer, and finally as "spirit", as the holy. The fact that, after having gloriously identified private and state property, Saint Sancho also makes the state fix the level of wages, is testimony equally to his great consistency and his ignorance of the affairs of this world. The fact that in England, America and Belgium "workers A ho try to gain higher wages by force" are by no means immediately treated as "criminals", but on the contrary quite often actually succeed in obtaining higher wages, is also something of which our saint is ignorant, and which disposes of his whole legend about wages. The fact that, even if the state did not "put itself in the middle", the workers would gain nothing by "seizing" their employers "by the throat" or at any rate much less than through association and strikes, that is, so long as they remain workers and their opponents capitalists — this is also something that could be comprehended even in Berlin. There is likewise no need to demonstrate that bourgeois society, which is based on competition, and its bourgeois state, owing to their whole material basis, cannot permit any struggle among the citizens except the struggle of competition, and are bound to intervene not as "spirit", but with bayonets if people "seize each other by the throat".

Incidentally, Stirner's idea that only the state becomes richer when individuals become richer on the basis of bourgeois property, or that up to now all private property has been state property, is an idea that again puts historical relations upside-down.

— Economic Dependence of the State on the Bourgeoisie —

With the development and accumulation of bourgeois property, i.e., with the development of commerce and industry, individuals grew richer and richer while the state fell ever more deeply into debt. This phenomenon was evident already in the first Italian commercial republics; later, since the last century, it showed itself to a marked degree in Holland, where the stock exchange speculator Pinto drew attention to it as early as 1750, [Isaac Pinto, Lettre sur la Jalousie du Commerce in Traité de la Circulation et du Crédit] and now it is again occurring in England. It is therefore obvious that as soon as the bourgeoisie has accumulated money, the state has to beg from the bourgeoisie and in the end it is actually bought up by the latter. This takes place in a period in which the bourgeoisie is still confronted by another class, and consequently the state can retain some appearance of independence in relation to both of them. Even after the state has been bought up, it still needs money and, therefore, continues to be dependent on the bourgeoisie; nevertheless, when the interests of the bourgeoisie demand it, the state can have at its disposal more funds than states which are less developed and, therefore, less burdened with debts. However, even the least developed states of Europe, those of the Holy Alliance, are inexorably approaching this fate, for they will be bought up by the bourgeoisie; then Stirner will be able to console them with the identity of private and state property, especially his own sovereign, who is trying in vain to postpone the hour when political power will be sold to the "burghers" who have become "angry".

We come now to the relation between private property and right, where we have to listen to the same stuff in another form. The identity of state and private property is apparently given a new turn. Political *recognition* of private property in law is declared to be the *basis* of private property.

"Private property lives by grace of right. It is guaranteed only in right — for possession is not yet property — it becomes mine only with the consent of right; it is not a fact, but a fiction, a thought. That is property by right, rightful property, guaranteed property; it is mine not thanks to me, but thanks to right" (p. 332).

In this passage the previous nonsense about state property merely reaches still more comical heights. We shall, therefore, pass on at once to Sancho's exploitation of the fictitious *jus utendi et abutendi.* [the right of using and consuming (also: abusing), i.e., of disposing of a thing at will] On page 332 we learn, besides the beautiful passage above, that property

"is unlimited power over something which I can dispose of as I please". But "power" is "not something existing of itself, but exists only in the powerful ego, in me, the possessor of power" (p. 366). Hence property is not a "thing", "what is mine is not this tree, but my power over it, my ability to dispose of it" (p. 366). He only knows "things" or "egos". "The power" which is "separated from the ego", given independent existence, transformed into a "spectre", is "right". "This perpetuated power" (treatise on right of inheritance) "is not extinguished even when I die, but is passed on or inherited. Things now really belong not to

me, but to right. On the other hand, this is nothing but a delusion, for the power of the individual becomes permanent, and becomes a right, only because other individuals combine their power with his. The delusion consists in their belief that they cannot take back their power" (pp. 366, 367). "A dog who sees a bone in the power of another dog stands aside only if it feels it is too weak. Man, however, respects the right of the other man to his bone.... And as here, so in general, it is called 'human' when something spiritual, in this case right, is seen in everything, i.e., when everything is made into a spectre and treated as a spectre.... It is human to regard the individual phenomenon not as an individual, but as a universal phenomenon" (pp. 368, 369).

Thus once again the whole mischief arises from the faith of individuals in the conception of right, which they *ought* to get out of their heads. Saint Sancho only knows "things" and "egos", and as regards anything that does not come under these headings, as regards all relations, he knows only the abstract concepts of them, which for him, therefore, also become "spectres". "On the other hand", it does dawn on him at times that all this is "nothing but a delusion" and that the "power of the individual" very much depends on whether others combine their power with his. But in the final analysis everything is nevertheless reduced to the "illusion" that individuals "*believe* that they cannot take back their power". Once again the railways do not "actually" belong to the shareholders, but to the statutes. Sancho immediately puts forward the right of inheritance as a striking example. He explains it not from the necessity for accumulation and from the family which existed before right, but from the *juridical fiction* of the *prolongation of power* beyond death. However, the more feudal society passes into bourgeois society, the more is this juridical fiction itself abandoned by the legislation of all countries. (Cf., for example, the *Code Napoléon*.) There is no need to show here that absolute paternal power and primogeniture — both natural feudal primogeniture and the later form — were based on very definite material relations. The same thing is to be found among ancient peoples in the epoch of the disintegration of the *community* in consequence of the development of *private* life (the best proof of this is the history of the Roman right of inheritance). In general, Sancho could not have chosen a more unfortunate example than the right of inheritance, which in the clearest possible way shows the dependence of right on the relations of production. Compare, for example, Roman and German right of inheritance. Certainly, no dog has ever made phosphorus, bone-meal or lime out of a bone, any more than it has ever "got into its head" anything about its "right" to a bone; equally, it has never "entered the head" of Saint Sancho to reflect whether the right to a bone which people, but not dogs, claim for themselves, is not connected with the way in which people, but not dogs, utilise this bone in production. In general, in this one example we have before us Sancho's whole method of criticism and his unshakeable faith in current illusions. The hitherto existing production relations of individuals are bound also to be expressed as political and legal relations.

(See above a) Within the division of labour these relations are bound to acquire an independent existence over against the individuals. All relations can be expressed in language only in the form of concepts. That these general ideas and concepts are looked upon as mysterious forces is the necessary result of the fact that the real relations, of which they are the expression, have acquired independent existence. Besides this meaning in everyday consciousness, these general ideas are further elaborated and given a special significance by politicians and lawyers, who, as a result of the division of labour, are dependent on the cult of these concepts, and who see in them, and not in the relations of production, the true basis of all real property relations. Saint Sancho, who takes over this illusion without examination, is thus enabled to declare that property by right is the basis of private property, and that the concept of right is the basis of property by right, after which he can restrict his whole criticism to declaring that the concept of right is a concept, a spectre. That is the end of the matter for Saint Sancho. To set his mind at rest, we can add that in all the early law books the behaviour of two dogs who have found a bone is regarded as right: *vim vi repellere licere* [it is permissible to repel force by force], say the Pandects [61]; *idque jus nature comparatur* [and this right is fixed by nature], by which is meant jus quod nature omnia animalia (people and dogs) *docuit* [a right which nature has taught all living beings]; but that later it is "just" the organised repulsion of force by force that becomes right. Saint Sancho, who is now well under way, proves his erudition in the field of the history of right by disputing a "bone" with Proudhon.

Proudhon, he says, "tries to humbug us into believing that society is the original possessor and sole owner of imprescriptible right; that the so-called owner has committed theft with regard to society; that if society takes from any present-day owner his property, it does not steal anything from him, for it is only asserting its imprescriptible right. That is where one can get with the spectre of society as a juridical person" (pp. 330, 331).

In contrast to this Stirner "tries to humbug us into believing" (pp. 340, 367, 420 and elsewhere) that we, viz., the propertyless, presented the owners with their property, out of ignorance, cowardice or good nature, etc., and he calls on us to take back our gift. The difference between these two "attempts at humbugging" is that Proudhon bases himself on a historical fact, while Saint Sancho has only "got something into his head" in order to give the matter a new turn". For recent investigations into the history of right have established that both in Rome and among the German, Celtic and Slay peoples the development of property had as its starting-point communal or tribal property and that private property strictly speaking arose everywhere by usurpation; Saint Sancho could of course not extract this from the profound idea that the concept of right is a concept. In relation to the legal dogmatists, Proudhon was perfectly right when he stressed this fact and in general combated them by means of their own premises. "That is where one can get with the spectre" of the concept of right as a concept. Proudhon could only have been attacked on account of his proposition quoted above if he had defended the earlier and cruder form of property against the private property that had developed out of this primitive communal system. Sancho sums up his criticism of Proudhon in the arrogant question:

"Why such a sentimental appeal for sympathy as if he were a poor victim of robbery?" (p. 420).

Sentimentality, of which, incidentally, not a trace is to be found in Proudhon, is only permitted towards Maritornes. Sancho really imagines that he is a "whole fellow" compared with such a believer in apparitions as Proudhon. He considers his inflated bureaucratic style, of which even Frederick William IV would be ashamed, to be revolutionary. "Blessed are those that believe." On page 340 we learn:

"All the attempts to enact rational laws about property proceeded from the bay of love into a barren ocean of definitions."

A fitting companion to this is the equally bizarre statement:

"Intercourse hitherto has been based on love, on considerate behaviour, on care for one another" (p. 385).

Saint Sancho here surprises himself with a striking paradox about right and intercourse. If, however, we recall that by "love" he understands love of "Man", love of something existing in and for itself, of the universal, that by love he understands the relation to an individual or thing regarded as essence, the holy, then this appearance of brilliance is dissipated. The oracular utterances quoted above are then reduced to the old trivialities which have bored us throughout the "book", i.e., that two things, about which Sancho knows nothing, viz., in this case hitherto existing right and hitherto existing intercourse, are "the holy", and that in general only "concepts have ruled the world" up to now. The relation to the holy, as a rule called "respect", can on occasion also be entitled "love". (See "Logic".) Just one example of how Saint Sancho transforms legislation into a love relation, and trade into a love-affair:

"In a Registration Bill for Ireland, the government put forward the proposal to give the suffrage to those who pay a tax of £5 for the poor. Consequently one who gives alms acquires political rights or, elsewhere, becomes a Knight of the Swan" (p. 344).

It is to be noted here first of all that this "Registration Bill" granting "political rights" was a municipal or corporation Bill or, in more comprehensible language to Sancho, an "urban regulation", which was not designed to grant "political rights" but only urban rights, the right to elect local officials. Secondly, Sancho, who translates

McCulloch, surely ought to know quite well the meaning of "to be assessed to the poor-rates at five pounds". [McCulloch, Statistical Account of the British Empire] This does not mean "to pay a tax of £5 for the poor", but means to be entered on the list of those who pay this tax as the tenants of a house the annual rent of which amounts to £5. Our Berlin bonhomme does not know that the poor-rate in England and Ireland is a local tax which varies in amount in different towns and different years, so that it would be a sheer impossibility to connect any sort of right with the payment of a particular amount of tax. Finally, Sancho believes that the English and Irish poor-rate is an "*alms*"; whereas it only provides funds for a direct and open offensive war of the ruling bourgeoisie against the proletariat. It pays the cost of work-houses which, as is well known, are a Malthusian deterrent against pauperism. We see how Sancho "proceeds from the bay of love into a barren ocean of definitions".

It may be remarked in passing that German philosophy, because it took consciousness alone as its point of departure, was bound to end in moral philosophy, where the various heroes squabble about true morals. Feuerbach loves man for the sake of man, Saint Bruno loves him because he "deserves" it (*Wigand*, p. 137 [Bruno Bauer, "Charakteristic Ludwig Feuerbachs"]), while Saint Sancho loves "everyone", because he likes to do so, with the consciousness of egoism ("the book", p. 387).

We have already seen above — in the first treatise — how the small landed proprietors respectfully excluded themselves from large landed property. This self-exclusion from other people's property, out of respect, is depicted in general as the characteristic of bourgeois property. From this characteristic Stirner is able to explain to himself why it is that

"within the bourgeois system, in spite of its implication that everyone should be an owner, the majority have practically nothing" (p. 348). This "occurs because the majority are pleased if they are owners at all, even if they are merely owners of a few rags" (p. 349).

That the "majority" possess only "a few rags", Szeliga regards as a perfectly natural consequence of their love of rags.

Page 343: "Am I thus nothing but an owner? No, hitherto a person was merely an owner, secure in possession of a plot of land by allowing others also to possess their plot; now, however, everything belongs to me. I am the owner of everything that I need and can take possession of."

Just as Sancho previously made small landed proprietors respectfully exclude themselves from large landed property, and now makes the small landed proprietors exclude one another, so he could go into more detail and make respect responsible for the exclusion of commercial property from landed property, of industrial property from commercial property proper, etc., and thus arrive at a totally new political economy on the basis of the holy. He has only then to get respect out of his head in order to abolish at one stroke division of labour and the form of property that arises from it. Sancho gives an example of this new political economy on page 128 of "the book", where he buys a needle not from a shopkeeper a but from respect, and not with money paid to the shopkeeper, but with respect paid to the needle. Incidentally, the *dogmatic* self-exclusion of each individual from other people's property which Sancho attacks is a purely juridical illusion. Under the modern mode of production and intercourse each person delivers a blow at this illusion and directs his efforts precisely to excluding all others from the property that at present belongs to them. How the matter stands with regard to Sancho's "property in everything" is clear enough from the supplementary clause: "that I need and *can take possession of "* He explains this in more detail on page 353:

"If I say: the world belongs to me, then, properly speaking, this too is empty talk, which has meaning only insofar as I do not respect any property of others";

that is insofar as *non-respect* of the property of others constitutes *his property.*

What irks Sancho about the. private property that is so dear to him is precisely its exclusiveness, without which it would be nonsense — the fact that besides him there are also other private owners. For the private property of others is something holy. We shall see how in his "union" he gets over this inconvenience. We shall find that his egoistical property, property in the extraordinary sense, is nothing but ordinary or bourgeois property transfigured by his sanctifying fantasy.

Let us conclude with the following wisdom of Solomon:

"If people reach a stage where they lose respect for property, then each will possess property ... then [in this matter, too, unions will augment the means of the individual and safeguard his contested property" (p. 342)]."

[Four pages of the manuscript are missing here ... Treatise No. 3. On competition in the ordinary and extraordinary sense.] One morning the writer of these lines, in suitable attire, went to see Herr Minister Eichhorn:

"Since things have come to nothing with the factory-owner" (for the Finance Minister had given him neither a site nor funds to build a factory of his own, and the Minister of justice had not given him permission to take the factory away from the factory-owner — see above on bourgeois property) "I will compete with this professor of law; the man is a blockhead, and I, who know a hundred times more than he does, will take his audience away from him." — "But, my friend, did you study at a university and get a degree?" — "No, but what of that? I fully understand all that is necessary for teaching." — "I'm sorry, but in this matter there is no free competition. I have nothing against you personally, but the

essential thing is lacking — a doctor's diploma — and I, the state, demand it." — "So that is the freedom of competition," sighed the author. "Only the state, my master, gives me the possibility of competing." Whereupon he returned home downcast (p. 347).

In a more advanced country it would not have occurred to him to ask the state for permission to compete with a professor of law. But once he turns to the state as an *employer* and asks for remuneration, i.e., *wages,* thus entering the sphere of competition, then of course after his previous treatises about private property and *privati*, communal property, the proletariat, *lettres patentes,* the state and *status,* etc., one cannot suppose that his "solicitation will be successful". Judging by his past feats, the state can at best appoint him as custodian (*custos*) of "the holy" on some domanial estate in the backwoods of Pomerania.

By way of amusement we can "insert" here "episodically" Sancho's great discovery that there is no "other difference" between the "*poor*" and the "*rich*" "than that between the resourceful [*vermögende*] and the *resourceless* [*unvermögende*]" (p. 354).

Let us plunge once more into the "barren ocean" of Stirner's "definitions" of competition:

"Competition is connected less" (Oh, "less"!) "with the intention of doing a thing as well as possible, than with the intention of making it as profitable, lucrative, as possible. For that reason people study for the sake of a post (bread-and-butter study), cultivate obsequiousness and flattery, routine and knowledge of business; they work for appearance. Hence while apparently it is a matter of a good performance, in reality people aim only at a good stroke of business and monetary gain. Of course, no one wants to be a censor, but people want to get advancement ... people are afraid of being transferred or even more of being dismissed" (pp. 354, 355).

Let our bonhomme discover a textbook on political economy where even theoreticians assert that in competition it is a matter of a "good performance" or "of doing a thing as well as possible" and not of making "it as profitable as possible". Incidentally, in any such book he will find it stated that under the system of private property highly developed competition, for example in England, certainly causes a "thing" to be "done as well as possible". Small-scale commercial and industrial swindling flourishes only in conditions of restricted competition, among the Chinese, Germans and Jews, and in general among hawkers and small shopkeepers. But even hawking is not mentioned by our saint; he only knows the competition of supernumerary officials and school-masters on probation, he reveals himself here as a downright royal-Prussian junior official. He might just as well have given as an example of competition the endeavour of courtiers in every age to win the favour of their sovereign, but that lay much too far beyond his petty-bourgeois field of vision.

After these tremendous adventures with supernumerary officials, salaried accountants and registrars, Saint Sancho experiences his great adventure with the famous horse Clavileño, of which the prophet Cervantes has already spoken in the New Testament, Chapter 41. For Sancho mounts the high horse of political economy and determines the minimum wage by means of "the holy". True, here once again he reveals his innate timidity and at first refuses to mount the flying steed that carries him far above the clouds into the region "where hail and snow, thunder, lightning and thunderbolts are engendered". But the "Duke", i.e., the "state", encourages him and as soon as the bolder and more experienced Szeliga-Don Quixote has swung himself into the saddle, our worthy Sancho climbs behind him on to the horse's crupper. And when Szeliga's hand had turned the peg on the horse's head, the horse soared high into the air and all the ladies — especially Maritornes — cried after them: "May egoism in agreement with itself guide you, valiant knight, and you, still more valiant armour-bearer, and may you succeed in liberating us from the spectre of Malambruno, of 'the holy'. Only keep your balance, valiant Sancho, so that you do not fall and suffer the same fate as Phaeton, when he wanted to drive the chariot of the sun."

"If we assume" (he is already wavering hypothetically) "that just as order belongs to the essence of the state, subordination too is based on its nature" (a pleasant modulation between "essence" and "nature" — the "goats" which Sancho observed during his flight), "then we observe that the underprivileged are excessively overcharged and defrauded by the inferior" (it should probably read superior) "or privileged" (p. 357).

"If we assume ... then we observe." It should read: then we assume. If we assume that "superior" and "inferior" exist in the state, then "we assume" likewise that the former are "privileged" compared with the latter. We can, however, ascribe the stylistic beauty of this sentence, as also the sudden recognition of the "essence" and "nature" of a thing, to the timidity and confusion of our Sancho while anxiously trying to retain his balance during his aerial flight, and to the rockets set alight under his nose. We are not even surprised that Saint Sancho derives the consequences of competition not from competition but from bureaucracy, and once again makes the state determine wages.

He does not take into consideration that the continual fluctuations in wages explode the whole of his beautiful theory; a closer examination of industrial conditions would certainly have provided him with examples of a factory-owner being "overcharged" and "defrauded" by his workers according to the universal laws of competition, if these juridical and moral expressions had not lost all meaning within the framework of competition.

The dwarfish form to which competition has shrunk for Sancho once again demonstrates the naive and petty-bourgeois manner in which world-embracing relations are reflected inside his unique skull, and the extent to which he as a school-master is bound to extract moral applications from all these relations and to refute them with moral postulates. We must give this precious passage *in extenso* "so that nothing should be lost".

"As regards competition again, it exists precisely because not all persons attend to their business and come to an understanding with one another about it. Thus, for example, bread is needed by all the inhabitants of a town; hence they could easily come to an agreement to establish a public bakery. Instead, they leave the supply of bread to competing bakers. Similarly, they leave the supply of great to the butchers, of wine to the wine merchants, etc.... If I do not concern myself with my business, then I have to be content with what it suits others to offer me. To have bread is my business, my wish and desire, and yet people leave it to the bakers, and hope at most, thanks to their contention, rivalry and their attempts to outstrip one another, in a word, thanks to their competition, to get an advantage which people could not count on under the guild-system, when the right to bake bread belonged wholly and solely to the guilds-men" (p. 365).

It is characteristic of our petty bourgeois that he here recommends to his fellow-philistines, in place of competition, an institution like public bakeries, which existed in many places under the guild-system and which were put an end to by the cheaper competitive mode of production. That is to say, he recommends an institution of a local nature, which could only persist under narrowly restricted conditions and was inevitably bound to perish with the rise of competition, which abolished local narrowness. He has not even learned from competition that the "need" of bread, for example, differs from day to day, that it does not at all depend on him whether tomorrow bread will still be "his business" or whether others will still regard his need as their business, and that within the framework of competition the price of bread is determined by the costs of production and not by the whim of the bakers. He ignores all those relations which were brought about by competition: the abolition of local narrowness, the establishment of means of communication, highly developed division of labour, world intercourse, the proletariat, machinery, etc., and regretfully looks back to medieval philistinism. All he knows about competition is that it is "contention, rivalry and attempts to outstrip one another"; he is not concerned about its connection with division of labour, the relation between supply and demand, etc. That the bourgeois, whenever their interests demanded it (and they are better judges of this than Saint Sancho), always "came to an understanding" insofar as this was possible in the framework of competition and private property, is proved by the joint-stock companies, which came into being with the rise of sea-borne trade and manufacture and took possession of all the branches of industry and commerce accessible to them. Such "agreements", which led among other things to the conquest of an empire in the East Indies,[62] are of course a small matter compared with the well-meaning fantasy about public bakeries, which is worthy of being discussed in the *Vossische Zeitung.* As for the proletarians, they — at any rate in the modern form — first arose out of competition; they have already repeatedly set up collective enterprises which, however, always perished because they were unable to compete with the "contending" private bakers, butchers, etc., and because for proletarians — owing to the frequent opposition of interests among them arising out of the division of labour — no other "agreement" is possible than a political one directed against the whole present system. Where the development of competition enables the proletarians to "come to an understanding", they reach an understanding not about public bakeries but about quite different matters. The lack of "agreement" between competing individuals that Sancho notes here entirely corresponds to and contradicts his further exposition of competition, which we can enjoy in the "Commentary" (*Wigand*, p. 173).

"Competition was introduced because it was looked upon as a blessing for all. People came to an agreement about it, attempts were made to approach it jointly ... people agreed about it in much the same way as on a hunting expedition all the hunters taking part... may find it expedient for their purpose to scatter in the forest and to hunt "singly..... True, it now turns out ... that in the case of competition not everyone gets ... his advantage."

"It turns out" that Sancho knows as much about hunting as he knows about competition. He is not speaking about a battue nor about hunting with hounds, but about hunting in the extraordinary sense. It only remains for him to write a new history of industry and commerce according to the above principles, and to set up a "union" for this kind of extraordinary hunting. In the same calm, comfortable style appropriate to a parish magazine he speaks of the relation of competition to morality.

"Those corporeal goods which man as such" (!) "cannot maintain, we have the right to take away from him: this is the meaning of competition, of freedom of industry. Any of the spiritual goods that he cannot maintain devolve likewise upon us. But sanctified goods are inviolable. Sanctified and guaranteed — by whom?... By man or the concept, the concept of the matter under consideration." As such sanctified goods he cites "life", "freedom of the person", "religion", "honour", "sense of decency", "sense of shame", etc. ([Stirner, Der Einzige and sein Eigenthum,] p. 325).

In the advanced countries, Stirner "has the right" to take all these "sanctified goods", although not from "man as such", but from actual men, of course, by means of and under the conditions of competition. The great revolution of society brought about by competition, which resolved the relations of the bourgeois to one another and to the proletarians into purely monetary relations, and converted all the above-named “sanctified goods” into articles of trade, and which destroyed for the proletarians all naturally derived and traditional relations, e.g., family and political relations, together with their entire ideological superstructure — this mighty revolution did not, of course, originate in Germany. Germany played only a passive role in it; she allowed her sanctified goods to be taken from her without even getting the current price for them. Hence our German petty bourgeois knows only the hypocritical assertions of the bourgeoisie about the moral limits of competition observed by the bourgeoisie, which every day tramples underfoot the “sanctified goods” of the proletarians, their “honour”, “sense of shame” and “freedom of the person”, and which even deprives them of religious instruction. These would-be “moral limits” are regarded by Sancho as the true “meaning” of competition, and its reality is excluded from its meaning. Sancho sums up the results of his investigation of competition as follows:

“Is the competition free which the state, this ruler, according to bourgeois principles, cramps by a thousand barriers?” (p. 347).

Sancho’s “bourgeois principles” of everywhere making the “state” the “ruler” and regarding the barriers of competition that arise from the mode of production and intercourse as barriers by which the state” “cramps” competition, are here once more proclaimed with suitable “indignation”. “Recently” Saint Sancho has vaguely heard miscellaneous news “from France” (cf. *Wigand*, p. 190), inter alia, about the objectification of persons in competition and the difference between competition and emulation. But the “poor Berliner” has, “*out of stupidity,* spoilt these fine things” (*Wigand*, ibid., where it is his guilty conscience that speaks). “Thus, for example, he says” on page 346 of “the book":

“Is free competition actually free? Indeed, is it real competition, i.e., competition of persons, as it gives itself out to be, because it bases its right on this title?”

Madame Competition gives herself out to be something, because she (i.e., some lawyers, politicians and petty-bourgeois dreamers, trailing in the tail of her suite) bases bet, right on this title. With this allegory Sancho begins to adapt the “fine things” “from France” to suit the Berlin meridian. We shall skip the absurd assertion already dealt with above that “the state has no objection to make against me personally” and thus allows me to compete, but does not give me the “thing” (p. 347), and we shall pass straight on to his proof that competition is not at all a competition of persons.

“But is it persons who actually compete? No, it is again only things! In the first place — money, etc. There is always one who lags behind the other in the contest. But it makes a difference whether the means that are lacking can be gained through personal power or can only be obtained by grace, as a gift, and

moreover by the poorer, for instance, being forced to leave, I.e., to present, his wealth to the richer" (p. 348).

As for the gift theory, we shall "spare him" [schenken] (*Wigand*, p. 190). Let him look up the chapter on "contract" in any textbook of law and find out whether a "gift" he is "forced to present" is still a gift. In this way, Stirner "presents" us with our criticism of his book, for he "is forced to leave, i.e., to present", it to us.

— Competition —

The fact that of two competitors whose "things" are equal one ruins the other, does not exist for Sancho. That workers compete among themselves, although they possess no "things" (in Stirner's sense) is also a fact that does not exist for him. By doing away with the competition of workers among themselves, he is fulfilling one of the most pious wishes of our "true socialists", whose deepest thanks he is sure to receive. So it is "only things" and not "persons" that compete. Only weapons fight, not the people who use them, and who have learned to wield them. The people are only there to be shot dead. This is how the competitive struggle is reflected in the minds of petty-bourgeois school-masters who, faced with modern stock exchange barons and *cotton-lords*, console themselves with the thought that they only lack the "things" in order to bring their "personal power" to bear against them. This narrow-minded idea appears still more comic if one looks a little more closely at the "things" instead of restricting oneself to the commonest and most popular, e.g., "money (which, however, is not so popular as it seems). These "things" include, among others: that the competitor lives in a country and town, where he enjoys the same advantages as the competitors whom he encounters; that relations between town and countryside have reached an advanced stage of development, that he is competing under favourable geographical, geological and hydrographical conditions; that as a silk manufacturer he carries on his business in Lyons, as a cotton manufacturer in Manchester, or, in an earlier period, as a shipper in Holland; that division of labour in his branch of industry — as in other branches totally independent of him — has become highly developed; that the means of communication ensure him the same cheap transport as his competitors; and that he finds in existence skilful workers and experienced overseers. All these "things", which are essential for competition and in general the ability to compete on the *world market* (which he does not know and cannot know because of his theory of the state and public bakeries, but which, unfortunately, determines competition and the ability to compete), are "things" that he can neither gain by personal power" nor "get presented" to him by "grace" of the "state" (cf. p. 348). The Prussian state, which attempted to "present" all this to the *Seehandlung*,[63] could give him the best instruction or, that subject. Sancho appears here as the royal Prussian philosopher of the *Seehandlung*, by giving a detailed commentary. on the illusion of the Prussian state about its omnipotence and the illusion of the *Seehandlung* about its competitive capacity. Incidentally, competition certainly began as a "competition of persons" possessing "personal means". The liberation of the feudal serfs, the first condition of competition, and the first accumulation of "things" were purely personal" acts. If, therefore, Sancho wishes to put the competition of persons In the place of competition of things, it means that he wishes to return to the beginning of competition, imagining in doing so that by his good will and his extraordinary egoistical consciousness, he can give a different direction to the development of competition.

This great man, for whom nothing is holy, and who is not interested in the "nature of things' and the "concept of the relation", has nevertheless in the end to declare the "nature" of the difference between personal and material to be holy, as also the concept of the relation," between these two qualities and so renounce the role of "creator" in respect of them. The difference — regarded by him as holy — which he notes in the passage quoted, can nevertheless be abolished without thereby committing, the most unmitigated profanation". Firstly, he, abolishes it himself by causing material means to be acquired through personal power and thus converts personal power into material power. He can then calmly address others with the moral postulate that they should adopt a personal attitude to him. In just the same way, the Mexicans could have demanded that the Spaniards should not shoot them with rifles but attack them with their fists or, according to Saint Sancho's proposal, "seize them by the throat" in order to adopt a "personal" attitude to them.

If one person, thanks to good food, careful education and physical exercise, has acquired well-developed bodily powers and skill, while another, owing to inadequate and unhealthy food and consequent poor digestion, and as the result of neglect in childhood and over-exertion, has never been able to acquire the "things" necessary for developing his muscles — not to mention acquiring mastery over them — then the "personal power" of the first in relation to the second is a purely material one. It was not "through personal power" that he gained the "means that were lacking"; on the contrary, he owes his "personal power" to the material means already existing. Incidentally, the transformation of personal means into material means and of material means into personal means is only an aspect of competition and quite inseparable from it. The demand that competition should be conducted not with material means but with personal means amounts to the moral postulate that competition and the relations on which it depends *should have* consequences other than those inevitably arising from them.

Here is yet another, and this time the final summing-up of the philosophy of competition:

“Competition suffers from the drawback that not everyone has the means for competition, because these means are taken not from personality, but from chance. The majority are without means and therefore” (Oh, Therefore!) “impecunious” (p. 349).

It has already been pointed out to him that in competition personality itself is a matter of chance, while chance is personality. The “means” for competition which are independent of personality are the conditions of production and intercourse of the persons themselves, which within the framework of competition appear as an independent force in relation to these persons, as means which are accidental for them. The liberation of people from these forces comes about, according to Sancho, by people getting out of their heads the *ideas* about these forces, or rather the philosophical and religious distortions of these ideas — whether by etymological synonymy (“*Vermögen*” and “*vermögen*”), moral postulates (e.g., let each one be an all-powerful ego), or by making monkey faces and by sentimentally comic bragging against “the holy”.

We have heard the complaint made before that in present-day bourgeois society the “ego”, especially because of the state, cannot realise its value, i.e., cannot bring its “abilities” [Vermögen] into play. Now we learn in addition that “peculiarity” does not give the “ego” the means for competition, that “its might” is no might at all and that it remains “impecunious”, although every object, “being its object, is also its *property*”. It is a complete denial of egoism in agreement with itself. But all these “drawbacks” of competition will disappear, once “the book” has become part of the general consciousness of people. Until then Sancho persists in his trade in thoughts, without however achieving a “good performance” or “doing things as well as possible”.

II. Rebellion

The criticism of society brings to an end the criticism of the old, holy world. By means of *rebellion* we make a leap into the new, egoistical world.

We have already seen in “Logic” what rebellion is in general; it is refusal to respect the holy. Here, however, rebellion acquires in addition a distinct practical character.

Revolution = holy rebellion.

Rebellion = egoistical or wordly revolution.

Revolution = transformation of existing conditions.

Rebellion = transformation of me.

Revolution = a political or social act.

Rebellion = my egoistical act.

Revolution = overthrow of the existing [state of affairs].

Rebellion = existence of overthrow.

Etc., etc. Page 422 et seq. The method hitherto used by people to overthrow the world in which they found themselves had, of course, also to be declared holy, and a peculiar" method of smashing the existing world had to be asserted against it.

Revolution "consists in a transformation of the existing conditions [Zustand — state of affairs] or status, of the state or society; hence it is a political or social act". "Although 'the inevitable consequence" of rebellion "is a transformation of existing conditions, it is not this transformation that is its starting-point, but people's dissatisfaction with themselves". "It is an uprising of individuals, a rising without regard for the arrangements that develop out of it. Revolution aimed at new arrangements; rebellion leads to a position where we no longer allow others to arrange things for us, but arrange things for ourselves. It is not a struggle against what exists, for if it prospers what exists will collapse of itself; it is only the setting free of me from what exists. If I abandon what exists, then it is dead and putrefies. But since my aim is not to overthrow something that exists, but for me to rise above it, my aim and action are not political or social, but egoistical for they are directed solely towards me and my peculiarity" (pp. 421, 422).

Les beaux esprits se rencontrent. [noble minds think alike] That which was proclaimed by the voice crying in the wilderness [Mark 1:3] is now come about. The impious John the Baptist "Stirner" has found his holy Messiah in the shape of "*Dr. Kuhlmann from Holstein*". Listen:

"You should not tear down or destroy what stands in your way, but avoid it and abandon it. And when you have avoided and abandoned it, it will disappear of itself, for it will no longer find sustenance" (Das Reich des Geistes, etc., Genf, 1845. p. 116).

The difference between revolution and Stirner's rebellion is not, as Stirner thinks. that the one .s a political and social act whereas the other is an egoistical act. but that the former is an act whereas the is no act at all. The whole senselessness of the antithesis that Stirner puts forward is evident at once from the fact that he speaks of the Revolution" as a juridical person, which has to fight against "*what exists*", another Juridical person. If Saint Sancho had studied the various actual revolutions and revolutionary attempts perhaps he might even have found in them the forms of which he had a vague inkling when he created his ideological "rebellion"; he might have found them, for example, among the Corsicans, Irish, Russian serfs, and in general among uncivilised peoples. If, moreover, he had concerned himself with the actual individuals “existing” in every revolution, and with their relations, instead of being satisfied with the pure ego and “*what exists*”, i.e., substance (a phrase the overthrow of which requires no revolution,. but merely a knight-errant like Saint Bruno), then perhaps he would have come to understand that every revolution, and its results, was determined by these relations, by needs, and that the “political or social act” was in no way in contradiction to the “egoistical act”. The depth of Saint Sancho’s insight into “revolution” is shown in his statement:

“Although the consequence of rebellion is a transformation of existing conditions [...] this transformation is not its starting-point.”

This implies, by way of antithesis, that the starting-point of the revolution is “a transformation of existing conditions”, i.e., that revolution originates in revolution. “The starting-point” of rebellion, on the other hand, is “people’s dissatisfaction with themselves”. This “dissatisfaction with oneself” fits admirably with the earlier phrases about peculiarity and the “egoist in agreement with himself”, who is always able to go “his own way”, who is always delighted with himself and who at every instant is what he can be. Dissatisfaction with oneself is either dissatisfaction with oneself within the framework of a definite condition which determines the whole personality, e.g., dissatisfaction with oneself as a worker, or it is moral dissatisfaction. In the first case, therefore, it is simultaneously and mainly dissatisfaction with the existing relations; in the second case — an ideological expression of these relations themselves, which does not at all go beyond them, but belongs wholly to them. The first case, as Sancho believes, leads to revolution; for rebellion there remains, therefore, only the second case — *moral* dissatisfaction with oneself. “What exists” is, as we know, “the holy”; hence, “dissatisfaction with oneself” reduces itself to moral dissatisfaction with oneself as a holy one, i.e., one who believes in the holy, in what exists. It could only occur to a discontented school-master to base his arguments about revolution and rebellion on satisfaction and dissatisfaction, moods that belong wholly to the petty-bourgeois circle from which, as we continually find, Saint Sancho derives his inspiration.

We already know what meaning “going beyond the framework of what exists” has. It is the old fancy that the state collapses of itself as soon as all its members leave it and that money loses its validity if all the workers refuse to accept it. Even in a hypothetical form, this proposition reveals all the fantasy and impotence of pious desire. It is the old illusion that changing existing relations depends only on the good will of people, and that existing relations are ideas. The alteration of consciousness divorced from actual relations — a pursuit followed by philosophers as a profession, i.e., as a *business*, is itself a product of existing relations and inseparable from them. This imaginary rising above the world is the ideological expression of the impotence of philosophers in face of the world. Practical life every day gives the lie to their ideological bragging.

In any event, Sancho did not "rebel" against his own state of confusion when he wrote those lines. For him there is the "transformation of existing conditions" on one side, and "people" on the other side, and the two sides are entirely separate from each other. Sancho does not give the slightest thought to the fact that the "conditions" have always been the conditions of these people and it would never brave been possible to transform them unless the people transformed themselves and, if it has to be expressed in this way, unless they became "dissatisfied with themselves" in the old conditions. He thinks he is dealing a mortal blow at revolution when he asserts that it aims at new arrangements, whereas rebellion leads to position where we no longer allow others to arrange things for us, but arrange things for ourselves. But the very fact that "we" arrange things for "ourselves", that it is "we" who rebel, denotes that the individual. despite all Sancho's repugnance", has to "allow" that "we" "arrange things" for him, and that therefore the only difference between revolution and rebellion is that in the former this is known, whereas in the latter people harbour illusions about it. Next Sancho leaves it open whether the rebellion "*prospers*" or not. One cannot understand why it should *not* "prosper", and even less why it should prosper, since each rebel goes his own way. Worldly conditions would have to intervene to show the rebels the necessity of a *joint* act, one which would be "political or social", irrespective of whether it arises from egoistical motives or not. A further "trashy distinction", based again on confusion, is that drawn by Sancho between the "overthrow" of what exists and "rising" above it, as though in overthrowing what exists he does not rise above it, and in rising above it, he does not overthrow it, if only insofar as it exists in him himself. Incidentally, neither "overthrow" by itself nor "rising" by itself tells us anything; that "rising" also take place in revolution Sancho could have seen from the fact that "*Levons-nous!*"[64] was a well-known slogan in the French Revolution.

"Revolution bids" (!) "us to create institutions, rebellion urges us to rise or rise up. [Einrichtung — arrangement, institution; sich aufrichten and emporrichten — to stand up, to raise oneself, to rise] Revolutionary minds were occupied with the choice of a constitution, and the entire political period teems with constitutional struggles and constitutional questions, just as socially-gifted persons revealed extraordinary inventiveness as regards social institutions (phalansteries and such-like). To be without a constitution is the endeavour of the rebel" (p. 422).

That the French Revolution brought institutions in its train is a fact; that *Empörung* is derived from the word *empor* [Empörung — rising, rebellion; empor — up, upwards] is also a fact . that during the revolution and after it people fought for constitutions is another fact, and equally so that various social systems were outlined; and it is no less a fact that Proudhon spoke about anarchy. From these five facts Sancho has concocted the above-quoted passage.

From the fact that the French Revolution led to “Institutions”, Sancho concludes that this is a “bidding” of revolution in general. From the fact that the political revolution was a political one in which the social transformation had also an official expression in the form of constitutional struggles, Sancho — faithfully following his history-broker [i.e. Bruno Bauer] — deduces that in it people fought over the best constitution n. To this discovery he links, by means of the words “just as”, a mention of social systems. In the epoch of the bourgeoisie, people occupied themselves with constitutional questions, “just as” in recent times various social systems have been devised. This is the train of thought in the above-quoted passage.

It follows from what was said above against Feuerbach that previous revolutions within the framework of division of labour were bound to lead to new political institutions; it likewise follows that the communist revolution, which removes the division of labour, ultimately abolishes political institutions ; and, finally, it follows also that the communist revolution will be guided not by the “social institutions of inventive socially-gifted persons”, but by the productive forces.

But “to be without a constitution is the endeavour of the rebel"! He who is “born free”, who is from the outset rid of everything, endeavours at the end of time to get rid of the constitution.

It should be mentioned also that all sorts of earlier illusions of our bonhomme contributed to Sancho’s concept of “rebellion”. They include, among others, his belief that the individuals who make a revolution are linked by some ideal bond and that their “raising the standard of revolt” is limited to inscribing on it a new concept. fixed idea, spectre, or apparition — the holy. Sancho makes them get this ideal bond out of their heads, whereby in his imagination they become a disorderly mob which can now only “rebel”. In addition, he has heard that competition is a war of all against all, [Hobbes, De Cive] and this proposition, mixed with his desanctified revolution, constitutes the main factor of his “rebellion”.

“When, for the sake of clarity, I try to think of a comparison, there comes to my mind, against my expectation, the foundation of Christianity” (p. 423). “Christ”, we learn here, “was not a revolutionary but a rebel who rose. Therefore, he was concerned about one thing alone: ‘be ye wise as serpents’”. (ibid.).

In order to suit the “expectation” and the “alone” of Sancho the second half of the biblical text quoted (Matthew 10: 16) “and harmless as doves” ought not to exist. Christ has to figure here for the second time as a historical person in order to play the same role as the Mongols and Negroes played above. Whether Christ is meant to clarify the rebellion or the rebellion to clarify Christ is not known. The Christian-

German gullibility of our saint is concentrated in the statement that Christ "drained the sources of life of the entire heathen world, and without *them*" (this ought to read: without him) "the existing state was anyway bound to wither" (p. 424). A withered flower of pulpit eloquence! See above on the "ancients". For the rest, *credo ut intelligam*, [I believe in order to understand. — Anselm of Canterbury] or, in order to find a "comparison for the sake of clarity".

Countless examples have already shown us that everywhere nothing but *sacred* history comes into our saint's mind and, indeed, in precisely those passages where the reader "has not expected" it. "Against expectation" it occurs to him again even in the "Commentary", where Sancho on page 154 makes the "Judaic reviewers" in ancient Jerusalem exclaim in opposition to the Christian definition "God is love": "Thus You see that it is heathen God that is proclaimed by the Christians; for if God is love, then he is the God Amor, the God of love! " — "Against expectation", however, the New Testament was written in Greek, and the "Christian definition" reads: o qeos agaph estin [God is love] (1 John 4:16), whereas "the God Amor, the God of love" is called "Erws. Sancho has, therefore, still to explain how it is that the "Judaic reviewers" were able to achieve the transformation of agaph into erws. In this passage of the "Commentary", Christ — again "for the sake of clarity" — is compared with Sancho, and at any rate it must be admitted that they have a striking resemblance to each other, both are "corpulent beings" and the joyful heir at least believes in the existence, or the uniqueness, of both of them. Sancho is the modern Christ, at this "fixed idea" of his the whole historical construction is "aimed".

The philosophy of rebellion, which has just been presented to us in the form of bad antitheses and withered flowers of eloquence, is in the final analysis only a boastful apology for the parvenu system (parvenu, Emporkömmling, Emporgekommener, Empörer [pun on Stirner's synonymy: Emporkömmling — upstart, Emporgehommener — one who has raised himself up, and Empörer — rebel]). Every rebel in his "egoistical act" is faced by a particular existing reality, over which he endeavours to rise, without regard to the general conditions. He strives to get rid of the existing world only insofar as it is a fetter, for the rest, he endeavours, on the contrary, to appropriate it. The weaver who "rises" to become a factory-owner thereby gets rid of his loom and abandons it; for the rest, the world goes on as before and our "prosperous" rebel offers to others only the hypocritical moral demand that they should become parvenus like himself. Thus, all Stirner's belligerent rodomontades end in moral deductions from Gellert's fables and speculative interpretations of middle-class wretchedness.

So far we have seen that rebellion is anything you like, except action. On page 342 we learn that

"the procedure of seizure is not contemptible, but expresses the pure action of the egoist in agreement with himself".

This should surely read: of egoists in agreement *with one another,* since otherwise seizure amounts to the uncivilised "procedure" of thieves or to the civilised "procedure" of the bourgeois, and in the first case does not prosper, while in the second case it is not rebellion". It is to be noted that corresponding to the egoist in agreement with himself, who does nothing, we have here the "*pure*" act, certainly the only act which could be expected from such an inactive individual. We learn by the way what created the plebs, and we can be sure in advance that it was created by a "dogma", and faith in that dogma, in the holy, a faith which here for a change appears as consciousness of sin:

"Seizure is a sin a crime — this is the dogma that alone creates a plebs ... the old consciousness of sin alone is to blame" (p. 342).

The belief that consciousness is to blame for everything is his dogma, which makes him a rebel and the plebs a sinner. In contrast to this consciousness of sin, the egoist incites himself, respectively the plebs, to seizure as follows:

"I tell myself: where my power extends, that is my property, and I claim as my property everything that I feel strong enough to reach," etc. (p. 340).

Thus, Saint Sancho tells himself that he wants to tell himself something, calls on himself to have what he has, and formulates his real relation as a relation of power — a paraphrase which in general is the secret of all his rodomontades. (See "Logic") Then he — who at each instant is what he can be, and therefore has what he can have — distinguishes his realised, actual property, which he has in his capital account, from his possible property, his unrealised "feeling of strength", which he enters in his profit and loss account. This is a contribution to the science of book-keeping of property in the extraordinary sense. The meaning of his solemn "telling" was revealed by Sancho in a passage already quoted:

"I tell myself ... then that is, properly speaking, empty talk."

Sancho continues:

"Egoism" says "to the propertyless plebs" in order to "exterminate" it: "Seize and take what you need!" (p. 341).

How "empty" this "talk" is can be seen at once from the following example:

"I as little regard the wealth of the banker as something alien, as Napoleon did the lands of the kings. We" ("I" is suddenly transformed into "we") "are not at all afraid to conquer this wealth, and we also seek the means to do so. Thus, we divest it of its alien character which we were afraid of" (p. 369).

How little Sancho has "divested" the wealth of the banker of its "alien character" he proves at once by his well-meaning advice to the plebs to "conquer" it by seizure. "Let him seize and see what is left in his hands! " Not the wealth of the banker but useless paper, the "corpse" of that wealth which is no more wealth than "a dead dog is a dog". The wealth of the banker is wealth only in the framework of the existing relations of production and intercourse and can be "conquered" only in the conditions of these relations and with the means which are valid for them. And if Sancho were to turn to some other wealth, he would find that the prospect was no better. Thus, the "pure act of the egoist in agreement with himself" amounts in the final analysis to an extremely impure misunderstanding. "That is where one can get with the spectre" of the holy.

Having told himself what he wanted to tell himself, Sancho makes the rebellious plebs say what he has prompted it to say. The fact is that in case of a rebellion he has drawn up a proclamation together with instructions as to its use, which should be posted up in all village ale-houses and distributed throughout the countryside. The proclamation claims a place in *Der hinkende Bottle* [65] and in the Duchy of Nassau's country almanac. For the time being Sancho's *tendances incendiaires* are limited to the countryside, to propaganda among agricultural labourers and dairy maids, not touching the towns, which is a further proof of the extent to which he has "divested" large-scale industry of its "alien character". Nevertheless we should like here to give as detailed an account as possible of this valuable document, which ought not to be lost, in order "to contribute to the spread of a well-deserved fame insofar as it lies in our power" (*Wigand*, p. 191).

The proclamation is printed on page 358 et seq. [of "the book"] and begins as follows:

"But what is it due to that your property is safe, you privileged ones?... It is due to the fact that we refrain from attacking, consequential, it is due to our protection.... It is due to the fact that you use force against us."

First it is due to the fact that we refrain from attacking, i.e., to the fact that we use force *against ourselves,* and then to the fact that you use force against *us*. *Cela va à merveille!* Let us continue.

"If you desire our respect, then buy it at a price acceptable to us.... We only want good value."

First the "rebels" want to sell their respect at an "acceptable price" and then they make "good value" the criterion of the price. First an arbitrary price, then a price determined independently of arbitrariness by commercial laws, by the costs of production and the relation between supply and demand.

"We agree to leave you your property provided you properly compensate this leaving.... You will shout about force if we help ourselves.... without force we shall not get them" (i.e., the oysters that the privileged enjoy)....... We intend taking nothing from you, nothing at all."

First we "leave" it to you, then we take it away from you and have to use "force", and finally we prefer taking nothing from you after all. We leave it to you in the event of your giving it up yourself; in a moment of enlightenment, the only one we have, we see that this "leaving" amounts to "helping oneself" and use of "force", but in the end we cannot be reproached with "taking" anything from you. And there the matter must rest.

"We toil for twelve hours in the sweat of our brows and you offer us a few pence for it. In that case you should take an equal amount for your work too.... No equality at all!

The "rebellious" agricultural labourers reveal themselves as true Stirnerian "creations".

"You do not like that? You imagine that our work is more than adequately paid with those wages, but that yours, on the other hand, deserves a wage of several thousand. But if you did not put such a high value on Your work and allowed us to realise a better value for ours, we would, if need be, achieve something more important than you do for many thousand taler, and if You received only such wages as ours, you would soon become more diligent in order to earn more. If you were to do something that appears to us to be ten and a hundred times more valuable than our own work, ah" (ah, — you good and faithful servant!) "then you should get a hundred times more for it; we, for our part, are also thinking of making you things for which you will pay us more than the usual daily wage."

First the rebels complain that they are paid too little for their work. At the end, however, they promise that only if they receive a higher daily wage, they will perform work for which it will be worth paying more than the usual daily wage". Further, they believe they would achieve extraordinary things if only they were to receive better wages, although at the same time they expect extraordinary achievements from the capitalist only if his " wage" is reduced to the level of theirs. Finally, after having performed the economic feat of transforming profit — this necessary form of capital, without which they would perish together with the capitalist — into wages, they perform the miracle of paying "a hundred times more" than they receive for "their own work", i.e., a hundred times more than they earn. "This is the meaning" of the above phrase, if Stirner "means what he says". But if this is only a stylistic error on his part, if the rebels intend jointly to offer the capitalist a hundred times more than *each of them* earns, then Stirner is only making them offer the capitalist what each capitalist already has nowadays. For it is clear that the work of the capitalist, in combination with his capital, is worth ten or a hundred times more than that of a single person who is merely a worker. Hence in this case, as always, Sancho leaves everything as it was before.

"We shall get on with one another if only we agree that no one any longer needs to present anything to someone else. Then we shall presumably go as far as to pay a decent price even to cripples, the sick and the aged, to prevent them from dying of hunger and want, for if we wish them to live it is fitting that we should pay for the fulfilment of our desire. I say pay for, hence I do not mean any miserable alms."

This sentimental episode about cripples, etc., is intended to prove that Sancho's rebellious agricultural labourers have already "risen" to those heights of middle-class consciousness where they do not wish to present anything or be presented with anything, and where the,,, consider that the dignity and interests of the two parties in a relation .ire assured as soon as this relation is turned into a purchase. This thunderous proclamation of the people who, in Sancho's imagination, are in rebellion, is followed by directions for its use in the form of a dialogue between a landowner and his labourers, the master this time behaving like Szeliga and the labourers like Stirner. In these directions the English strikes and the French workers' coalitions are interpreted *a priori* in the Berlin manner.

Spokesman of the labourers: "What have you got?"

Landowner: "I have an estate of 1,000 morgen,"

"And I am your labourer and henceforth I will only cultivate your land for a wage of a taler a day.

Landowner: "In that case I shall hire someone else."

Spokesman: "You won't find anyone, for we labourers will not work in future on any other conditions, and if you find anyone who agrees to take less, let him beware of us. Even a servant-girl now demands as much, and you will no longer find anyone for a lower wage."

Landowner: "Oh! Then I shall be ruined!"

Labourers (in chorus): "Don't be in such a hurry! You are sure to get as much as we get. And if not, we'll deduct sufficient for You to live like us, — We are not talking of equality!"

Landowner: "But I am accustomed to better living!"

Labourers: "We have nothing against that, but that's not our concern; if you can save more, all right. Do we have to hire ourselves out at a reduced price so that you can live well?"

Landowner: "But you uneducated people do not need so much!"

Labourers: "Well, we shall take a little more so as to be able to get the education that we may, perhaps, need."

Landowner: "But if you ruin the rich, who will support the arts and sciences?"

Labourers: "Well, our numbers must see to that. We'll all contribute, it will make a good round sum. Anyway, you wealthy people now buy only the trashiest books and pictures of tearful madonnas or a pair of nimble dancer's legs."

Landowner: "Oh, miserable equality!"

Labourers: "No, dear worthy master, we are not talking of equality! We only want to be appraised according to our worth, and if you are worth more, then after all you will also be appraised more highly. We only want good value and intend to show ourselves worth the price you will pay."

At the end of this dramatic masterpiece Sancho admits that, of course, "unanimity of the labourers" will be "required". How this will come about we are not told. What we do learn is that the agricultural labourers have no intention of changing in any way the existing relations of production and intercourse, but merely want to _force the landowner to yield them the amount by which his expenditure exceeds theirs. It is a matter of indifference to our well-meaning bonhomme that this excess of expenditure, if distributed over the mass of the proletarians, would give each of them a mere trifle and not improve his position in the slightest. The stage of development of agriculture to which these heroic labourers belong becomes evident immediately after the conclusion of the drama, when they are transformed into "domestic servants". They are living, therefore, under patriarchal conditions in which division of labour is still very little developed, and in which, incidentally, the whole conspiracy "will reach its final goal" by the landowner taking the spokesman into a barn and giving him a thrashing, whereas in more civilised countries the capitalist ends the matter by closing his enterprise for a time and letting his workers go and "play". Sancho's highly practical way of constructing his work of art, his strict adherence to the limits of probability, is evident not only from his peculiar idea of arranging a turn-out of agricultural labourers, but especially from his coalition of "servant-girls". And how complacent to imagine that the price of corn on the world market will depend on the wage demands of these agricultural labourers from Further Pomerania and not on the relation between supply and demand! A real sensation is caused by the surprising discourse of the labourers about literature, the latest art exhibition and the fashionable dancer of the day, surprising even after the unexpected question of the landowner about art and science. They become quite friendly as soon as they touch on this literary subject and for a moment the harassed landowner even forgets his threatened ruin in order to demonstrate his *dévoûment* to art and science. Finally the rebels give him an assurance of their upright character and make the reassuring statement that they are guided neither by vexatious interests nor subversive tendencies, but by the highest moral motives. All they ask is price according to worth and they promise on their honour and conscience to be worthy of the higher price. All this has the sole aim of ensuring for each his own, his honest and fair earnings, "honestly earned pleasure". That this price depends on the state of the labour-market, and not on the moral rebellion of a few literary-minded agricultural labourers, is, of course, a fact which our worthy folk could not be expected to know.

These rebels from Further Pomerania are so modest that despite their "unanimity", which gives them the power to do something very different, they prefer to remain servants with the "wage of a taler a day" as their highest desire. It is quite consistent, therefore, that they do not cross-examine the landowner, who is in their power, but he cross-examines them.

The "firm spirit" and "strong self-consciousness of the domestic servant" find expression also in the "firm", "strong" language in which he and his comrades speak. "Perhaps — well — our numbers *must* see to that — a good round sum — dear worthy master — after all." Previously we read in the proclamation: "If need be — ah — we *are thinking* of making — perhaps, maybe, etc." One would think that the agricultural labourers had also mounted the wonderful steed Clavileño.

Our Sancho's whole noisy "rebellion", therefore.. reduces itself in the final analysis to a turn-out, but a turn-out in the extraordinary sense, viz., a turn-out on Berlin lines. Whereas in civilised countries the real turn-out plays a smaller and smaller role in the labour movement, because the more widespread association of workers leads to other forms of action, Sancho tries to depict the petty bourgeois caricature of a turn-out as the ultimate and highest form of the world-historic struggle.

The waves of rebellion now cast us on the shore of the promised land, flowing with milk and honey, where every true Israelite sits beneath his fig-tree and where the millennium of "agreement" has dawned.

III. Union

In the section on rebellion we first of all collected examples of Sancho's bragging, and then traced the practical course of the "pure act of the egoist in agreement with himself". With regard to "union", we shall do the opposite: we shall first of all examine the actual institutions and then compare them with the illusions of our saint about them.

1. Landed Property

"If we no longer wish to leave the land to the landed proprietors, but want to appropriate it for ourselves, then we unite to this end and form a union, société" (society), "which makes itself the owner, if we are successful, the landed proprietors cease to be such." The "land" will then be the "property of the conquerors.... And the attitude to the land of these individuals collectively will be no less arbitrary than that of an isolated individual or so-called propriétaire. Hence, in this case too, property continues to exist, and indeed even as 'exclusive' property, since mankind, that great society, excludes the individual from its property, leasing to him, perhaps, only a part of it, as a reward.... So it remains and so it will come to be. That in which all want to have a share will be taken away from the individual who wants to have it for himself alone and turned into common property. Since it is common property each has his share in it and this share is his property. Thus in our old conditions, a house belonging to five heirs is likewise their common property; one-fifth part of the income, however, is the property of each of them" (pp. 329, 330).

After our brave rebels have formed a union, a society, and in this form have won a portion of land for themselves, this "*société*", *this* juridical person, "makes *itself*" the "*proprietor*". To avoid any misunderstanding, he adds at once that "this society *excludes* the individual from the property, leasing to him, perhaps, only a part of it, as a reward". In this way Saint Sancho appropriates for himself and his "union" his notion of communism. The reader will recall that Sancho in his ignorance reproached the communists for wanting to make society the supreme owner that gives each individual his "property" in feudal tenure. Further, Sancho offers his recruits the prospect of a "share in the common property". On a later occasion, this same Sancho says, again against the communists:

"Whether wealth belongs to the whole community, which allows me a portion of it, or to separate owners, for me the compulsion is the same, since in both cases I am powerless to decide about it"

(for this reason, too, his "collective" "takes away" from him what it does not want him to have in his exclusive possession, and so makes him feel the power of the collective will).

Thirdly, we here again encounter the "exclusiveness" with which he has often reproached bourgeois property, so that "even the miserable spot on which he stands does not belong to him". On the contrary, he has only the right and power to squat on it as a miserable and oppressed corvée peasant.

Fourthly, Sancho here appropriates the feudal system which, to his great annoyance, he has discovered in all hitherto existing or proposed forms of society. The "society," of conquerors behaves much as did the "unions" of semi-barbarian Germans who conquered the Roman provinces and introduced there a crude feudal system which was still strongly alloyed with the old tribal mode of life. It gives every individual a piece of land "as a reward". At the stage where Sancho and the sixth-century Germans are, the feudal system still coincides in many respects with the system of "reward".

It goes without saying, incidentally, that the tribal property which Sancho here restores afresh to honour would be bound before long to be dissolved again in the conditions now existing. Sancho feels this himself, for he exclaims: "So it *remains* and" (a beautiful "and"!) "so it *will come to be*", and finally, he proves — by his great example of the house belonging to five heirs — that he has not the slightest intention of going outside the framework of our old relations. His whole plan for the organisation of landed property has only the aim of leading us by 'historical detour back to petty-bourgeois hereditary tenure and the family, property of German imperial towns.

Of our old relations, i.e., those now existing, Sancho has appropriated only the legal nonsense that individuals, or *propriétaires*, behave "arbitrarily" in relation to landed property. In the union", this imagined "arbitrariness" is to be continued by society". To the "union" it is so much, a matter of indifference what happens to the land that "perhaps" "society" leases plots of land to individuals, or perhaps not. All that is quite immaterial.

Sancho, of course, cannot know that a definite structure of agriculture is linked lo a definite form of activity and determined by a definite stage of the division of labour. But anyone else can see how little the small corvée peasants, as proposed here by, Sancho, are in a position where "each of them can become an omnipotent ego", and how little their ownership of a miserable plot of land resembles the greatly praised "ownership of everything". In the real world, the intercourse of individuals depends on their mode of production, and therefore Sancho's "perhaps" completely overthrows — perhaps — his whole union. But "perhaps", or rather undoubtedly, there emerges here Sancho's real view concerning intercourse in the union, namely, the view that the basis of egoistical intercourse is the holy.

Sancho brings to light here the first "institution" of his future union. The rebels who strove to be "without a constitution", "arrange things for themselves", by "choosing" for themselves a "constitution" of landed property. We see that Sancho was right in not placing any brilliant hopes in new "Institutions". At the same time, however, we see that he ranks highly among the "socially-gifted persons" and is "extraordinarily inventive in regard to social institutions".

2. Organisation of Labour

"The organisation of labour concerns only such work as can be done for us be others, such as cattle-slaughtering, ploughing, etc.; other work remains egoistical because, for example, no one can compose your music for you, complete the sketches for your paintings, etc. No one can do Raphael's works for him. These are works of a unique individual which only this unique person is capable of producing, whereas the former work deserves to be called human" (on page 356 this is made identical with "generally useful"), "since peculiarity is of little consequence here and almost every person can be trained to do it" (p.

"It is always expedient for us to come to an agreement about human labour, in order that it should not claim all our time and effort, as is the case under competition,.... For whom, however, should time be gained? For what purpose does a human being need more time than is required to restore his exhausted labour-power? To this communism gives no reply. For what purpose? In order to enjoy himself as the unique, having done his share as a human being" (pp. 356, 357).

"Through work I can fulfil the official duties of a president, minister, etc.; these posts require only a general education, namely, the education that is generally accessible.... Although, however, anyone could occupy these posts, it is only the unique power of the individual, peculiar to him alone, that gives them, as it were, life and significance. For performing his duties not as an ordinary man would do, but by exerting the power of his uniqueness, he does not get paid, if lie is paid only as an official or minister. If he has acted to your satisfaction, and you wish for your benefit to retain this power of the unique person, which is worthy of gratitude, then you ought to pay him not simply as a man who performs a merely human task. but as one who accomplishes something unique" (pp. 362, 363),

"If you are in a position to afford joy to thousands of people, then thousands will remunerate you for it; for it is in your power not to do it and therefore they have to pay you for the fact that you do it" (p. 351).

"One cannot establish any general rate of payment forms, uniqueness, as can be done for work I perform as a man. Only for the latter can a tariff be fixed. Therefore you may fix a general tariff for human work, but do not deprive your uniqueness, of what is due to it" (p. 363).

As an example of the organisation of labour in the union, the public bakeries already mentioned are cited on page 365. Under the conditions of vandal parcellation presupposed above, these public institutions must be a real miracle.

First of all human labour must be organised and thereby shortened so that Brother Straubinger,[66] having finished his work early, can "enjoy himself as the unique" (p. 357), but on page 363 the "enjoyment" of the unique one 's reduced to his extra earnings.

On page 363 it is stated that the vital activity of the unique person does not have to take place subsequently to human labour; the latter can be performed as unique labour, and in that case it requires an additional wage. Otherwise the unique one, who is interested not in his uniqueness but in a higher wage, could shelve his uniqueness and to spite society be satisfied with acting as an ordinary person, at the same time playing a trick on himself.

According to page 356, human labour coincides with generally useful labour, but according to pages 351 and 363 unique labour shows its worth by being paid for additionally as generally useful or, at least, useful to many people.

Thus, the organisation of labour in the union consists in the separation of human labour from unique labour, in the establishment of a tariff for the former and in haggling for an additional wage for the latter. This addition is again twofold, one part being for the unique performance of *human* labour and the other for the unique performance of *unique* labour. The resulting bookkeeping is the more complicated because what was unique labour yesterday (e.g., spinning cotton thread No. 200) becomes human labour today, and because the unique performance of human labour requires a continual *moucharderie* [spying] upon oneself in one's own interest and universal *moucharderie* in the public interest. Hence this whole great organisational plan amounts to a wholly petty-bourgeois appropriation of the law of supply and demand, which exists at present and has been expounded by ail economists. The law which determines the price of those types of labour that Sancho declares unique (e.g., that of a dancer, a prominent physician or lawyer), he could have found already explained by Adam Smith, and a tariff fixed for it by the American Cooper. Modern economists explain on the basis of this law the high payment for what they call *travail improductif* and the low wages of the agricultural day-labourer, and in general all inequalities in wages. Thus, with God's help, we have again arrived at competition, but a competition which has so much come down in the world that Sancho can propose a fixed rate, the establishment of wages by law, as was the case of old in the fourteenth and fifteenth centuries.

It deserves mention also that the idea which Sancho puts forward here is also to be found as something completely new in the Herr Messiah — Dr. Georg Kuhlmann of Holstein.

What Sancho here calls human labour is, apart from his bureaucratic fantasies, the same thing as is usually meant by machine labour, labour which, as industry develops, devolves more and more on machines. True, because of ‘the above-described organisation of landownership, machines are an impossibility in the "union" and therefore the corvée peasants in agreement with themselves prefer to reach an agreement with one another about this work. As regards "presidents" and "ministers", Sancho — this poor localised being, as Owen puts it — forms his opinion only by his immediate environment.

Here, as always, Sancho is again unlucky with his practical examples. He thinks that "no one can compose your music for you, complete the sketches for your paintings. No one can do Raphael's works for him". Sancho could surely have known, however, that it was not Mozart himself, but someone else who composed the greater part of Mozart's *Requiem* and finished it, [67] and that Raphael himself "completed" only an insignificant part of his own frescoes.

He imagines that the so-called organisers of labour[68] wanted to organise the entire activity of each individual, and yet it is precisely they who distinguish between directly productive labour, which has to be organised, and labour which is not directly productive. In regard to the latter, however, it was not their view, as Sancho imagines, that each should do the work of Raphael, but that anyone in ‘ whom there is a potential Raphael should be able to develop without hindrance. Sancho imagines that Raphael produced his pictures independently of the division of labour that existed in Rome at the time. ff he were to compare Raphael with Leonardo da Vinci and Titian, he would see how greatly Raphael's works of art depended on the flourishing of Rome at that time, which occurred under Florentine influence, while the works of Leonardo depended on the state of things in Florence, and the works of Titian, at a later period, depended on the totally different development of Venice. Raphael as much as any other artist was determined by the technical advances in art made before him, by the organisation of society and the division of labour in his locality, and, finally, by the division of labour in all the countries with which his locality had intercourse. Whether an individual like Raphael succeeds in developing his talent depends wholly on demand, which in turn depends on the division of labour and the conditions of human culture resulting from it.

In proclaiming the uniqueness of work in science and art, Stirner adopts a position far inferior to that of the bourgeoisie. At the present time it has already been found necessary to organise this "unique" activity. Horace Vernet would not have had time to paint even a tenth of his pictures if he regarded them as works which "only this unique person is capable of producing". In Paris, the great demand for vaudevilles and novels brought about the organisation of work for their production; this organisation at any rate yields something better than its "unique" competitors in Germany. In astronomy, people like Arago, Herschel, Encke and Bessel considered it necessary to organise joint observations and only after that obtained some moderately good results. In historical science, it is absolutely impossible for the "unique" to achieve anything at all, and :in this field, too, the French long ago surpassed all other nations thanks to organisation of labour. Incidentally, it is self-evident that all these organisations based on modern division of labour still lead to extremely limited results, and they represent a step forward only compared with the previous narrow isolation.

Moreover, it must be specially emphasised that Sancho confuses the organisation of labour with communism and is even surprised that "communism" gives him no reply to his doubts about this organisation. just like a Gascon village lad is surprised that Arago cannot tell him on which star God Almighty has built his throne.

The exclusive concentration of artistic talent in particular individuals, and its suppression in the broad mass which is bound up with this, is a consequence of division of labour. Even if in certain social conditions, everyone were an excellent painter, that would by no means exclude the possibility of each of them being also an original painter, so that here too the difference between "human" and "unique" labour amounts to sheer nonsense. In any case, with a communist organisation of society. there disappears the subordination of the artist to local and national narrowness, which arises entirely from division of labour, and also the subordination of the individual to some definite art, making him exclusively a painter, sculptor, etc.; the very name amply expresses the narrowness of his professional development and his dependence on division of labour. In a communist society there are no painters but only people who engage in painting among other activities.

Sancho's organisation of labour shows clearly how much all these philosophical knights of "substance" content themselves with mere phrases. The subordination of "substance" to the "subject" about which they all talk so grandiloquently, the reduction of "substance" which governs the "subject" to a mere "accident" of this subject, is revealed to be mere "empty talk". Hence they wisely refrain from examining division of labour, material production and material intercourse, which in fact make individuals subordinate to definite relations and modes of activity. For them it is in general only a matter of finding new phrases for 'Interpreting the existing world-phrases which are the more certain to consist only of comical boasting, the more these people imagine they have risen above the world and the more they put themselves in opposition to it. Sancho is a lamentable example of this.

3. Money

“Money is a commodity and indeed an essential means or faculty, for it protects wealth against ossification, keeps it fluid and affects its circulation. If you know of a better means of exchange, all right., but it too will be a variety of money” (p. 364).

On page 353 money is defined as “marketable property or property in circulations.

Thus the “union” retains money, this purely social property which has been stripped of all individuality. The extent to which Sancho is in the grip of the bourgeois outlook is shown by his question about a better means of exchange. Consequently, he first of aft assumes that a means of exchange is necessary, and moreover he knows of no other means of exchange except money. The fact that ships and railways, which serve to transport commodities, are also means of exchange does not concern him. Hence in order to speak not merely of means of exchange, but particularly of money, he has to include the other attributes of money; that it is a means of exchange that is universally marketable and in circulation, that it keeps all property fluid, etc. These bring in also economic aspects which Sancho does not know but which actually constitute money; and with them the whole present situation, class economy, domination of the bourgeoisie. etc.

First of all, however, we learn something about the — extremely odd — course of monetary crises in the union.

The question arises:

“Where is money to be obtained?... People pay not with money, of which there may be a shortage, but with their ability [Vermögen], thanks to which alone we are wealthy [vermögend].... it is not money that harms you, but your inability [Unvermögen] to obtain it.”

Now comes the moral exhortation:

“Let your ability [Vermögen] have its effect, brace yourself, and you will not lack money [Geld], your money, money of your coining.... Know then that you have as much money as you have power; for the extent to which You can assert yourself [Dir Geltung verschaffst] determines how much you are worth [giltst]"(pp. 353, 364) [Geld — money; sich Geltung verschaffen — to assert oneself; gelten — to be worth]

The power of money, the fact that the universal means of exchange becomes independent in relation both to society and to individuals, reveals most clearly that the relations of production and intercourse as a whole assume an independent existence. Consequently, Sancho as usual knows nothing about the connection of money relations with production in general and intercourse. As a good citizen, he unhesitatingly keeps money in force; indeed it could not be otherwise with his 'view of division of labour and the organisation of landed ownership. The material power of money, which is strikingly revealed in monetary crises and which, in the form of a permanent scarcity of money, oppresses the petty bourgeois who ;s "inclined to make purchases", is likewise a highly unpleasant fact for the egoist in agreement with himself. He gets rid of the difficulty by reversing the ordinary idea of the petty bourgeois, thus making it appear that the attitude of individuals to the power of money is something that depends solely on their personal willing or running. This fortunate turn of thought then gives him the chance of reading a moral lecture, buttressed by synonymy, etymology and vowel mutation, to the astounded petty bourgeois already disheartened by lack of money, thus debarring in advance all inconvenient questions about the causes of the pecuniary embarrassment.

The monetary crisis consists primarily in the fact that all "wealth" [*Vermögen*] suddenly becomes depreciated in relation to the means of exchange and loses its "power" [*Vermögen*] over money. A crisis is in existence precisely when one *can* no longer pay with one's "wealth" [*Vermögen*], but *must* pay with money. And this again does not happen because of a shortage of money, as is imagined by the petty bourgeois who judges the crisis by his personal difficulties, but because the specific difference becomes fixed between money as the *universal* commodity, the "marketable property and property in circulation", and all the other, *particular* commodities, which suddenly cease to be marketable property. It cannot be expected that, to please Sancho, we shall analyse here the causes of this phenomenon. Sancho first of all consoles the moneyless and hopeless small shopkeepers by saying that it is not money that causes the scarcity of money and the . whole crisis, but their inability to obtain it. It is not arsenic that is to blame for someone dying who takes it, it is the inability of his organism to digest it.

After first defining money as an essential and indeed *specific* form of wealth [*Vermögen*], as the universal means of exchange, money in the ordinary sense, Sancho suddenly turns the thing round when he sees the difficulties this would lead to and declares all ability, [*Vermögen*] to be money, in order to create the appearance of personal power. The difficulty during a crisis is precisely that "all wealth" [*Vermögen*] has ceased to be "money". Incidentally, this amounts to the practice of the bourgeois who accepts "all wealth" as means of payment so long as it is money, and who only begins to raise difficulties when it becomes difficult to turn this "wealth" into money in which case he also ceases to regard it as "wealth". Further, the difficulty in time of crisis is precisely that you, petty bourgeois, whom Sancho addresses here, can no longer put into circulation the money of your coining, your bills of exchange; but you are expected to pay with money, not coined by you and which shows no evidence that it has passed through your hands.

Finally, Stirner distorts the bourgeois motto "You are worth as much as the money you possess" into "You have as much money as you are worth", which alters nothing, but only introduces an appearance of personal power and thus expresses the trivial bourgeois illusion that everyone is himself to blame if he has ne, money. Thus Sancho disposes of the classic bourgeois saying: *L'argent n'a pas de maitre* [money has no master], and can now mount the pulpit and exclaim: "Let your ability have its effect, brace yourself, and you will not lack money." *Je ne connais pas de lieu à la bourse où se fasse le transfers des bonnes intentions* [I do not know a place at the stock exchange where people trade in good intentions]. He had but to add: Obtain credit; *knowledge is power* ; it is harder to earn the first taler than the last million; be moderate and save your money and, most important of all, do not multiply overmuch, etc. — to reveal not one ass's ear, but both at once. In general, the man for whom everyone is what he can be and does what he can do, ends all chapters with moral exhortations.

The monetary system in Stirner's union is, therefore, the existing monetary system expressed in the euphemistic and gushingly sentimental manner of the German petty bourgeois.

After Sancho has paraded in this way with the ears of his ass, Don Quixote-Szeliga draws himself up to his full height and delivers a solemn speech about the modern knight-errant, in the course of which money is transformed into Dulcinea del Toboso and the manufacturers and *commerçants en masse* into knights, namely, into *chevaliers d'industrie.* The speech has also the subsidiary aim of proving that because money is an "essential means", it is also essentially a daughter".* And he stretched out his right hand and said:

"On money depends fortune and misfortune. In the bourgeois period it is a force because like a maiden" (a dairymaid; per appositionem Dulcinea) "it is only wooed but is not indissolubly joined in marriage to anyone. All the romance and chivalry of wooing a dear object is revived in competition. Money, an object of ardent desire, is abducted by the bold chevaliers d'industrie" (p. 364).

Sancho has now arrived at a profound explanation why money in the bourgeois epoch is a power, namely, because in the first place fortune and misfortune depends on it and, secondly, because it is a *maiden.* He has further learned why he can lose his money, namely, because a maiden is not indissolubly joined in marriage to anyone. Now the poor wretch knows where he stands. Szeliga, who has thus made the burgher into a knight, now in the following way makes the communist into a burgher and indeed into a burgher husband.

"He on whom fortune smiles leads the bride home. The ragamuffin is fortunate, he takes her into his household, society, and destroys the maiden. In his home she is no longer a bride, but a wife, and her maiden name disappears with her

maidenhood. As a housewife, the money-maiden is called labour, for labour is the name of the husband. She is the property of the husband.

"To complete the picture, the child of labour and money is again a girl" ("essentially a daughter"), "an unmarried girl" (has Szeliga ever known of a girl coming "Married" out of the maternal womb?) "and therefore money" (according to the above proof that all money is an "unmarried girl", it is self-evident that "all unmarried girls" are "money") — "therefore money, but having its definite descent from labour, its father" (toute recherche de la paternité est interdite [any investigation regarding paternity is forbidden — the formula used in article 340 of the Code Napoléon]). "The shape of the face, the image, bears a different stamp" (pp. 364, 365).

This story of marriage, burial and baptism is surely of itself sufficient proof that it is "essentially a daughter" of Szeliga, and indeed a daughter of "definite descent". Its ultimate basis, however, lies in the ignorance of his former stableman, Sancho. This is clearly seen at the end, when the orator is again anxiously concerned about the "coining" of money. thereby betraying that he still considers that coins are the most important medium of circulation. If he had taken the trouble to examine a little more closely the economic relations of ,none Y, instead of weaving a beautiful. leafy bridal wreath for it, he would have known that — without mentioning state securities, shares, etc. — the major part of the medium of circulation consists of bills of exchange, whereas paper money forms a comparatively small part, and coin a still smaller part. In England, for example. fifteen times as much money circulates in the form of bills of exchange and bank-notes as in the form of coin. And even as regards coin, it is determined exclusively by the costs of production, i.e., labour. Hence Stirner's elaborate process of procreation was superfluous here.

Szeliga's solemn reflections about a means of exchange based on labour but, nevertheless', different from the money of today, which he claims to have discovered among certain communists, only prove once again the simplicity with which our noble couple believe everything they read without even examining it.

When the two heroes ride homewards after this "knightly and romantic" campaign of "wooing", they are bringing back no "fortune", still less the "bride", and least of all "money", but at best one "ragamuffin" is bringing home the other.

---

4. State

We have seen that Sancho retains in his "union" the existing form of landownership, division of labour and money, in the way in which a petty bourgeois conceives these relations in his imagination. It is clear at a glance that with such premises Sancho cannot do without the state.

First of all his newly acquired property will have to assume the form of guaranteed, legal property. We have already heard his words:

"That in which all want to have a share will be taken away from the individual who wants to have it for himself alone" (p. 330).

Here, therefore, the will of the whole community is enforced against the will of the separate individual. Since each of the egoists in agreement with themselves may turn out to be not in agreement with the other egoists and thus become involved in this contradiction, the collective will must also find some means of expression in relation to the separate individuals —

"and this will is called the will of the state" (p. 257).

Its decisions are then *legal* decisions. The enforcement of this collective will in its turn requires repressive measures and public power.

"In this matter also" (in the matter of property) "the unions will multiply the means of the individual and safeguard his disputed property" (they guarantee, therefore, guaranteed property, i.e., legal property, i.e., property that Sancho possesses not "unconditionally", but "holds on feudal tenure" from the "union") (p. 342).

Obviously, the whole of civil law is re-established along with the relations of property, and Sancho himself, for example, sets forth the theory of contract fully in the spirit of the lawyers, as follows:

"It is of no importance, too, that I deprive myself of one or other freedom, for example, through any contract" (p. 409).

And in order to "safeguard" "disputed" contracts, it will also "be of no importance" if he has again to submit himself to a court and to all the actual consequences of a civil court case.

Thus, "little by little out of the twilight and the night" we come closer again to the existing relations, but only as these relations exist in the dwarfish imagination of the German petty bourgeois.

Sancho admits:

"In relation to freedom there is no essential difference between state and union. The latter cannot arise and exist without restricting freedom in various ways just as the state is incompatible with boundless freedom. Restriction of freedom is

always unavoidable, for it is impossible to get rid of everything; one cannot fly like a bird just because one would like to fly, etc.... In the union there will still be a fair amount of compulsion and lack of freedom, for its aim is not freedom which, on the contrary, it sacrifices for the sake of peculiarity, but only for the sake of peculiarity" (pp. 410, 411).

Leaving aside for the time being the strange distinction between freedom and peculiarity, it should be noted that Sancho, without intending to do so, has already sacrificed his "peculiarity" in his union owing to its *economic* institutions. As a true "believer in the state", he sees a restriction only where political institutions begin. He lets the old society continue in existence and with it also the subordination of individuals to division of labour; in which case he cannot escape the fate of having a special "peculiarity" prescribed for him by the division of labour and the occupation and position in life that falls to his lot as a result of it. If, for example, it fell to his lot to work as an apprentice fitter in Willenhall, [69] then the "peculiarly" imposed on him would consist in a twisted hip-bone resulting in a "game leg"; if the "title spectre [Marie Dähnhardt, Stirner's wife] of his book" [70] has to exist as a female throstle spinner, then her "peculiarity" would consist in stiff knees. Even if our Sancho continues his old vocation of a corvée peasant, already assigned to him by Cervantes, and which he now declares to be his own vocation, which he calls upon himself to fulfil, then, owing to division of labour and the separation of town and countryside, he will have the "peculiarity" of being a purely local animal cut off from all world intercourse and, consequently, from all culture.

Thus, in the union, owing to its social organisation, Sancho *malgré lui* loses his peculiarity if, by way of exception, we take peculiarity in the sense of individuality. That owing to its political organisation, he then surrenders his freedom as well is quite consistent and only shows still more clearly how much he strives to retain the present state of affairs in his union.

Thus, the essential distinction between freedom and peculiarity constitutes the difference between the present state of affairs and the "union". We have already seen how essential this distinction is. The majority of the members of the union, too, will possibly not be particularly embarrassed by this distinction and will hasten to decree their "riddance" from it, and if Sancho is not satisfied with that, they will show him on the basis of his own "book" that, firstly, there are no essences, but that essences and essential differences are "the holy"; secondly, that the union does not have to trouble about the "nature of the matter" and the "concept of the relation"; and, thirdly, that they in no way encroach on his peculiarity but only on his freedom to express it. They will perhaps prove to him, if it is his "endeavour to be without a constitution", that they restrict only his freedom by putting him in prison, striking blows at him, or tearing off his leg, and that he remains partout *et* toujours "peculiar", so long as he is still able to show the signs of life of a polyp, an oyster or even a galvanised dead frog. They will "set a definite price" on his work, as we have already heard, and "will not allow a truly *free*" (!) "realisation of his property", for thereby they restrict only his freedom, not h . is peculiarity. These are things for which Sancho, on page 338, reproaches the state. "What then should" our corvée peasant Sancho "do? He should be firm and pay no attention" to the union (ibid.). Finally whenever he begins to grumble about the restrictions imposed on him, the majority will suggest that so long as he has the peculiarity of declaring that freedoms are peculiarities, they can take the liberty of regarding his peculiarities as freedoms.

Just as the difference mentioned above between human and unique labour was only a miserable appropriation of the law of supply and demand, so now the difference between freedom and peculiarity is a miserable appropriation of the relation between the state and civil society or, as Monsieur Guizot says, between *liberté individuelle* and *pouvoir public*. This is so much the case that in what follows he can copy Rousseau' almost word for word.

"The agreement [...] according to which everyone must sacrifice a part of his freedom" occurs "not at all the sake of something universal or even for the sake of another person", on the contrary, "I only concluded it out of self-interest. As far as sacrificing is concerned, after all I merely sacrifice what is not in power, i. e. I sacrifice nothing at all" (p. 418).

Our corvée peasant in agreement with himself shares this quality with all other corvée peasants and, in general, with every individual, who has ever lived on the earth. Compare also Godwin, *Politica; Justice.*

Incidentally, Sancho appears to possess the peculiarity, of imagining that according to Rousseau individuals concluded the contract for the sake of the universal, which never entered Rousseau's head.

One consolation, however, remains for him.

"The state is holy ... the union, however, is ... not holy." And herein lies the "great difference between the state and the union" p. 411).

The whole difference, therefore, amounts to this, that the union is the actual modern state, and the "state" is Stirner's illusion about the Prussian state, which he confuses with the state in general.

---

5. Rebellion

Sancho quite rightly has so little faith in his subtle distinctions between state and union, holy and not holy, human and unique, peculiarity and freedom, etc., that in the end he takes refuge in the *ultima ratio* of the egoist in agreement with himself —

in rebellion. This time, however, he rebels not against himself, as he earlier asserted, but against the union. just as earlier Sancho sought to achieve clarity on all points in the union, so he does here, too, as regards rebellion.

"If the community treats me unjustly, I rebel against it and defend my property" (p. 343)

If the rebellion does not "prosper", the union will "expel (imprison, exile, etc.) him" (pp. 256, 257).

Sancho here tries to appropriate the *droits de 1'homme* of 1793, which included the right of insurrection [71] -a human right that, of course, bears bitter fruits for him who tries to make use of it at his " own" discretion.

Thus Sancho's whole union amounts to the following. Whereas in his previous criticism he regarded existing relations only from the aspect of illusion, when speaking of the union he tries to get to know the actual content of these relations and to oppose this content to the former illusions. In this attempt, our ignorant school-master was of i course bound to fall ignominiously. By way of exception, he did once endeavour to appropriate the "nature of the matter" and the "concept of the relation", but he failed to "divest" any matter or any relation of its "alien character".

Now that we have become acquainted with the union in its real form, it only remains for us to examine Sancho's enthusiastic ideas about it, i.e., the religion and philosophy of the union.

---

6. Religion and Philosophy of the Union

Here we again start from the point at which, above, we began the description of the union. Sancho employs two categories: property and wealth; the illusions about property correspond mainly to the positive data given on landed property, the illusions about wealth to the data on the organisation of labour and the monetary system in the union.

A. Property

Page 331: "The world belongs to me."

Interpretation of his hereditary tenure of a plot of land.

Page 343: "I am the owner of everything that I need",

a euphemistic way of saying that his needs are his possession and that what he needs as a corvée peasant is determined by his circumstances. In the. same way the economists maintain that the worker is the owner of everything that he needs as a worker. See the discourse on the minimum wage in Ricardo. [David Ricardo, On the Principles of Political Economy and Taxation]

Page 343: "Now, however, everything belongs to me."

A musical flourish in honour of his rate of wages, his plot of land, his permanent lack of money, and his expulsion from everything that the "society" does not want him to have in exclusive possession. The same idea occurs on page 327, expressed thus:

"His" (i.e., of another person) "possessions are mine and I dispose of them as the owner to the extent of my power."

This pompous *allegro marciale* passes in the following way into a gentle cadence, in which it gradually collapses on its backside — Sancho's usual fate:

Page 331: "The world belongs to me. Do You" (communists) "say anything different with your opposite thesis: the world belongs to all? All are I, and once more I, etc." (for example, "Robespierre, for example. Saint-Just, and so on").

Page 415: "I am I and you are I, but ... this I, in which we are all equal, is only my thought [...] a generality" (the holy).

The practical variation on this theme occurs on page 330, where the "individuals collectively" (i.e., all) are counterposed as a regulating force to the "Isolated individual" (i.e., the I as distinct from all). These dissonances are at last resolved in the soothing final chord, to the effect that what I do not possess is at any rate the property of another "ego". Thus, "ownership of everything" is only an interpretation of the statement that each person possesses exclusive property.

Page 336: "But property is only my property if I have unconditional possession of it. As the unconditional ego, I have property, I carry on free trade."

We already know that only freedom, and not peculiarity, is affected if freedom of trade and unconditionality are not respected in the union. "Unconditional property" is a fitting supplement to the secure", guaranteed property in the union.

Page 342: "In the opinion of the communists, the community should be the owner. On the contrary, I am the owner and only come to an agreement with others about my property."

On page 329 we saw how "the *société* makes itself the *owner*" and on page 330 how it "excludes *individuals* from its property". In general, we saw that the tribal system of feudal tenure, the crudest beginnings of the system of feudal tenure, was introduced. According to page 416, the "feudal system = absence of property"; hence, according to the same page, "property is recognised in the union, and only in the union", and moreover for a conclusive reason: "because no one any longer holds his possession in feudal tenure from any being [*Wesen*]" (ibid.). That is to say, under the hitherto existing' feudal system, the feudal lord was this "being", in the union it is the *société*. From this one may at least conclude that Sancho possesses an "exclusive" but by no means "secure" property in the "essence" [*Wesen*] [Wesen can mean "being" or "essence"], of past history. In connection with page 330, according to which each individual' is excluded from that which society does not consider it right for him to hold in his sole possession, and in connection with the state and legal system of the union, it is stated:

Page 369: "The rightful and legitimate property of another will only be that which you consider it right to recognise as his property. If you no longer consider it right, it loses its rightfulness for you and You will deride any claim to absolute right in it."

He thus proves the astounding fact that what is right in the union does not have to be right for him — an Indisputable right of man. If there exists in the union the institution of the old French parliaments, which Sancho loves so much, then he can even have his dislike recorded and deposit the document in the office of the law courts, consoling himself with the thought that lone cannot get rid of everything". These various statements appear to contradict themselves, one another and the actual state of things in the union. But the key o this riddle is to be found 'n the juridical fiction, already mentioned, that when Sancho is excluded from the property of others, he is merely coming to an agreement with these others. This fiction is expounded in more detail in the following statements:

Page 369: "This" (i.e., respect for the property of others) "comes to an end when I can leave the tree in question to another, just as I leave my stick, etc., to another, but do not from the outset regard it as something alien, i. e., holy. Rather ... it remains my property, no matter for what period I cede it to another; it is mine and remains mine. see nothing alien in the wealth belonging to the banker."

Page 328: "I do not retreat timidly before thy and your property, but always regard it as my property, which I do not need to respect at all. just do the same with what you call my property. With this point of view we shall most easily reach agreement with one another."

If, according to the rules of the union, Sancho is "given a drubbing" as soon as he tries to seize another's property, he will, of course, maintain that pilfering is a "peculiarity" of his; nevertheless, the union will decide that Sancho has merely taken a "liberty". And if Sancho takes the "liberty" of attempting to seize another's possessions, the union has the "peculiarity" of sentencing him to a flogging for it.

The essence of the matter is this. Bourgeois and, particularly, petty-bourgeois and small-peasant property is, as we have seen, retained in the union. Merely the *interpretation*, the "*point of view*", is different, for which reason Sancho always lays stress on the way of "regarding". "Agreement" is reached when this new philosophy of regarding enjoys the regard of the whole union. This philosophy consists of the following. Firstly, every relation, whether caused by, economic conditions or direct compulsion, is regarded as a relation of "agreement". Secondly, it is imagined that all property belonging to others is relinquished to them by us and remains with them only until we have the power to take it from them; and if we never get the power, *tant mieux*. Thirdly, Sancho and his union in theory guarantee each other absence of respect, whereas in practice the. union "reaches agreement" with Sancho with the aid of a stick. Finally, this "agreement" is a mere phrase, since everyone knows that the others enter into it only with the secret reservation that they will reject it on the first convenient occasion, I see in your property something that is not yours but mine; since every ego does likewise, they see in it the universal, by which we arrive at the modern-German philosophical interpretation of ordinary, special and exclusive private property.

The union's philosophy of property includes, *inter alia*, the following fancies derived from Sancho's system:

On page 342, that property can be acquired in the union through, absence of respect; on page 351, that "we are all in the midst of "abundance", and "have only to help myself to as much as I can" whereas in actual fact the whole union belongs to Pharaoh's seven lean kine[72] and finally, that Sancho "cherishes thoughts" which arc written in his book; and which are sung on page 374 in the incomparable ode addressed to himself imitating Heine's three odes to Schlegel: "*You, who* cherishes such thoughts as are written in your. book ... you cherish nonsense" Such is the hymn which for the time being Sancho addresses to himself, and about which the union will later "reach agreement" with him.

Finally, it is obvious even without reaching "agreement" that property in the extraordinary sense, about which we already spoke in the "Phenomenology", is accepted in the union in lieu of payment, as "marketable" property and "property in circulation". Concerning simple facts, e.g., that I feel sympathy, that I talk to others, that my leg is amputated (or torn off), the union will reach agreement that "the feeling experienced by sentient beings is also mine, my property" (p. 387); that other people's ears and tongues are Likewise my property, and that mechanical relations too are my property.

Thus, appropriation in the union will consist chiefly in all relations being transformed into property relations by means of a facile paraphrase. This new mode of expressing "evils" that are already now rife is an "essential means or faculty" in the union and will successfully make up for the deficit in the means of existence that is inevitable in view of Sancho's "social gifts".

B. Wealth

Page 216: "Let each of you become an omnipotent ego!"

Page 353: "Think about increasing your wealth!"

Page 420: "Keep up the value of your gifts;

"Keep up their price,

"Do not allow yourself to be compelled to sell below the price,

"Do not allow yourself to be persuaded that your commodity is not worth the price,

"Do not make yourself ridiculous by a ridiculously low price,

"Follow the example of the courageous man, etc.!

Page 420: "Increase the value of your property!"

"Increase your value"

These moral sayings, which Sancho learned from an Andalusian Jewish huckster who drew up rules of life and trade for his son, and which Sancho now pulls out of his knapsack, form the main wealth of the union. The basis of all these statements is the great proposition on page 351:

"Everything that you are able to do [vermagst — inflected form of vermögen] is your wealth [Vermögen]."

This proposition is either meaningless, i. e., mere tautology, or is nonsense. It is tautology if it means: what you are able to do, you are able to do. It is nonsense if *Vermögen* No. 2 is meant to denote wealth "in the ordinary sense", commercial wealth, and if the proposition is based, therefore, on the etymological similarity. The collision consists precisely in the fact that what is expected of my ability [*Vermögen*] is different from what it is capable of doing, c. g., it is demanded of my ability to write verses that it should make money out of these verses. My ability is expected to produce something quite different from the specific product of this special ability, viz., a product depending on extraneous conditions which are not subject to my ability. This difficulty is supposed to be resolved in the union by means of etymological synonymy. We see that our egoistical school-master hopes to occupy an important post in the union. Incidentally, this difficulty is only an apparent one. The usual pithy moral saying of the bourgeois: "*Anything is good to make money of*", is here expounded at length in Sancho's solemn manner.

C. Morality, Intercourse, Theory of Exploitation

Page 352: "You behave egoistically when you regard one another neither as owners nor as ragamuffins or workers, but as part of your wealth, as useful creatures. Then you will not give anything either to the owner, the proprietor, for his property, or to the one who works, but only to him whom you can make use of. Do we need a king? the North Americans ask themselves, and they reply: 'He and his work are not worth a farthing to us',"

On the other hand, on page 229, he reproaches the "bourgeois period" for the following:

"Instead of taking me as I am. attention is paid only to my property, my qualities, and a marriage alliances is concluded with me only for the sake of what I possess. The marriage is concluded, so to speak, with what I have and not with what I am."

That is to say, attention is paid solely to what I am for others, to my usefulness, I am dealt with as a useful creature. Sancho spits into the "bourgeois period's" soup, so that in the union he alone can devour it. If the individuals of modern society regard one another as owners, as workers and, if Sancho wishes, as ragamuffins, this only means that they treat one another as useful creatures, a fact which can only be doubted by such a useless individual as Sancho. The capitalist, who "regards" the worker "as a worker", shows consideration for him only because he needs workers; the worker treats the capitalist in the same way, and the Americans too, in Sancho's opinion (we would like him to point out the source from which he took this historic fact), have no use for a king, *because* he is useless to them *as a worker*. Sancho has chosen his example with his usual clumsiness, for it is supposed to prove exactly the opposite of what it actually proves.

Page 395: "For me, you are nothing but food, just as I am eaten up and consumed by you. We stand in only one relation to one another: that of usefulness, utility, use."

Page 416: "No one is to me a person to be held in respect, not even my fellow-man; but, like other beings" (!), "he is solely an object, for which I may or may

not have sympathy, an interesting or uninteresting object, a useful or useless creature.”

The relation of “usefulness”, which is supposed to be the *sole* relation of the individuals to one another in the union, is at once paraphrased as “*eating*” one another. The “perfect Christians” of the union, of course, also celebrate holy communion, only not by eating together but by eating one another.

The extent to which this theory of mutual exploitation, which Bentham expounded *ad nauseam*, could already at the beginning of the present century be regarded as a phase of the previous one is shown by Hegel in his *Phänomenologie*. See there the chapter “The Struggle of Enlightenment with Superstition”, where the theory of usefulness is depicted as the final result of enlightenment. The apparent absurdity of merging all the manifold relationships of people in the *one* relation of usefulness, this apparently metaphysical abstraction arises from the fact that in modern bourgeois society all relations are subordinated in practice to the one abstract monetary-commercial relation. This theory came to the fore with Hobbes and Locke, at the same time as the first and second English revolutions, those first battles by which the bourgeoisie won political power. it is to be found even earlier, of course, among writers on political economy, as a tacit presupposition. Political economy is the real science of this theory of utility; it acquires its true content among the Physiocrats, since they were the first to treat political economy systematically. In Helvétius and Holbach one can already find an idealisation of this doctrine, which fully corresponds to the attitude of opposition adopted by the French bourgeoisie before the revolution. Holbach depicts the entire activity of individuals in their mutual intercourse, e. g., speech, love, etc., as a relation of utility and utilisation. Hence the actual relations that are presupposed here are speech, love, definite manifestations of definite qualities of individuals. Now these relations are supposed not to have the meaning *peculiar* to them but to be the expression and manifestation of some third relation attributed to them, the *relation of utility or utilisation*. This *paraphrasing* ceases to be meaningless and arbitrary only when these relations have validity for the individual not on their own account, not as spontaneous activity, but rather as disguises, though by no means disguises of the category of Utilisation, but of an actual third aim and relation which is called the relation of utility.

The verbal masquerade only has meaning when it is the unconscious or deliberate expression of an actual masquerade. In this case, the utility relation has a quite definite meaning, namely, that I derive benefit for myself by doing harm to someone else (*exploitation de 1'homme par l'homme*, [exploitation of man by man.” See Doctrine de Saint-Simon. Exposition. Première année]); in this case moreover the use that I derive from some relation is entirely extraneous to this relation, as we saw above in connection with ability [*Vermögen*] that from each ability a product alien to it was demanded, a relation determined by social relations — and this is precisely the relation of utility. All this is actually the case with the bourgeois. For him only one relation is valid on its own account — the relation of exploitation; all other relations have validity for him only insofar as he can include them under this one relation; and even where he encounters relations which cannot be directly subordinated to the relation of exploitation, he subordinates them to it at least in his imagination. The material expression of this use is money which represents the value of all things, people and social relations. Incidentally, one sees at a glance that the category of "utilisation" is first abstracted from the actual relations of intercourse which I have with other people (but by no means from reflection and mere will) and then these relations. are made out to be the reality of the category that has been abstracted from them themselves, a wholly metaphysical method of procedure. In exactly the same way and with the same justification, Hegel depicts all relations as relations of the objective spirit. Hence Holbach's theory is the historically justified philosophical illusion about the bourgeoisie just then developing in France, whose thirst for exploitation could still be regarded as a thirst for the full development of individuals in conditions of intercourse freed from the old feudal fetters. Liberation from the standpoint of the bourgeoisie, i. e., competition, was, of course, for the eighteenth century the only possible way of offering the individuals a new career for freer development. The theoretical proclamation of the consciousness corresponding to this bourgeois practice, of the consciousness of mutual exploitation as the universal mutual relation of all individuals, was also a bold and open step forward. It was a kind of enlightenment which interpreted the political, patriarchal, religious and sentimental embellishment of exploitation under feudalism in a secular way; the embellishment corresponded to the form of exploitation existing at that time and it had been systematised especially by the theoretical writers of the absolute monarchy.

Even if Sancho had done the same thing in his "book" as Helvétius and Holbach did in the last century, the anachronism would still have made it ridiculous. But we have seen that in the place of active bourgeois egoism he put a bragging egoism in agreement with itself.

His sole service — rendered against his will and without realising it — was that he expressed the aspirations of the German petty bourgeois of today whose aim it is to become bourgeois. It was quite fitting that the petty, shy and timid behaviour of these petty bourgeois should have as its counterpart the noisy, blustering and impertinent public boasting of "the unique" among their philosophical representatives. It is quite in accordance with the situation of these petty bourgeois that they do not want to know about their theoretical loud-mouthed champion, and that he knows nothing about them; that they are at variance with one another, and he is forced to preach egoism in agreement with itself. Now, perhaps, Sancho will realise the sort of umbilical cord that connects *his* "union" with the Customs Union.[73]

The advances made by the theory of utility and exploitation, its various phases are closely connected with the various periods of development of the bourgeoisie. In the case of Helvétius and Holbach, the actual content of the theory never went much beyond paraphrasing the mode of expression of writers belonging to the period of the absolute monarchy. It was a different method of expression which reflected the desire to reduce all relations to the relation of exploitation and to explain the intercourse of people from their material needs and the ways of satisfying them, rather than the actual realisation of this desire. The problem was set. Hobbes and Locke had before their eyes not only the earlier development of the Dutch bourgeoisie (both of them had lived for some time in Holland) but also the first political actions by which the English bourgeoisie emerged from local and provincial limitations, as well as a comparatively highly developed stage of manufacture, overseas trade and colonisation. This particularly applies to Locke, who wrote during the first period of the English economy, at the time of the rise of joint-stock companies, the Bank of England and time of England's mastery of the seas. In their case, and particularly in that of Locke, the theory of exploitation was still directly connected with the economic content.

Helvétius and Holbach had before them, besides English theory and the preceding development of the Dutch and English bourgeoisie, also the French bourgeoisie which was still struggling for its free development. The commercial spirit, universal in the eighteenth century, had especially in France taken possession of all classes in the form of speculation. The financial difficulties of the government and the resulting disputes over taxation occupied the attention of all France even at. that time. In addition, Paris in the eighteenth century was the only world city, the only city where there was personal intercourse among individuals of all nations. These premises, combined with the more universal character typical of the French in general, gave the theory of Helvétius and Holbach its peculiar universal colouring, but at ,he same time deprived it of the positive economic content that was still to be found among the English. The theory which for the English was still simply the registration of facts becomes for the French a philosophical system. This generality devoid of positive content, such as we find it in Helvétius and Holbach, is essentially different from the substantial comprehensive view which is first found in Bentham and Mill. The former corresponds to the struggling, still undeveloped bourgeoisie, the latter to the ruling, developed bourgeoisie.

The content of the theory of exploitation that was neglected by Helvétius and Holbach was developed and systematised by the Physiocrats — who worked at the same time as Holbach — but because their basis was the undeveloped economic relations of France where feudalism, under which landownership plays the chief role, was still unshaken, they remained in thrall to the feudal outlook insofar as they declared landownership and land cultivation to be that [productive force] which determines the whole structure of society.

The theory of exploitation owes its further development in England to Godwin, and especially to Bentham. As the bourgeoisie succeeded in asserting itself more and more both in England and in France, the economic content, which the French had neglected, was gradually re-introduced by Bentham. Godwin's *Political Justice* was written during the terror, and Bentham's chief works during and after the French Revolution and the development of large-scale industry in England. The complete union of the theory of utility with political economy is to be found, finally, in Mill.

At an earlier period political economy had been the subject of inquiry either by financiers, bankers and merchants, i.e., in general by persons directly concerned with economic relations, or by persons with an all-round education like Hobbes, Locke and Hume, for whom it was of importance as a branch of encyclopaedic knowledge. Thanks to the Physiocrats, political economy for the first time was raised to the rank of a special science and has been treated as such ever since. As a special branch of science it absorbed the other relations — political, juridical, etc. — to such an extent that it reduced them to economic relations. But it regarded this subordination of all relations to itself as only one aspect of these relations, and thereby allowed them for the rest an independent significance outside political economy. The complete subordination of all existing relations to the relation of utility, and its unconditional elevation to the sole content of all other relations, occurs for the first time in Bentham's works, where, after the French Revolution and the development of large-scale industry, the bourgeoisie is no longer presented as a special class, but as the class whose conditions of existence are those of the whole society.

When the sentimental and moral paraphrases, which for the French were the entire content of the utility theory, had been exhausted, all that remained for its further development was the question how individuals and relations were to be used, to be exploited. Political economy had meanwhile already provided the answer to this question; the only possible advance consisted in the inclusion of the economic content. Bentham achieved this advance. Political economy, however, had already given expression to the fact that the chief relations of exploitation are determined by production in general, independently of the will of individuals, who find them already in existence. Hence, no other field of speculative thought remained for the utility theory than the attitude of individuals to these important relations, the private exploitation of an already existing world by individuals. On this subject Bentham and his school indulged in lengthy moral reflections. The whole criticism of the existing world by the utility theory was consequently restricted within a narrow range. Remaining within the confines of bourgeois conditions, it could criticise. only those relations which had been handed down from a past epoch and were an obstacle to the development of the bourgeoisie. Hence, although the utility theory does expound the connection of all existing relations with economic relations, it does so only in a restricted way.

From the outset the utility theory had the aspect of a theory of general utility, yet this aspect only became fraught with meaning when economic relations, especially division of labour and exchange, were included. With division of labour, the private activity of the individual becomes generally useful; Bentham's general utility becomes reduced to the same general utility which is asserted in competition as a whole. By taking into account the economic relations of rent, profit and wages, the definite relations of exploitation of the various classes were introduced, since the manner of exploitation depends on the social position of the exploiter. Up to this point the theory of utility was able to base itself on definite social facts; its further account of the manner of exploitation amounts to a mere recital of catechism phrases.

The economic content gradually turned the utility theory into a mere apologia for the existing state of affairs, an attempt to prove that under existing conditions the mutual relations of people today are the most advantageous and generally useful. It has this character among all modern economists.

But whereas the utility theory had thus at least the advantage of indicating the connection of all existing relations with the economic foundations of society, in Sancho the theory has lost all positive content; it is divorced from all actual relations and is restricted to the mere illusion cherished by the isolated bourgeois about his "cleverness", by means of which he reckons to exploit the world. Incidentally, it is only in a few passages that Sancho deals with the theory of utility even in this diluted form; almost the entire "book" is taken up, as we have seen, with egoism in agreement with itself, i.e., with an illusion about this illusion of the petty bourgeois. Even these few passages are finally reduced by Sancho to mere vapour, as we shall see.

D. Religion

"In this community" (namely with other people) "I perceive nothing at all but a multiplication of my power, and I retain it only for so long as it is my multiplied power" (p. 416).

"I no longer abase myself before any power, and recognise that all powers are only my power, which I have immediately to subdue if they threaten to become

a power against me or over me; each of them *is permitted* to be only one of *my means* for achieving my purpose.”

I *“perceive*”, I *“recognise*”, I “*have to* subdue”, power “ *is permitted* to be only one of my means”. We have already been shown in connection with the “union” what these moral demands mean and how far they correspond to reality. This illusion about his power is closely connected with the other illusion: that in the union “substance” is abolished (see “Humane Liberalism”), and that the relations of the union members never assume a rigid form in respect to separate individuals.

“The union, the association, this eternally fluid association of everything that exists.... Of course, society can arise also from union, but only as a fixed idea arises out of a thought.... If a union has crystallised into a society, it has ceased to be an association, for association is the unceasing process of associating with one another; it has reached the state of being associated, it has become society, the corpse of the union or association.... Neither a natural nor a spiritual bond holds the union together” (pp. 294, 408, 416).

As regards the “natural bond”, it exists, despite Sancho’s “ill will”, in the form of corvée peasant economy and organisation of labour, etc., in the union; likewise the “spiritual bond” in Sancho’s philosophy. For the rest we need only refer to what we have already said several times, and repeated in connection with the union, about division of labour causing the relations to confront individuals as something existing independently of them.

“In short, society is holy, the union is your own; society uses you, you use the union”, etc. [p. 418].

E. Supplement to the Union Whereas hitherto we were shown no other possibility of reaching the “union” than through rebellion, now we learn from the “Commentary” that the “union of egoists” already exists in “hundreds of thousands” of cases as one of the aspects of existing bourgeois society and that it is accessible to us even without any rebellion and any “Stirner”. Then Sancho shows us

“such unions in actual life. Faust is within such unions when he exclaims: Here I am a human being” (!), “here I dare to be one [Goethe, Faust, I. Teil, “Osterspaziergang"] here Goethe states it even in black and white” (“but the holy person is called Humanus, see Goethe”, [Humanus — a character in Goethe’s unfinished poem “Die Geheimnisse"] cf. “the book”)....... If Hess were to look attentively at real life, he would see hundreds of thousands of such egoistical unions — some of short duration, some enduring.”

Sancho then makes some “children” meet for a game in front of Hess’ window, and makes “a few friends” take Hess to a tavern and lets him associate with his “beloved”.

“Of course, Hess does not notice how full of significance these trivial examples are and how infinitely different they are from the holy societies and indeed from the fraternal, human society of holy socialists” (Sancho contra Hess, Wigand, pp. 193, 194).

In just the same way, on page 305 of “the book”, “association for interests” is graciously accepted as a voluntary material aims and union of egoists.

Thus the union here is reduced, on the one hand, to bourgeois associations and joint-stock companies and, on the other hand, to bourgeois clubs, picnics, etc. That the former belong wholly to the pre*sent epoch* is well known, and that this equally applies to the latter is a so well known. Let Sancho look at the “unions” of an earlier epoch, e.g., of feudal times, or those of other nations, e.g., of the Italians, English, etc., right down to the “unions” of children, in order to realise what the difference is. By this new interpretation of the union he confirms only his obdurate conservatism. Sancho, who incorporated the whole of bourgeois society, insofar as he liked it, into his allegedly new institution, here by way of supplement only assures us that in his union people will also enjoy themselves and indeed in quite the traditional way. Our bonhomme, of course, does not consider the question: what relations existing independently of him enable — or do not enable — him to “accompany a few friends to a tavern”.

The idea of resolving the whole of society into voluntary groups — which is here, on the basis of hearsay accounts current in Berlin, turned into a Stirnerian idea — belongs to Fourier. [Charles Fourier, Théorie de l'unité universelle] But with Fourier this view presupposes a complete transformation of society and is based on a criticism of the existing “unions”, so much admired by Sancho, and of their infinite tedium. Fourier describes these present-day attempts at amusement in their connection with the existing relations of production and intercourse, and wages a polemic against them; Sancho, far from criticising them, wants on the contrary to transplant them in their entirety into his new “mutual agreement” institution for promoting happiness; he thereby only proves once again how strongly he is held in thrall to existing bourgeois society.

Finally, Sancho delivers the following *oratio pro domo,* i.e., in defence of the “union”.

“Is a union in which the majority allow themselves to be cheated in regard to their most natural and obvious interests, a union of egoists? Have egoists united where one is the slave or serf of another?... Societies in which the needs of some are satisfied at the expense of others, in which, for example, some can satisfy the

need for rest by others having to work to the point of exhaustion ... Hess ... identifies ... these 'egoistical unions' of his with Stirner's union of egoists" ([Wigand,] pp. 192, 193).

Sancho, therefore, expresses the pious wish that in his union, based on mutual exploitation, all the members will be equally powerful, cunning, etc., etc., so that each can exploit the others to exactly the same extent as they exploit him, and so that no one will be "cheated" in regard to his "most natural and obvious interests" or be able to "satisfy his needs at the expense of others". We note here that Sancho recognises "natural and obvious interests" and "needs" of all — consequently, *equal* interests and needs. Further, we recall at once page 456 of the book, according to which "overreaching" is a "moral idea inculcated by the guild spirit", and for a man who has had a "wise education", it remains a "fixed idea from which no freedom of thought can give protection". Sancho "gets his thoughts from above and adheres to them" (ibid.). This equal power of all consists, according to his demand, in that everyone should become "*omnipotent*", i.e., all should become *impotent* in relation to one another, a perfectly consistent postulate that coincides with the sentimental desire of the petty bourgeois for a world of hucksters, in which everyone gets his advantage. Or, on the other hand, our saint quite suddenly presupposes a society in which each can satisfy his needs unhampered, without doing so "at the expense of others", and in that case the theory of exploitation again becomes a meaningless paraphrase for the actual relations of individuals to one another.

After Sancho in his "union" has "devoured" and consumed the others, thereby transforming intercourse with the world into intercourse with himself, he passes from this indirect self-enjoyment to direct self-enjoyment, by consuming himself.

C. My Self-Enjoyment

The *philosophy* which preaches enjoyment is as old in Europe as the Cyrenaic school. [74] just as in antiquity it was the Greeks who were the protagonists of this philosophy, so in modern times it is the French, and indeed for the same reason, because their temperament and their society made them most capable of enjoyment. The philosophy of enjoyment was never anything but the clever language of certain social circles who had the privilege of enjoyment. Apart from the fact that the manner and content of their enjoyment was always determined by the whole structure of the rest of society and suffered from all its contradictions, this philosophy became a mere phrase as soon as it began to lay claim to a universal character and proclaimed itself the outlook on life of society as a whole. It sank then to the level of edifying moralising, to a sophistical palliation of existing society, or it was transformed into its opposite, by declaring compulsory asceticism to be enjoyment.

In modern times the philosophy of enjoyment arose with the decline of feudalism and with the transformation of the feudal landed nobility into the pleasure-loving and extravagant nobles of the court under the absolute monarchy. Among these nobles this philosophy still has largely the form of a direct, naive outlook on life which finds expression in memoirs, poems, novels, etc. It only becomes a real philosophy in the hands of a few writers of the revolutionary bourgeoisie, who, on the one hand, participated in the culture and mode of life of the court nobility and, on the other hand, shared the more general outlook of the bourgeoisie, based on the more general conditions of existence of this class. This philosophy was, therefore, accepted by both classes, although from totally different points of view. Whereas among the nobility this language was restricted exclusively to its estate and to the conditions of life of this estate, it was given a generalised character by the bourgeoisie and addressed to every individual without distinction. The conditions of life of these individuals were thus disregarded and the theory of enjoyment thereby transformed into an insipid and hypocritical moral doctrine. When, in the course of further development, the nobility was overthrown and the bourgeoisie brought into conflict with its opposite, the proletariat, the nobility became devoutly religious, and the bourgeoisie solemnly moral and strict in its theories, or else succumbed to the above-mentioned hypocrisy, although the nobility in practice by no means renounced enjoyment, while among the bourgeoisie enjoyment even assumed an official, economic form — that of *luxury*.

[The following passage is crossed out in the manuscript:] In the Middle Ages the pleasures were strictly classified; each estate had its own distinct forms of pleasure and its distinct manner of enjoyment. The nobility was the estate privileged to devote itself exclusively to pleasure, while the separation of work and enjoyment already existed for the bourgeoisie and pleasure was subordinated to work. The serfs, the class destined exclusively to labour, had only extremely few and restricted. pleasures, which came their way mostly by chance, depended on the whim of their masters and other contingencies, and are hardly worth considering.

Under the rule of the bourgeoisie the nature of the pleasures depended on the classes of society. The pleasures of the bourgeoisie are determined by the material brought forth by this class at various stages of its development and they have acquired the tedious character which they still retain from the individuals and from the continuous subordination of pleasure to money-making. The present crude form of proletarian pleasure is due, on the one hand, to the long working hours, which led to the utmost intensification of the need for

enjoyment, and, on the other hand, to the restriction -both qualitative and quantitative – of the means of pleasure accessible to the proletarian.

In general, the pleasures of all hitherto existing estates and classes had to be either childish, exhausting or crude, because they were always completely divorced from the vital activity, the real content of the life of the individuals. and more or less reduced to imparting an illusory content to a meaningless activity. The hitherto existing forms of enjoyment could, of course, only be criticised when the contradiction between the bourgeoisie and the proletariat had developed to such an extent that the existing mode of production and intercourse could be criticised as well.

It was only possible to discover the connection between the kinds of enjoyment open to individuals at any particular time and the class relations in which they live, and the conditions of production and intercourse which give rise to these relations, the narrowness of the hitherto existing forms of enjoyment, which were outside the actual content of the life of people and in contradiction to it, the connection between every philosophy of enjoyment and the enjoyment actually present and the hypocrisy of such a philosophy which treated all individuals without distinction — it was, of course, only possible to discover all this when it became possible to criticise the conditions of production and intercourse in the hitherto existing world, i.e., when the contradiction between t — he bourgeoisie and the proletariat had given rise to communist and socialist views. That shattered the basis of all morality, whether the morality of asceticism or of enjoyment.

Our insipid, moralising Sancho believes, of course, as his whole book shows, that it is merely a matter of a different morality, of what appears to him a new outlook on life, of "getting out of one's head" a few "fixed ideas", to make everyone happy and able to enjoy life. Hence the chapter on self-enjoyment could at most reproduce under a new label the same phrases and maxims which he had already so frequently had the "self-enjoyment" of preaching to us. This chapter has only one original feature, namely that he *deifies* and turns into philosophical German all enjoyment, by giving it the name "self-enjoyment". While the French philosophy of enjoyment of the eighteenth century at least gave a witty description of the gay and audacious mode of life that then existed, Sancho's whole frivolity is limited to such expressions as "consuming" and "squandering", to images such as the "light" (it should read a candle) and to natural-scientific recollections which amount either to belletristic nonsense such as that the plant "imbibes the air of the ether" and that "song-birds swallow beetles", or else to wrong statements, for example, that a candle burns itself. On the other hand, here we again enjoy all the solemn seriousness of the statements against "the holy", which, we are told, in the guise of "vocation — designation — task" and "ideal" has hitherto spoiled people's self-enjoyment.

For the rest, without dwelling on the more or less dirty forms in which the "self" in "self-enjoyment" can be more than a mere phrase, we must once more as briefly as possible outline for the reader Sancho's machinations against the holy, with the insignificant modulations occurring in this chapter.

— Revolutionary Tasks —

To recapitulate briefly, "vocation, designation, task, ideal" are either

1) the idea of the revolutionary tasks laid down for an oppressed class by the material conditions; or

2) mere idealistic paraphrases, or also the apt conscious expression of the individuals' modes of activity which owing to division of labour have assumed independent existence as various professions; or

3) the conscious expression of the necessity which at every moment confronts individuals, classes and nations to assert their position through some quite definite activity; or

4) the conditions of existence of the ruling class (as determined by the preceding development of production), ideally expressed in law, morality, etc., to which [conditions] the ideologists of that class more or less consciously give a sort of theoretical independence; they can be conceived by separate individuals of that class as vocation, etc., and are held up as a standard of life to the individuals of the oppressed class, partly as an embellishment or recognition of domination, partly as a moral means for this domination. It is to be noted here, as in general with ideologists, that they inevitably put the thing upside-down and regard their ideology both as the creative force and as the aim of all social relations, whereas it is only an expression and symptom of these relations.

As for our Sancho, we know that he has the most ineradicable faith in the illusions of these ideologists. Because people, depending on their various conditions of life, construct various notions about themselves, that is about man, Sancho imagines that the various ideas created the various conditions of life and thus the wholesale manufacturers of these ideas, i.e., the ideologists, have dominated the world. Cf. page 433.

"Thinkers rule in the world", "thought rules the world"; priests or school-masters" "stuff their heads with all sorts of trash", "they imagine a human ideal" which other people have to take as a guide (p. 442).

Sancho even knows exactly the conclusion by virtue of which people were subjected to the fancies of the school-masters and owing to their stupidity subjected themselves to these fancies:

“Because it is conceivable for me” (the school-master), “it is possible for people; because it is possible for people, it means that they ought to be such, it was their vocation; and, finally, it is only according to this vocation, only as persons having a vocation, that one must judge human beings. And the further conclusion? It is not the individual who is man, but it is a thought, an ideal, that is man (p. 441). — species — mankind”

All collisions in which, owing to their actual conditions of life, human beings become involved with themselves or with others appear to our school-master Sancho as collisions between people and their ideas about the life of “Man”, ideas which they either have put themselves into their heads or have allowed school-masters to put into their heads. If they managed to get these ideas out of their heads “how happily” “these unfortunate beings could live”, what “capers” they could cut, whereas now they have to “dance to the pipe of the school-masters and bear-leaders"! (p. 435). (The lowest of these “bear-leaders” is Sancho, for it is only himself whom he leads by the nose.) If, for example, people almost always and almost everywhere — in China as well as in France — did not get it into their heads that they suffer from over-population, what an overflowing abundance of the means of existence would these “unfortunate beings” suddenly have at their disposal.

Under the pretext of writing a treatise on possibility and reality, Sancho here once more attempts to put forward his old story of the rule of the holy in the world. For him everything a school-master gets into his head about me is possible, and then Sancho can easily prove that this possibility has no reality except in his head. His solemn assertion that “behind the word possible lay concealed the most momentous misunderstanding of thousands of years” (p. 441) is sufficient proof that it is impossible for him to conceal behind word s the consequences of his abundant misunderstanding of thousands of years.

This treatise on the “coincidence of possibility and reality” (p. 439), on what people have the ability to be and what they are, a treatise that harmonises so well with his earlier insistent exhortations that one should bring all one’s abilities into play, etc., leads him, however, to a few more digressions on the materialist *theory of circumstances,* which we shall presently deal with in more detail. But first, one more example of his ideological distortion. On page 428 he makes the question “how can one acquire life” identical with the question how is one to “create in oneself the true ego” (or “life”). According to the same page, “worrying about life” ceases with his new moral philosophy and the “squandering” of life begins. Our Solomon expresses still more “eloquently” the miraculous power of his allegedly new moral philosophy in the following saying:

“Regard yourself as more powerful than others say You are, then you will have more power: value yourself more and you will have more” (p. 483).

See above, in the section on the "union", Sancho's method of acquiring property. Now for his *theory of circumstances.*

"Man has no vocation. but he has powers which manifest themselves where they exist, because their being consists solely in their manifestation, and they cannot remain inactive any more than life itself.... Everyone at each instant uses as much power as he has" ("increase your value, follow the example of the courageous man, let each of you become an omnipotent ego", etc. — Sancho said above). ... One's powers can indeed be intensified and multiplied, particularly by hostile resistance or friendly support; but where their application is missing one can be sure that they are absent. It is possible to strike fire from a stone, but without striking it, nothing comes out; similarly man needs an impulse. Since powers always prove to be operative of themselves, the injunction to use them would be superfluous and senseless.... Power is merely a simpler word for manifestation of power" (pp. 436, 437).

"Egoism in agreement with itself", which just as it pleases brings or does not bring its powers or abilities into play and which applies the *jus utendi et abutendi* to them, here suddenly and unexpectedly comes to grief. Once they are present, the forces here all of a sudden act autonomously, without caring about Sancho's "pleasure", they act like chemical or mechanical forces, independently of the individual who possesses them. We learn further that a force is not present if its manifestation is missing; the correction being made that power requires an impulse for its manifestation. We do not learn, however, how Sancho will decide whether it is the impulse or the power that is lacking when the manifestation of power is deficient. On the other hand, our unique investigator of nature teaches us that "it is possible to strike fire from a stone", and, as is always the case with Sancho, he could not have chosen a more unfortunate example. Sancho, like a simple village school-master, believes that the fire he strikes in this way comes from the stone, where it was previously latent. But any fourth-form schoolboy could tell him that in this method of obtaining fire, a method long forgotten in all civilised countries, by the friction of steel and stone, particles which become red-hot owing to this friction are separated from the steel, and not from the stone; that, consequently, the "fire", which for Sancho is not a definite relation, at a definite temperature, of certain bodies to certain other bodies, in particular oxygen, but is an independent thing, an "element", a fixed idea, "the holy" — that this fire does not come either from the stone or from the steel. Sancho might just as well have said: one can make bleached linen from chlorine, but if the "impulse", viz., the *unbleached* linen, is lacking, then "nothing comes out". We shall take this opportunity, for Sancho's "self-enjoyment", of noting an earlier fact of "unique" natural science. In the ode on crime it is stated:

"Is there not a distant peal of thunder

And do you not see how the sky

Filled with foreboding is silent and overcast?" (p. 319 of "the book"),

It thunders and the sky is silent. Hence Sancho knows of some other place than the sky from which thunder comes. Further, Sancho notices the silence of the sky by means of his organ of *sight*— a feat which no one will be able to imitate. Or perhaps Sancho hears thunder and *sees* silence, so that the two phenomena can take place simultaneously. We saw how Sancho in dealing with "apparitions" made mountains represent the "spirit of loftiness" . Here the silent sky represents for him the spirit of foreboding.

Incidentally, it is not clear why Sancho here rails against the "injunction to us c one's powers". This injunction, after all, could possibly be the missing "impulse", which, it is true, fails to have effect in the case of a stone, but the efficacy of which Sancho could observe during the exercises of any battalion. That the "injunction" is an "impulse" even for his feeble powers follows also from the fact that for him it turns out to be a "stumbling block". [*anstoss* — impulse, shock, scandal, offence; *Stein des Anstosses* — stumbling block]

Consciousness is also a power which, according to the doctrine which has just been enunciated, "always proves to be operative of itself". In accordance with this, therefore, Sancho ought not to have set out to change consciousness, but at most the "impulse" which affects consciousness; consequently Sancho would have written his whole book in vain. But in this case, of course, he regards his moral preaching and "injunctions" as a sufficient "impulse".

"What an individual can become he will become. A born poet may be prevented, owing to unfavourable circumstances, from being abreast of the times and creating great works of art, for which much study is indispensable; but he will compose poetry whether he is an agricultural labourer or has the good fortune to live at the Weimar Court. A born musician will occupy himself with music, no matter whether on all instruments" (he found this fantasy about "all instruments" in Proudhon. See "Communism") "or only on a shepherd's reed" (Virgil's Eclogues, of course, again come into the mind of our school-master). "A born philosophical intellect can prove its worth either as a university philosopher or a village philosopher. Finally, a born dunce always remains a blockhead. Indeed, innate limited intellects undoubtedly form the most numerous class of mankind. And why should not the same differences occur in the human species as are unmistakably seen in every species of animate" (p. 434).

Sancho has again chosen his example with his usual lack of skill. If all his nonsense about born poets, musicians and philosophers is accepted, then this example only proves, on the one hand, that a born poet, etc., remains what he is from birth — namely a poet, etc.; and, on the other hand, that the born poet, etc., in so far as he becomes, develops, may, ,owing to unfavourable circumstances", not become what *he could become.* His example, therefore, on the one hand, proves nothing at all, and, on the other hand, proves the opposite of what it was intended to prove; and taking both aspects together it proves that either from birth or owing to circumstances, Sancho belongs to "*the most numerous class of mankind*". However, he shares the consolation of being a unique "blockhead" with this class and with his own blockheadedness.

Here Sancho experiences the adventure with the magic potion which Don Quixote brewed from rosemary, wine, olive oil and salt. As Cervantes relates in the seventeenth chapter, after Sancho had drunk this mixture he spent two hours in sweats and convulsions pouring it out from both channels of his body. The materialist potion which our valiant armour-bearer imbibed' for his self-enjoyment purges him of all his egoism in the extraordinary sense. We saw above that Sancho suddenly lost all his solemnity when confronted with the "impulse", and renounced his "ability", like of yore the Egyptian magicians when confronted with the lice of Moses. Now we observe two new attacks of faint-heartedness, in which he also gives way "to unfavourable *circumstances*" and finally even admits that his original physical organisation is something that becomes crippled without co-operation from him. What is left now to our bankrupt egoist? He has no power over his original physical organisation; nor can he control the "circumstances" and the "impulse" under the influence of which this organisation develops; "what he is at every instant" is not "his own creation", but something created by the interaction between his innate potentialities and the circumstances acting on them — all this Sancho concedes. Unfortunate "creator"! Most unfortunate "creation"!

But the greatest calamity comes at the end. Sancho, not satisfied that already long ago he received the full count of the *tres mil azotes y trecientos en ambas sus valientes posaderas* [three thousand acid three burial lashes upon his ample buttocks] finally delivers himself another and mighty blow by proclaiming himself a *believer in species.* And what a believer in species! Firstly, he attributes division of labour to species by making it responsible for the fact that some people are poets, others musicians, and still others school-masters. Secondly, he ascribes to species the existing physical and intellectual defects of "the most numerous class of mankind" and makes it responsible for the fact that under the rule of the bourgeoisie the majority of individuals are like himself. According to his views on innate limited intellects, one would have to explain the present spread of scrofula from the fact that "the species" finds a special satisfaction in making innate scrofulous constitutions form "the most numerous class of mankind". Even the most ordinary materialists and medical men had got beyond such naive views long before the egoist in agreement with himself was "called" upon by "the species", "unfavourable circumstances" and the "impulse" to make his *début* before the German public. just as previously Sancho explained all crippling of individuals, and hence of their relations, by means of the fixed ideas of school-masters, without worrying about the origin of these ideas, so now he explains this crippling as merely due to the natural process of generation. He has not the slightest idea that the ability of children to develop depends on the development of their parents and that all this crippling under existing social relations has arisen historically, and in the same way can be abolished again in the course of historical development. Even naturally evolved differences within the species, such as racial differences, etc., which Sancho does not mention at all, can and must be abolished in the course of historical development. Sancho — who in this connection casts a stealthy glance at zoology and so makes the discovery that "innate limited intellects" form the most numerous class not only among sheep and oxen, but also among polyps and infusoria, which have no heads at all — has perhaps heard that it is possible to improve races of animals and by cross-breeding to create entirely new, more perfect varieties both for human enjoyment and for their own self-enjoyment.. "Why should not" Sancho be able to draw a conclusion from this in relation to people as well?

We shall take this opportunity to "introduce episodically" Sancho's "transformations" in relation to species. We shall see that his attitude to species is exactly the same as to the holy: the more he blusters against it, the more he believes in it.

No. I. We have already seen that species engenders division of labour and the crippling that takes place under existing social circumstances and *indeed in such a way* that the species together with its products is regarded as something immutable under all circumstances, as outside the control of people.

No. II. "Species is already realised owing to inherent constitution; on the other hand, what you make of this constitution" (according to what was said above, this ought to be: what "circumstances" make of it) "is the realisation of you. Your hand is fully realised in the sense of species, otherwise it would not be a hand but, let us sav, a paw.... You make of it what and how you wish it to be and what you can make of it" (Wigand, pp. 184, 185).

Here Sancho repeats in a different form what was already said in No. I.

We have seen, therefore, from what has been said so far that species, independently of control by individuals and the stage of their historical development, brings into the world all physical and spiritual potentialities, the immediate existence of individuals and, in embryo, division of labour.

No. III. Species remains as "impulse", which is only a general term for the "circumstances" that determine the development of the original individual, again engendered by species. For Sancho species is here precisely the same mysterious force which other bourgeois call the nature of things and which they make responsible for all relationships that are independent of them as bourgeois, and whose interconnection, therefore, they do not understand.

No. IV. Species taken as "what is possible for man" and "required by man" forms the basis of the organisation of labour in "Stirner's union", where likewise what is possible for all and required by all is regarded as a product of species.

No. V. We have already heard about the role that agreement plays in the union.

Page 462: "If it is a matter of coming to an agreement or communicating with one another, then, of course, I can only make use of the human means that are at my disposal because I am at the same time a man" (i.e., a specimen of the species).

Here, therefore, *language* is regarded as a product of the species. That Sancho speaks German and not French, however, is something he in no way owes to the species, but to circumstances. Incidentally, in every modern developed language, partly as a result of the historical development of the language from pre-existing material, as in the Romance and Germanic languages, partly owing to the crossing and mixing of nations, as in the English language, and partly as a result of the concentration of the dialects within a single nation brought about by economic and political concentration, the spontaneously evolved speech has been turned into a national language. As a matter of course, the individuals at some time will take completely under their control this product of the species as well. In the union, language as such will be spoken, holy language, the language of the holy — Hebrew, and indeed the Aramaic dialect spoken by that "corporeal essence", Christ. This "occurred" to us here "against the expectation" of Sancho, and "indeed exclusively because it seems to us that it could help to clarify the remainder".

No. VI. On pages 277, 278, we learn that "the species reveals itself in nations, towns, estates, diverse corporations" and, finally, "in the family"; hence it is perfectly logical that up to now it has "made history". Thus, here all preceding history, up to the unfortunate history of the unique, becomes a product of the "species" and, indeed, for the sufficient reason that this history has sometimes been summed up under the title of the history of *mankind*, i. e., of the species.

No. VII. In what has been said so far Sancho has attributed to the *species* more than any mortal had ever done before him, and he now sums it up in the following proposition:

“Species is nothing ... species is only a conception” (spirit, spectre, etc.) (p. 239).

Ultimately, then, this “*nothing*” of Sancho’s, which is identical with a “*conception*”, means nothing, for Sancho himself is ‘,the creative nothing”, and the species, as we have seen, creates a great deal, and in doing so it can therefore very well be “nothing”. Moreover Sancho tells us on page 456:

“Being justifies nothing at all; something imagined exists just as well as something not imagined.”

Starting with page 448, Sancho spins out a yarn lasting thirty pages in order to strike “fire” out of thought and criticism of the egoist in agreement with himself. We have already experienced too many expressions of his thought and criticism to give the reader further “offence ,a with Sancho’s beggar’s broth. One spoonful of it will suffice.

“Do you believe that thoughts fly about freely for the taking, so that anyone can capture some of them and then put them forward against me as his inviolable property? Everything that flies about, all of it is — mine” (p. 457).

Here Sancho poaches snipe existing only in the mind. We have seen how many of the thoughts flying about he has captured for himself. He fancied that he could catch them as soon as he put the salt of the holy on their tails. This colossal contradiction between his actual property in regard to thoughts and his illusions on that score may serve as a classic and striking example of his entire property in the extraordinary sense. It is precisely this contrast that constitutes his self-enjoyment.

6. Solomon’s Song of Songs or The Unique

Cease man of Troy, and cease thou sage of Greece,

To boast of Navigations great ye made;

Let the high Fame of Alexander cease,

And Trajan’s Banners in the East display'd:

Cease All, whose Actions ancient Bards exprest:

A brighter Valour arises in the West.

And you (my Spree Nymphs)...

[Marx and Engels substituted “Spree” — the river on which Berlin stands — for Tagus]

Give me a mighty Fury, Nor rude Reeds

Or rustic Bag-Pipes sound, But such as War's

Lowd Instrument (the noble Trumpet) breeds,

Which fires the Breast, and stirs the blood to jars.

[This and the following quotations are from Luis de Camões, Lusiada]

give me, o nymphs of the Spree, a song worthy of the heroes who fight on your banks against Substance and Man, a song that will spread over the whole world and will be sung in all lands — for it is a matter here of the man whose deeds are

Beyond what strength of human nature here,

greater than mere "human" power can perform, the man who

... acquir'd

A modern Scepter which to Heaven aspired

who has founded a new kingdom among a far-off people, viz., the "union" — it is a matter here of being a

... fair and tender Blossom of that Tree

Belov'd by Him, who dy'd on one for Man

of the tender and young blossoming shoot of a tree especially loved by Christ, a tree which is nothing less than

. ... certain Hope t'extend the Pale,

One day, of narrow Christianitie.

the surest hope of growth for faint-hearted Christianity — in a word, it is a matter of something "unprecedented", the "unique".

Everything that is to be found in this unprecedented song of songs about the unique was in existence earlier in the "book". We mention this chapter only for the sake of good order; so that we should be able to do it properly we have left the examination of some points until now and we shall briefly recapitulate others.

Conclusion to "The Unique"

Sancho's "ego" has gone through the full gamut of soul migration. We already met it as the egoist in agreement with himself, as corvée peasant, as trader in thoughts, as unfortunate competitor, as owner, as a slave who has had one of his legs torn out, as Sancho tossed into the air by the interaction between birth and circumstances, and in a hundred other shapes. Here it bids us farewell as an "inhuman being", under the same banner as that under which it made its entry into the New Testament.

"Only the inhuman being is the real man" (p. 232).

This is one of the thousand and one equations in which Sancho expounds his legend of the holy.

The concept "man" is not the real man.

The concept "man" = Man.

Man = not the real man.

The real man = the non-man,

= the inhuman being.

"Only the inhuman being is the real man. "

Sancho tries to explain to himself the harmlessness of this proposition by means of the following transformations:

"It is not so difficult to express in a few plain words what an inhuman being is; it is a man [I who does not correspond to the concept of what is human. Logic calls this a nonsensical judgment. Would one have the right to pronounce this judgment that someone can be a man without being a man, if one did not admit the validity of the hypothesis that the concept of man can be separated from his existence, that the essence can be separated from the appearance? People say: so and so seems to be a man, but he is not a man. People have pronounced this nonsensical judgment throughout many centuries: moreover, during this long period of time there have only been inhuman beings. What individual did ever correspond to his concept?" (p. 232).

This passage is again based on our school-master's fantasy about the school-master who has created for himself an ideal of "Man" and "put it into the heads" of other people, a fantasy which forms the basic theme of "the book".

Sancho calls it a hypothesis that the concept and existence, the essence and appearance of "man" can be separated, as though the possibility of this separation is not already expressed in the very words he uses. When he says *concept*, he is speaking of something different from *existence*; when he says *essence,* he is speaking of something different from *appearance*. it is not these *statements* that he brings into contradiction, but they themselves are the expressions of a contradiction. Hence the only question that could have been raised is whether it is permissible for him to range something under these points of view; and in order to deal with this Sancho would have had to consider the actual relations of people who have been given other names in these metaphysical relations. For the rest, Sancho's own arguments about the egoist in agreement with himself and about rebellion show how these points of view can be made to diverge, while his arguments about peculiarity, possibility and reality — in connection with "self-enjoyment" — show how they can be made simultaneously to coincide and to diverge.

The nonsensical judgment of the philosophers that the real man is not man is in the sphere of abstraction merely the most universal, all-embracing expression of the actually existing universal contradiction between the conditions and needs of people. The nonsensical form of the abstract proposition fully corresponds to the nonsensical character, carried to extreme lengths, of the relations of bourgeois society, just as Sancho's nonsensical judgment about his environment — they are egoists and at the same time they are not egoists — corresponds to the actual contradiction between the existence of the German petty bourgeois and the tasks which existing relations have imposed on them and which they themselves entertain in the form of pious wishes and desires. Incidentally, philosophers have declared people to be inhuman, not because they did not correspond to the concept of man, but because their concept of man did not correspond to the true concept of man, or because they had no true understanding of man. *Tout comme chez nous*, [modified phrase from Nolant de Fatouville's comedy Harlequin, empereur dans la lune — "tout comme ici" (just as here) is the stock response made by the people listening to Harlequin's inventions about life on the moon] in "the book", where Sancho also declares that people are non-egoists for the sole reason that they have no true understanding of egoism.

In view of its extreme triviality and indisputable certainty, there should have been no need to mention the perfectly inoffensive proposition that the *idea* of man is not the *real* man, that the idea of a thing is not the thing itself — a proposition which is also applicable to a stone and to the idea of a stone, in accordance with which Sancho should have said that the real stone is non-stone. But Sancho's well-known fantasy that only because of the domination of ideas and concepts mankind has up to now been subjected to all sorts of misfortunes, makes it possible for him to link his old conclusions again with this proposition. Sancho's old opinion that one has only to get a few ideas out of one's *head* in order to abolish from the *world* the conditions which have given rise to these ideas, is reproduced here in the form that one has only to get out of one's *head* the idea of man in order to put an end to the actually existing conditions which are today called *inhuman* — whether this predicate "inhuman" expresses the opinion of the individual in contradiction with his conditions or the opinion of the normal, ruling society about the abnormal, subjected class. In just the same way, a whale taken from the ocean and put in the Kupfergraben,[75] if it possessed consciousness, would declare this situation created by "unfavourable circumstances" to be unwhale-like, although Sancho could prove that it is whale-like, if only because it is its, the whale's, own situation — that is precisely how people argue in certain circumstances.

— The Idea and the Realisation of Freedom —

On page 185, Sancho raises the important question:

"But how to curb the inhuman being who dwells in each individuals How can one manage not to set free the inhuman being along with the human being'? All liberalism has a mortal enemy, an invincible opponent, as God has the devil; at the side of the human being there is always the inhuman being, the egoist, the individual. State, society, mankind cannot master this devil."

"And when the thousand years are expired, Satan shall be loosed out of his prison,

"And shall go out to deceive the nations which are in the four quarters of the earth, Gog and Magog, to gather them together to battle....

"And they went up on the breadth of the earth, and compassed the camp of the saints about, and the beloved city" (Revelation of St. John 20:7-9).

In the form in which Sancho understands it, the question again becomes sheer nonsense. He imagines that people up to now have always formed a concept of man, and then won freedom for themselves to the extent that was necessary to realise this concept; that the measure of freedom that they achieved was determined each time by their idea of the ideal of man at the time; it was thus unavoidable that in each individual there remained a residue which did not correspond to this ideal and, hence, since it was "inhuman", was either not set free or only freed *malgré eux*.

In reality, of course, what happened was that people won freedom for themselves each time to the extent that was dictated and permitted not by their ideal of man, but by the existing productive forces. All emancipation carried through hitherto has been based, however, on restricted productive forces. The production which these productive forces could provide was insufficient for the whole of society and made development possible only if some persons satisfied their needs at the expense of others, and therefore some — the minority — obtained the monopoly of development, while others — the majority — owing to the constant struggle to satisfy their most essential needs, were for the time being (i.e., until the creation of new revolutionary productive forces) excluded from any development. Thus, society has hitherto always developed within the framework of a contradiction — in antiquity the contradiction between free men and slaves, in the Middle Ages that between nobility and serfs, in modern times that between the bourgeoisie and the proletariat. This explains, on the one hand, the abnormal, "inhuman" way in which the oppressed class satisfies its needs, and, on the other hand, the narrow limits within which intercourse, and with it the whole ruling class, develops. Hence this restricted character of development consists not only in the exclusion of one class from development, but also in the narrow-mindedness of the excluding class, and the "inhuman" is to be found also within the ruling class. This so-called "inhuman" is just as much a product of present-day relations as the "human" is; it is their negative aspect, the rebellion — which is not based on any new revolutionary productive force — against the prevailing relations brought about by the existing productive forces, and against the way of satisfying needs that corresponds to these relations. The positive expression "human" corresponds to the definite relations *predominant* at a certain stage of production and to the way of satisfying needs determined by them, just as the negative expression "inhuman" corresponds to the attempt to negate these predominant relations and the way of satisfying needs prevailing under them without changing the existing mode of production, an attempt that this stage of production daily engenders afresh.

For our saint, such world-historical struggles are reduced to a mere collision between Saint Bruno and "the mass". Cf. the whole criticism of humane liberalism, especially page 192 et seq.

Thus, our simple-minded Sancho with his naive little statement about the inhuman being and with his talk of getting-man-out-of-one's-head, thanks to which the inhuman being also disappears and there is no longer any measure for individuals, finally arrives at the following result. He regards the physical, intellectual and social crippling and enslavement which as a result of the existing relations afflict an individual, as the individuality and peculiarity of that individual; like an ordinary conservative he calmly recognises these relations once he has freed his mind of all worry by getting out of his head the philosophers' idea of these relations. just as here he declares fortuitous features imposed on the individual to be the latter's individuality, so earlier (cf. "Logic"), in connection with the ego, he abstracted not only from any fortuity, but also in general from any individuality.

About the “inhuman” great result obtained by him Sancho sings in the following *Kyrie eleison*, [Lord have mercy] which he puts into the mouth of “*the inhuman being*":

“I was despicable because I sought my better self outside me;

"I was the inhuman, because I dreamed of the human;

"I was like the pious ones who hunger for their true ego and always remain poor sinners;

"I thought of myself only in comparison with someone else;

"I was not all in all, I was not — unique.

"Now, however, I cease to appear to myself as the inhuman;

"I cease to measure myself by man and to let others measure me;

"I cease to recognise anything above myself —

"I was inhuman, but I am no longer inhuman, I am the unique!” Hallelujah!

We shall not dwell further here on how “the inhuman” — which, it may be said in passing, put itself in the right frame of mind by “*turning its back*” “*on itself* and the critic”, Saint Bruno — how “the inhuman” here “*appears*”, or does not “appear” to *itself*. We shall only point out that the “unique” (it or he) is characterised here by his getting the holy out of his, head for the nine-hundredth time, whereby, as we in our turn are compelled to repeat for the nine-hundredth time, everything remains as before, not to mention the fact that it is no more than a pious wish.

We have here, for the first time, the unique person, Sancho, who with the litany mentioned above has received the accolade of knighthood, now appropriates his new, noble name. Sancho arrives at his uniqueness by getting “Man” out of his head. He thereby ceases “to think of himself only in comparison with someone else” and “to recognise something above him”. He becomes incomparable. This is again the same old fantasy of Sancho’s that it is not the needs of individuals, but concepts, ideas, “the holy” — here in the shape of “Man” — that are the sole *tertium comparationis* and the sole bond between individuals. He gets an *idea* out of his head and thereby becomes unique.

To become “unique” in his sense of the word he must above all prove to us his *freedom from premises.*

Page 470: “Your thought has as its premise not thought, but you. But thus you nevertheless have yourself as a premise? Yes, but not to me, but to my thought. I am before my thought. It follows hence that no thought precedes my thinking, or that my thinking is without any premise. For the premise which I am for my

thinking is not one created by thinking, not one that is thought, but ... is the owner of thinking, and proves only that thinking is nothing but — property."

"We are prepared to allow" that Sancho does not think before he thinks, and that he and everyone else is in this respect a thinker without premises. Similarly we concede that he does not have any thought as the premise of his existence, i.e., that he was not created by thoughts. If for a moment Sancho abstracts from all his thoughts — which with his meagre assortment cannot be very difficult — there remains his real ego, but his real ego within the framework of the actual relations of the world that exist for it. In this way he has divested himself for a moment of all dogmatic premises, but now for the first time the *real* premises begin to come to light for him. And these real premises are also the premises of his *dogmatic* premises which, whether he likes it or not, will reappear to him together with the real ones so long as he does not obtain different real premises, and with them also different dogmatic premises, or so long as he does not recognise in a materialistic way that the real premises are the premises of his thinking, and a„ a result his dogmatic ones will disappear altogether. just as his development up to now and his Berlin environment have at present led to the dogmatic premise of egoism in agreement with itself, so, despite all imaginary freedom from premises, this premise will remain with him as long as he fails to overcome its real premises.

As a true school-master, Sancho still continues to strive for the famous Hegelian "premiseless thinking", i.e., thinking without dogmatic premises, which in Hegel too is only a pious wish. Sancho believed he could achieve this by a skilful leap and even surpass it by going in pursuit of the premiseless ego. But both the one and the other eluded his grasp.

Then Sancho tries his luck in another fashion:

Pages 214, 215: "Make full use" of the demand for freedom! "Who shall become free? You, I, we. Free from what? From everything that is not you, not I, not we, I, therefore, am the core.... What remains if I become free from everything that is not I? Only I and nothing but I."

So that was the poodle's core!

A travelling scholar? The incident makes me laugh.

[Goethe, Faust, I. Teil, 1. "Studierzimmerszene"]

"Everything that is not you, not I, not we" is, of course, here again a dogmatic idea, like state, nationality, division of labour, etc. Once these ideas have been subjected to criticism — and, in Sancho's opinion, this has already been done by "criticism", namely critical criticism — he again imagines that he is also free from the actual state, actual nationality and division of labour. Consequently the ego, which is here the "core", which "has become free from everything that is not I" — is still the above-mentioned premiseless ego with everything that it has not got rid of.

If, however, Sancho were once to tackle the subject of "becoming tree" with the desire of freeing himself not merely from categories, but from actual fetters, then such liberation would presuppose a change common to him and to a large mass of other people, and would produce a change in the state of the world which again would be common to him and others. Although his "ego" "remains" after liberation, it is hereafter a totally changed ego sharing with others a changed state of the world which is precisely the premise, common to him and others, of his and their freedom, and it follows that the uniqueness, incomparability and independence of his "ego" again come to nothing.

Sancho tries again in a third fashion:

Page 237: "Their disgrace is not that they" (Jew and Christian) "*exclude* each other but that this only *half* occurs. If they could be perfect egoists they would totally exclude each other."

Page 273: "If one desires only to resolve the contradiction one grasps its meaning in too formal and feeble a way. The contradiction deserves rather to be sharpened."

Page 274: "Only when you recognise your contradiction fully and when everyone asserts himself from head to foot as unique will you no longer simply conceal your contradiction.... The final and most decisive contradiction — that between one unique person and another — goes basically beyond the bounds of what is called contradiction.... As a unique person you have nothing more in common with the other and, for that reason, nothing that makes you separate from him or hostile to him.... Contradiction disappears in perfect ... separateness or uniqueness."

Page 183: "I do not want to have or to be something special in relation to others; nor do I measure myself by others.... I want to be everything I can be, and to have everything I can have. What do I care whether others are or have something similar to me? They can neither be nor have something equal, the same. I do nothing detrimental to them any more than it is to the detriment of the cliff that I have the advantage of movement. If they could have it, they would have it. Doing nothing to the detriment of other people, that is the meaning of the demand to have no privileges.... One should not regard oneself as 'something special', e.g., Jew or Christian. Well, I regard myself not as

something special but as unique. True, I have a resemblance to others; but this holds only for comparison or reflection; in fact, however, I am incomparable, unique. My flesh is not their flesh, my spirit is not their spirit. If you bring them under the general concept 'flesh', 'spirit', then those are your thoughts, which have nothing to do with ray flesh, my spirit."

Page 234: "Human society perishes because of the egoists, for they no longer treat one another as human beings, but act egoistically as an ego against a you that is totally distinct from and hostile to me."

Page 180: "As though one individual will not always seek out another, and as though one person does not have to adapt himself to another, when he needs him. But the difference is that in this case the individual actually unites with another individual, whereas previously he was linked to him by a bond."

Page 178: "Only when you are unique can you in your intercourse with one another be what you actually are."

As regards Sancho's illusion about the intercourse of the unique ones "as what they actually are", about "the uniting of the individual with the individual", in short, about the "union", that has been completely dealt with. We shall merely point out: whereas in the union each regarded and treated the other merely as *his* object, his property (cf. page 167 and the theory of property and exploitation), in the "Commentary" (*Wigand*, p. 157), on the contrary, the governor of the island of Barataria realises and recognises that the other also belongs to himself, is his own, is unique, and in that capacity also becomes Sancho's *object,* although no longer Sancho's property. In his despair, lie saves himself only by the unexpected idea that "because of this" he "forgets himself in sweet self-oblivion", a delight which he "affords himself a thousand times every hour" and which is still further sweetened by the sweet consciousness that nevertheless he has not "completely disappeared". The result, therefore, is the old wisdom that each exists for himself and for others.

Let us now reduce Sancho's pompous statements to their actual modest content.

The bombastic phrases about "contradiction" which has to be sharpened and taken to extremes, and about the "something special", which Sancho does not want to have as his advantage, amount to one and the same thing. Sancho wants, or rather *believes* he wants, that intercourse between individuals should be purely personal, that their intercourse should not be mediated through some third thing (cf. competition). This third thing here is the "something special", or the special, not absolute, contradiction, i.e., the position of individuals in relation to one another determined by present-day social relations. Sancho does not want, for example, two individuals to be in "contradiction" to one another as bourgeois and proletarian; he protests against the "special" which forms the "advantage" of the bourgeois over the proletarian; he would like to have them enter into a purely personal relation, to associate with one another merely as individuals. He does not take into consideration that in the framework of division of labour personal relations necessarily and inevitably develop into class relations and become fixed as such and that, therefore, all his talk amounts simply to a pious wish, which he expects to realise by exhorting the individuals of these classes to get out of their heads the idea of their "contradiction" and their "special" "privilege". In the passages from Sancho quoted above, everything turns only on people's *opinion of themselves,* and *his* opinion of them, what they want and what *he* wants. "Contradiction" and the "special" are abolished by a change of "*opinion*" and "*wanting*".

— On Individuality —

Even that which constitutes the advantage of an individual as such over other individuals, is in our day at the same time a product of society and in its realisation is bound to assert itself as privilege, as we have already shown Sancho in connection with competition. Further, the individual as such, regarded by himself, is subordinated to division of labour, which makes him one-sided, cripples and determines him.

What, at best, does Sancho's sharpening of contradiction and abolition of the special amount to? To this, that the mutual relations of individuals should be their *behaviour* to one another, while their mutual differences should be their *self-distinctions* (as one empirical self distinguishes *itself* from another). Both of these are either, as with Sancho, an ideological paraphrase of *what exists,* for the relations of individuals under all circumstances *can* only be their mutual behaviour, while their differences can only be their self-distinctions. Or they are the pious wish that they *should* behave in *such a way* and differ from one another *in such a way*, that their behaviour does not acquire independent existence as a social relationship independent of them, and that their differences from one another should not assume the material character (independent of the person) which they have assumed and daily continue to assume.

Individuals have always and in all circumstances "proceeded *from themselves*", but since they were not *unique* in the sense of not needing any connections with one another, and since their *needs*, consequently their nature, and the method of satisfying their needs, connected them with one another (relations between the sexes, exchange, division of labour), they *had to* enter into relations with one another.

Moreover, since they entered into intercourse with one another not as pure egos, but as individuals at a definite stage of development of their productive forces and requirements, and since this intercourse, in its turn, determined production and needs, it was, therefore, precisely the personal, individual behaviour of individuals, their behaviour to one another as individuals, that created the existing relations and daily reproduces them anew. They entered into intercourse with one another as what they were, they proceeded "from themselves", as they were, irrespective of their "outlook on life". This "outlook on life" — even the warped one of the philosophers — could, of course, only be determined by their actual life. Hence it certainly follows that the development of an individual is determined by the development of all the others with whom he is directly or indirectly associated, and that the different generations of individuals entering into relation with one another are connected with one another, that the physical existence of the later generations is determined by that of their predecessors, and that these later generations inherit the productive forces and forms of intercourse accumulated by their predecessors, their own mutual relations being determined thereby. In short, it is clear that development takes place and that the history of a single individual cannot possibly be separated from the history of preceding or contemporary individuals, but is determined by this history.

The transformation of the individual relationship into its opposite, a purely material relationship, the distinction of individuality and fortuity by the individuals themselves, is a historical process, as we have already shown,' and at different stages of development it assumes different, ever sharper and more universal forms. In the present epoch, the domination of material relations over individuals, and the suppression of individuality by fortuitous circumstances, has assumed its sharpest and most universal form, thereby setting existing individuals a very definite task. It has set them the task of replacing the domination of circumstances and of chance over individuals by the domination of individuals over chance and circumstances. It has not, as Sancho imagines, put forward the demand that "I should develop myself", which up to now every individual has done without Sancho's good advice; it has on the contrary called for liberation from a quite definite mode of development. This task, dictated by present-day relations, coincides with the task of organising society in a communist way.

We have already shown above that the abolition of a state of affairs in which relations become independent of individuals, in which individuality is subservient to chance and the personal relations of individuals are subordinated to general class relations, etc. — that the abolition of this state of affairs is determined in the final analysis by the abolition of division of labour. We have also shown that the abolition of division of labour is determined by the development of intercourse and productive forces to such a degree of universality that private property and division of labour become fetters on them. We have further shown that private property can be abolished only on condition of an all-round development of individuals, precisely because the existing form of intercourse and the existing productive forces are all-embracing and only individuals that are developing in an all-round fashion can appropriate them, i.e., can turn them into free manifestations of their lives. We have shown that at the present time individuals *must* abolish private property, because the productive forces and forms of intercourse have developed so far that, under the domination of private property, they have become destructive forces, and because the contradiction between the classes has reached its extreme limit. Finally, we have shown that the abolition of private property and of the division of labour is itself the association of individuals on the basis created by modern productive forces and world intercourse.

Within communist society, the only society in which the genuine and free development of individuals ceases to be a mere phrase, this development is determined precisely by the connection of individuals, a connection which consists partly in the economic prerequisites and partly in the necessary solidarity of the free development of all, and, finally, in the universal character of the activity of individuals on the basis of the existing productive forces. We are, therefore, here concerned with individuals at a definite historical stage of development and by no means merely with individuals chosen at random, even disregarding the indispensable communist revolution, which itself is a general condition for their free development. The individuals' consciousness of their mutual relations will, of course, likewise be completely changed, and, therefore, will no more be the "principle of love" or *dévoûment* than it will be egoism.

Thus, "uniqueness" — taken in the sense of genuine development and individual behaviour, as outlined above — presupposes not only things quite different from good will and right consciousness, but even the direct opposite of Sancho's fantasies. With him "uniqueness" is nothing more than an embellishment of existing conditions, a little drop of comforting balm for the poor, impotent soul that has become wretched through wretchedness.

As regards Sancho's "*incomparability*", the situation is the same as with his "uniqueness". He himself will recall, if he is not completely "lost" in "sweet self-oblivion", that the organisation of labour in "*Stirner's* union of egoists" was based not only on the comparability of needs, but also on their *equality*. And he assumed not only equal needs, but also equal activity, so that one individual could take the place of another in "human work". And the extra remuneration of the "unique" person, crowning his efforts — what other basis had it than the fact that his performance was compared with that of others and in view of its superiority was better paid? And how can Sancho talk at all about incomparability when he allows *money* — the means of comparison that acquires independent existence in practice — to continue in being, subordinates himself to it and allows himself to be measured by this universal scale in order to be compared with others? It is quite evident that he himself gives the lie to his doctrine rid of incomparability. Nothing is easier than to call equality and inequality, similarity and dissimilarity, determinations of reflection. Incomparability too is a determination of reflection which has the activity of comparison as its premise. To show that comparison is not at all a purely arbitrary determination of reflection, it is enough to give just one example, money, the permanent *tertium comparationis* of all people and things.

Incidentally, incomparability can have different meanings. The only meaning in question here, namely "uniqueness" in the sense of originality, presupposes that the activity of the incomparable individual in a definite sphere differs from the activity of his *equals*. Persiani is an incomparable singer precisely because she is a singer and is compared with other singers, and indeed by people who are able to recognise her incomparability through comparison based on normal hearing and musical training. Persiani's singing and the croaking of a frog are incomparable, although even here there could be a comparison, but it would be a comparison between a human being and a frog, and not between Persiani and a particular unique frog. Only in the first case is it possible to speak of a comparison between individuals, in the second it is a matter only of their properties as species or genus. A third type of incomparability — the incomparability of Persiani's singing with the tail of a comet — we leave to Sancho for his "self-enjoyment", since at any rate he finds pleasure in "nonsensical judgments", although even this absurd comparison has a real basis in the absurdity of present-day relations. Money is the common measure for all, even the most heterogeneous things.

Incidentally, Sancho's incomparability amounts to the same empty phrase as his uniqueness. Individuals are no longer to be measured by some *tertium comparationis* independent of them, but comparison *should* be transformed into their self-distinction, i.e., into the free development of their individuality, which, moreover, is brought about by their getting "fixed ideas" out of their heads.

Incidentally, Sancho is acquainted only with the type of comparison made by scribblers and ranters, which leads to the magnificent conclusion that Sancho is not Bruno and Bruno is not Sancho. On the other hand, he is, of course, unacquainted with the sciences which have made considerable advances just by comparing and establishing differences in the spheres of comparison and in which comparison acquires a character of universal importance — i.e., in comparative anatomy, botany, philology, etc.

Great nations — the French, North Americans, English — are constantly comparing themselves with one another both in practice and theory, in competition and in science. Petty shopkeepers and philistines, like the Germans, who are afraid of comparison and competition, hide behind the shield of incomparability supplied them by their manufacturer of philosophical labels. Not only in their interests, but also in his own, has Sancho refused to tolerate any comparison.

On page 415 Sancho says:

"There exists no one equal to me,"

and on page 408 association with "my equals" is depicted as the dissolution of society in intercourse:

"The child prefers intercourse with his equals to society."

However, Sancho sometimes uses "equal to me" and "equal" in general in the sense of "*the same*", e.g., the passage on page 183 quoted above:

"They can neither be nor have something equal, the same."

Here he arrives at his final "new turn of expression", which he uses especially in the "Commentary".

The uniqueness, the originality, the "peculiar" development of individuals which, according to Sancho, does not for example occur in all "human works", although no one will deny that one stove-setter does not set a stove in the "*same*" way as another; the unique" development of individuals which, in the opinion of this same Sancho, does not occur in religious, political, etc., spheres (see "Phenomenology"), although no one will deny that of all those who believe in Islam not one believes in it in the "*same*" way as another and to this extent each of them is "unique", just as among citizens not one has the "same" attitude to the state as another if only because it is a matter of his attitude, and not that of *some-other*— all this much praised "uniqueness" which [according to Sancho] was so distinct from "*sameness*", *identity of the person*, that in all individuals who have so far existed he could hardly see anything but "specimens" of a species, is thus reduced here to the identity of a person with himself, as established by the police, to the fact that one individual is not some other individual. Thus Sancho, who was going to take the world by storm, dwindles to a clerk in a passport office.

On page 184 of the "Commentary" he relates with much unction and great self-enjoyment that he does not become replete when the Japanese Emperor eats, because his stomach and that of the Japanese Emperor are "unique", "incomparable stomachs", i.e., not the *same* stomachs. If Sancho believes that in this way he has abolished the social relations hitherto existing or even only the laws of nature, then his naiveté is excessively great and it springs merely from the fact that philosophers have not depicted social relations as the mutual relations of particular individuals identical with themselves, and the laws of nature as the mutual connections of these particular bodies.

The classic expression which Leibniz gave to this old proposition (to be found on the first page of any physics textbook as the theory of the impenetrability of bodies) is well known:

"However, every monad necessarily differs from every other; for in nature there are never two things that exactly coincide with each other." (Principia Philosophiae seu Theses, etc.)

Sancho's uniqueness is here reduced to a quality which he shares with every louse and every grain of sand.

The greatest disclaimer with which his philosophy could end is that it regards the realisation that Sancho is not Bruno, which is obvious to every country bumpkin and police sergeant, to be one of the greatest discoveries, and that it considers the fact of this difference to be a real miracle.

Thus the "critical hurrah" of our "virtuoso of thought" has become an uncritical miserere.

After all these adventures our "unique" squire again sails into the harbour of his native serf's cottage. "The title spectre of his book" rushes out to meet him "joyfully". Her first enquiry is: how is the ass?

Better than his master, replies Sancho.

Thanks be to God for so much goodness. But tell me now, my friend, what profit have you got out of your squiredom? What new dress have you brought me?

I have brought nothing like that, replies Sancho, but I have brought "the creative nothing, the nothing from which I myself as creator create everything". This means you will yet see me in the capacity of church father and archbishop of an island and, indeed, one of the best it is possible to find.

God grant it, my treasure, and may it be soon, for we sorely need it. But as regards the island you mention, I don't know what you mean.

Honey is not for the ass's mouth, replies Sancho. You will see it for ourself in due course, wife. But even now I can tell you that nothing is more pleasant in the world than the honour of seeking adventures as an egoist in agreement with himself and as the squire of the rueful countenance. True, most of these adventures do not "reach the final goal" so that "*human* requirement is satisfied" (*tan como el hombre* quería [as the human being desires]), for ninety-nine adventures out of a hundred go awry and follow a tangled course. I know this from experience, for in some of them I was cheated and from others I went home soundly pounded and thrashed. But in spite of all that, it is a fine thing, for at any rate the "unique" requirement is always satisfied when one wanders through the whole of history, quoting all the books in the Berlin reading-room, getting an etymological night's lodging in all languages, falsifying political facts in all countries, boastfully throwing down gages to all dragons and ostriches, elfs, field hobgoblings and "spectres", exchanging blows with all church fathers and philosophers and yet, finally, paying for it only with your own body (cf. Cervantes, I, Chapter 52).

Part II. Apologetical Commentary

Although formerly, when in a state of humiliation (Cervantes, Chapters 26 and 29), Sancho had all kinds of "doubts" about accepting an ecclesiastical benefice, nevertheless, after pondering over the changed circumstances and his earlier preparation as beadle to a religious brotherhood (Cervantes, Chapter 21), he finally decided to "get" this doubt "out of his head". He became archbishop of the island of Barataria and a cardinal and as such sits with solemn mien and arch-ecclesiastical dignity among the foremost of our Council. Now, after the long episode of "the book", we return to this Council.

True, we find that "brother Sancho" in his new station in life has changed considerably. He now represents the *ecclesia triumphans* — in contrast to the *ecclesia militans* [Church militant] in which he was before. Instead of the belligerent fanfares of "the book" there is a solemn seriousness; "Stirner" has taken the place of the "ego". This shows how true the French saying is: *qu'il n'y a qu'un pas du sublime au ridicule*. [There is only one step from the sublime to the ridiculous, an expression used by Napoleon on many occasions] Since he became a father of the church and began to write pastoral epistles, Sancho calls himself nothing but "Stirner". He learned this "unique" way of self-enjoyment from Feuerbach, but unfortunately it befits him no better than playing the lute does his ass. When he speaks of himself in the third person, everyone sees that Sancho the "creator", after the manner of Prussian non-commissioned officers, addresses his "creation" Stirner in the third person, and should on no account be confused with Caesar. [The reference is to Julius Caesar's Commentarii de bello Callico written in the third person about himself]

The impression is all the more comical because Sancho commits this inconsistency only in order to compete with Feuerbach. Sancho's "self-enjoyment" of his performance as a great man becomes here *malgré lui* an enjoyment for others.

The "*special*" thing that Sancho does in his "Commentary", insofar as we have not "used it up" already in the episode, consists in his regaling us with a new series of variations on the familiar themes already played with such long-winded monotony in "the book". Here Sancho's music, which like that of the Indian priests of Vishnu knows only one note, is played a few registers higher. But its narcotic effect remains, of course, the same. Thus, for example, the antithesis of "egoistical" and "holy" is again thoroughly kneaded, this time under the signboards of "interesting" and "uninteresting", and then of "interesting" and "absolutely interesting", an innovation which, incidentally, could only be of interest to lovers of unleavened bread, in common parlance matzos. One should not, of course, blame an "educated" Berlin petty bourgeois for the belletristic distortion of the interested into the interesting.

All the illusions which, according to Sancho's pet crotchet, were created by "schoolmasters" appear here "as difficulties — *doubts*", which "only spirit created" and which "the poor souls who allowed themselves to be talked into these doubts" "should ... overcome" by "*light-heartedness*" (the famous getting out of one's head) (p. 162). Then comes a "treatise" in which he considers whether "doubts" should be got out of one's head by "thinking" or by "thoughtlessness", and a critical-moral adagio in which he laments in minor chords:

"Thought must on no account be suppressed by rejoicing" (p. 166).

For the tranquillity of Europe, and especially of the oppressed *old merry and young sorry England* as soon as Sancho has become somewhat accustomed to his episcopal *chaise percée*, [night commode] he issues from this eminence the following gracious pastoral epistle:

"Civil society is not at all dear to Stirner, and he has no intention of extending it so that it swallows up the state and the family" (p. 189).

Let Mr. Cobden and Monsieur Dunoyer bear this in mind.

In his capacity of archbishop, Sancho immediately takes control of the spiritual police, and on page 193 he gives Hess a reprimand for confusing matters, which "are contrary to police regulations" and the more unpardonable the greater the efforts that our church father continually makes to establish identity. To prove to this same Hess that "Stirner" also possesses the "heroic courage of lying", that orthodox quality of the egoist in agreement with himself, he sings on page 188: "But Stirner does not say *at all* — contrary to what Hess makes him say — that the whole mistake of previous egoists was merely that they were not *conscious* of their egoism." Cf. "Phenomenology" and the entire "book". The other quality of the egoist in agreement with himself — credulity — he displays on page 182, where he "*does not dispute*" Feuerbach's opinion that "*the individual* is a communist". A further exercise of his police powers consists in censuring (on page 154) all his reviewers for not having dealt "in more detail with egoism as Stirner *conceives* it". Indeed, they all made the mistake of thinking that it was a question of actual egoism, whereas it was merely a question of "Stirner's" conception of it.

The "Apologetical Commentary" also proves Sancho's aptitude for acting as a church father by beginning with a piece of hypocrisy:

"A brief reply may be of benefit, if not perhaps to the reviewers named, then at least to some other reader of the book" (p. 147).

Here Sancho plays the devotee and asserts that he is prepared to sacrifice his valuable time for the "benefit" of the public, although he constantly assures us that he always has in view only his own benefit, and although he is only trying here to save his own clerical skin.

Thereby we have finished with the "special" of the "Commentary". The "*unique*" feature, which, however, occurs already in "the book", on page 49 1, has been kept by us in reserve not so much for the "benefit" of "some other reader" as for "Stirner's" own benefit. One hand washes the other, from which it indisputably follows that "the individual is a communist".

— Thought and Language —

One of the most difficult tasks confronting philosophers is to descend from the world of thought to the actual world. *Language* is the immediate actuality of thought. Just as philosophers have given thought an independent existence, so they were bound to make language into an independent realm. This is the secret of philosophical language, in which thoughts in the form of words have their own content. The problem of descending from the world of thoughts to the actual world is turned into the problem of descending from language to life.

We have shown that thoughts and ideas acquire an independent existence in consequence of the personal circumstances and relations of individuals acquiring independent existence. We have shown that exclusive, systematic occupation with these thoughts on the part of ideologists and philosophers, and hence the systematisation of these thoughts, is a consequence of division of labour, and that, in particular, German philosophy is a consequence of German petty-bourgeois conditions. The philosophers have only to dissolve their language into the ordinary language, from which it is abstracted, in order to recognise it, as the distorted language of the actual world, and to realise that neither thoughts nor language in themselves form a realm of their own, that they are only *manifestations* of actual life.

Sancho, who follows the philosophers through thick and thin, must inevitably seek the *philosophers stone,* the squaring of the circle and elixir of life, or a "*word*" which as such would possess the miraculous power of leading from the realm of language and thought to actual life. Sancho has been so infected by his long years of association with Don Quixote that he fails to notice that this "task" of his, this "vocation", is nothing but the result of his faith in weighty philosophical books of knight-errantry.

Sancho begins by showing us once again the domination of the holy and of ideas in the world, this time in the new form of the domination of language or phrase. Language, of course, becomes a phrase as soon as it is given an independent existence.

On page 151, Sancho calls the modern world "a world of phrases, a world where in the beginning was the word". He describes in more detail the motives for his chase after the magic word:

"Philosophical speculation strove to find a predicate which would be so universal as to include everyone in itself.... in order that the predicate should include everyone in it, each should appear in it as subject, i.e., not merely as what he is, but as who he is" (p. 152).

Since speculation "sought" such predicates, which Sancho had previously called vocation, designation, task, species, etc., therefore actual people up to now "*sought*" themselves "in the word, the logos, the predicate" (p. 153). Up to now one has used the name when one wanted to distinguish in language one individual from another, merely as an identical person. But Sancho is not satisfied with ordinary names; because philosophical speculation has set him the task of finding a predicate so universal that it would include in itself everyone as subject, he seeks the philosophical, abstract name, the "Name" that is above all names, the name of names, name as a category which, for example, would distinguish Sancho from Bruno, and both of them from Feuerbach, as precisely as their own proper names, and which would nevertheless be applicable to all three and also to all other people and corporeal beings — an innovation which would introduce the greatest confusion into all bills of exchange, marriage contracts, etc., and at one blow put an end to all notaries and registry offices. This miraculous name, this magic word, which in language spells the death of language, this asses' bridge leading to life and the highest rung of the Chinese celestial ladder is — *the unique*. The miraculous properties of this word are sung in the following stanzas:

"The unique one should be only the last, dying statement of you and me, should be only that statement which is transformed into opinion:

"a statement that is no longer a statement, "a muted, mute statement" (p. 153).

"With him" (the unique one) "what is not expressed is the chief thing" (p. 149). He "is without determination" (ibid.).

"He points to the content, lying outside or beyond the concept" (ibid.).

This is "a concept without determination and cannot be made more definite by any other concept" (p. 150).

This is the philosophical "christening" of worldly names (p. 150).

"The unique is a word devoid of thought.

"It has no thought content."

"It expresses a person" "that cannot exist a second time, and consequently cannot be expressed either;

"For if he could be expressed actually and completely, then he would exist a second time, he would exist in the expression" (p. 151).

Having thus sung the properties of this word, he celebrates in the following antistrophic stanzas the results obtained by the discovery of its miraculous power:

"With the unique one the realm of absolute thoughts is completed" (p. 150).

"He is the keystone of our world of phrases" (p. 151).

"He is logic that comes to an end as a phrase" (p. 153).

"In the unique one, science can merge in life,

"By transforming its this into such-and-such a one,

"Who no longer seeks himself in the word, the logos, the predicate" (p. 153).

True, as regards his reviewers Sancho has had the unpleasant experience of learning that the unique, too, can be "fixed as a concept", and "that is what the opponents do" (p. 149), who are so opposed to Sancho that they do not feel at all the expected magical effect of the magical word, but instead sing, as in the opera: *Ce nest pas ça, ce nest pas ça!* With great exasperation and solemn seriousness Sancho turns particularly against his Don Quixote-Szeliga, for in him the misunderstanding presupposes an open "rebellion" and a complete misapprehension of his position as a "creature".

"If Szeliga had understood that the unique, being a completely empty phrase or category, thereby is no longer a category, he might, perhaps, have recognised it as the name of that for which he still has no name" (p. 179).

Here, therefore, Sancho expressly recognises that he and his Don Quixote are striving towards one and the same goal, with the only difference that Sancho imagines that he has discovered the true morning star, whereas Don Quixote, still in darkness

Swims in the wild liver-sea

of the unfathomable world.

[Meister Kuonrat von Wurzeburc, Diu guldin Smitte, Verse 143]

Feuerbach said in his *Philosophie der Zukunft*, p. 49:

"Being, based on sheer inexpressibles, is therefore itself something inexpressible. Yes, the inexpressible. Where words end, only there does life begin, only there can the secret of being be deduced."

Sancho has found the transition from the expressible to the inexpressible, he has found the word which is simultaneously more and less than a word.

— Language and Life —

We have seen that the whole problem of the transition from thought to reality, hence from language to life, exists only in philosophical illusion, i.e., it is justified only for philosophical consciousness, which cannot possibly be clear about the nature and origin of its apparent separation from life. This great problem, insofar as it at all entered the minds of our ideologists, was bound, of course, to result finally in one of these knights-errant setting out in search of a word which, as a word, formed the transition in question, which, as a word, ceases to be simply a word, and which, as a *word*, in a mysterious superlinguistic manner, points from within language to the actual object it denotes; which, in short, plays among words the same role as the Redeeming God-Man plays among people in Christian fantasy. The emptiest, shallowest brain among the philosophers had to "end" philosophy by proclaiming his lack of thought to be the end of philosophy and thus the triumphant entry into "corporeal" life. His philosophising mental vacuity was already in itself the end of philosophy just as his unspeakable language was the end of all language. Sancho's triumph was also due to the fact that of all philosophers he was least of all acquainted with actual relations, hence philosophical categories with him lost the last vestige of connection with reality, and with that the last vestige of *meaning*.

So now go forth, pious and faithful servant Sancho, go or, rather, ride forth on your ass, to your unique's self-enjoyment, "use up" your "*unique*" to the last letter, the unique whose miraculous title, power and courage have already been sung by Calderón in the following words:

The unique —

The valiant fighter,

the generous leader,

the gallant knight,

the illustrious Paladin,

the always faithful Christian,

the fortunate Admiral of Africa,

the sovereign King of Alexandria,

the judge of Barbary,

the Cid of Egypt,

Marabout, and Grand Seignior

of Jerusalem.

[Calderón, La puenta de Vantible, Act 1. The words "The always faithful Christian" have been inserted by Marx and Engels]

"In conclusion, it would not be unsuitable to remind" Sancho, the Grand Seignior of Jerusalem, of Cervantes' "criticism" of Sancho in *Don Quixote*, Chapter 20, page 171, Brussels edition, 1617. (Cf. the "Commentary", p. 194.)

Footnotes

1. Max Stimer's book *Der Einzige und sein Eigenthum*, Leipzig, Wigand, 1845, was published in October-November 1844. Engels was one of the first readers of this book, for Wigand sent him the advance proofs. This is mentioned in the letter Engels wrote to Marx on November 19, 1844
2. ↑ Part One of Stirner's book, "*Der Mensch*" ("Man"), has the following structure: I. Ein Menschenleben (A Man's Life); II. Menschen der alten und neuen Zeit (People of Ancient and Modern Times): 1. Die Alten (The Ancients); 2. Die Neuen (The Moderns) — § 1. Der Geist (The Spirit), § 2. Die Besessenen (The Possessed), § 3. Die Hierarchie (Hierarchy); 3. Die Frcien (The Free Ones) — § 1. Der politische Liberalismus (Political Liberalism), §2. Der sociale Liberalismus (Social Liberalism), § 3. Der humane Liberalismus (Humane Liberalism)
3. ↑ *The campaigns of Sesostris* — according to the Greek historians Herodotus and Diodorus, campaigns by a legendary Egyptian pharaoh to conquer countries in Asia and Europe. *napoleon's expedition to Egypt* — a reference to the landing of the French army, commanded by General Bonaparte, in Egypt in the summer of 1798 and to the subsequent campaigns of this army to subdue Egypt and Syria. Napoleon's expedition to Egypt ended in failure in 1801
4. ↑ *The seven wise men* — a term usually applied to seven eminent Greek philosophers and statesmen who lived in the 6th century B.C.: Bias, Chilon, Cleobulus, Periander, Pittacus, Solon and Thales. *Neo-academists* — philosophers belonging to the Athenian school of neo-Platonism
5. ↑ *Brahm* (or Brahma, Brahman) — the basic category of ancient Hindu idealist philosophy denoting the essence of the universe, impersonal, immaterial, uncreated, illimitable, timeless. *Om* — ritualistic word invoking Brahma
6. ↑ From 987, when Hugh Capet claimed the throne of France, until the French Revolution, the kings of France were in fact members of the Capet dynasty, for both the Valois, who ruled from 1328, and the Bourbons, who followed them in 1589, were branches of the Capet family. Louis XVI, a member of the Bourbon dynasty, was executed in January 1793 by order of the National Convention
7. ↑ Until the revolution of 1848 smoking was prohibited in the streets of Berlin and in the Tiergarten (a park in the city) under penalty of a fine or corporal punishment
8. ↑ The attempt which Enfantin made in 1832 to establish a labour commune in Ménilmontant, then a suburb of Paris, led to legal proceedings against the Saint-Simonists, who were accused of immorality and the spread of dangerous

ideas. On August 28, 1832, Enfantin was sentenced to one year's imprisonment but was released before serving the full term. Afterwards, Enfantin and several of his followers went to Egypt, where he worked as an engineer

9. ↑ *Wasserpolacken* (literally water Poles) — nickname given to the Silesian Poles in Germany
10. ↑ A reference to the bombardment of Chinese maritime towns and ports on the Yangtse and other rivers by the British naval and land forces during the First Opium War, Britain's war of conquest against China waged from 1839 to 1842. With this war began the transformation of China into a semi-colony
11. ↑ *Deux amis de la liberté*" ("Two friends of freedom") — pseudonym used by Fr. Marie Kerverseau and G. Clavelin, authors of the *Histoire de la Révolution de 1789*, a work in twenty volumes published in Paris at the end of the 18th and the beginning of the 19th century
12. ↑ *Habits bleus*" ("blue coats") — a name given to the soldiers of the French Republic at the end of the 18th century because of the colour of their uniform. In a wider sense it was applied to the Republicans as distinct from the royalists, who were called *Blancs*("Whites")
13. ↑ Cf. Romans 9:16: "So then it is not of him that willeth, nor of him that runneth, but of God that sheweth mercy."
14. ↑ *Kupfergraben* — the name of a canal in Berlin. Hegel lived on the Kupfergraben embankment
15. ↑ *Hanseatic League* (Hanse) — a league of German and other North-European merchant cities, situated on the Baltic and the North Sea and the rivers flowing into them. At one time it also included several Dutch cities. The heyday of the Hanseatic League was the second half of the 14th century. It began to decline and to disintegrate towards the end of the 15th century but continued to exist formally until 1669
16. ↑ The Continental System, or the Continental Blockade, proclaimed by Napoleon I in 1806, after Prussia's defeat, prohibited trade between the countries of the European Continent and Great Britain. This made the import into Europe of a number of products, including sugar and coffee, very difficult. Napoleon's defeat in Russia in 1812 put an end to the Continental System.
17. ↑ *Tugendbund* (League of Virtue) — secret political society which was founded in Prussia in 1808. Its principal aims were to foster patriotic feelings among the population and to organise the struggle for the liberation of Germany from the Napoleonic occupation and for the establishment of a constitutional system in the country. At Napoleon's request the Tugendbund was formally dissolved in 1809 by the King of Prussia but it actually continued to exist until the end of the Napoleonic wars

18. ↑ *Cercle social* — an organisation established by democratic intellectuals in Paris in the first years of the French Revolution. Its chief spokesman, Claude Fauchet, demanded an equalitarian division of the land, restrictions on large fortunes and employment for all able-bodied citizens. The criticism to which Fauchet and his supporters subjected the formal equality proclaimed in the documents of the French Revolution prepared the ground for bolder action in defence of the destitute by Jacques Roux, Théphile Leclerc and other members of the radical-plebeian "*Enragés*
19. ↑ The end of this sentence from the words "the bourgeois ... express ... the rule of the proprietors ..." and the following five paragraphs up to and including the words "customs duties which hampered commerce at every rum, and they" are part of the manuscript discovered in the early 1960s and first published (in German) in the *International Review of Social History*, Vol. VII, 1962, Part 1. The text is written on two pages, the beginning of the first one is damaged
20. ↑ The motion of the Bishop of Autun (Talleyrand) — one of the representatives of the clergy who supported the decision of the deputies of the Third Estate to transform the States-General (a consultative organ based on social estates) into a National Assembly(later, the Constituent Assembly) — was designed to extend the powers of the Assembly. It proposed that the deliberations of the Assembly should no longer be restricted to matters mentioned in the Cahiers de doléances — lists of grievances and instructions given by the constituents of each estate to their deputies in connection with the convocation of the States-General (*États généraux*) — and that the deputies should have the right to decide each question according to their own judgment. *Bailliages* — bailiwicks in pre-revolutionary France, also electoral districts during the elections to the States-General; *divisions des ordres* — each *bailliage* was divided into three social estates: the nobility, the clergy and the Third Estate. The figure 431 is apparently a slip of the pen, for there were 531 *divisions des ordres*
21. ↑ *Jeu de paume* — a tennis-court in Versailles. On June 20, 1789, the deputies of the Third Estate, who on June 17 proclaimed themselves a National Assembly, met in this building (because their official meeting-place had been closed by order of the King) and took a solemn oath not to separate until they had given France a constitution. *Lit de justice* — sessions of the French parliaments (the supreme judicial bodies in pre-revolutionary France) in the presence of the King. Orders by the King issued at these sessions had the force of law. The reference here is to the meeting of the States-General on June 23, 1789. At this meeting the King declared the decisions adopted by the Third Estate on June 17 null and void and demanded the immediate dispersal

of the Assembly, but the deputies of the Third Estate refused to obey and continued their deliberations

22. ↑ *Jacquerie* — French peasant revolt which took place in May and June 1358 and was supported by the poor in a number of cities. *A peasant rebellion under the leadership of Wat Tyler*flared up in England in the summer of 1381. It had the support of ‘ the lower strata of the London population, who opened the gates of the capital to the insurgents. Some demands of the latter, for example, the abolition of the Statute of Labourers, were also in the interest of the plebeian townsmen. *Evil May Day* — name given to the uprising of the poorer citizens of London on May 1, 1517. It was directed against the increasing power of foreign merchants and usurers. *A peasant uprising under the leadership of Robert Kett* (a local squire and owner of a tannery) took place between June and August 1549 in East Anglia. Among the insurgents were many unemployed weavers, ruined artisans and other destitute people. With the help of the town poor the insurgents seized Norwich
23. ↑ This refers to events connected with the Chartist movement in England. When Parliament rejected their first Petition in July 1839, the Chartists attempted to call a general strike (a “sacred month”). At the beginning of November 1839 a rising of miners took place in South Wales, which was crushed by police and government troops. In July 1840, the National Charter Association was founded which united a considerable number of the country’s local Chartist organisations. In August 1842, after the second Petition had been rejected by Parliament, spontaneous action of the workers took place in many industrial regions of the country. In Lancashire and in a considerable part of Cheshire and Yorkshire the strikes were very widespread, and in a number of places they grew into spontaneous uprisings
24. ↑ *Free-thinkers* (*Freijeister* — by spelling the word according to the Berlin dialect pronunciation the authors have given the name an ironical note) — an allusion to “The Free”, a group of Berlin Young Hegelians which came into being in the first half of 1842. Among its principal members were Bruno Bauer, Edgar Bauer, Eduard Meyen, Ludwig Buhl and Max Stirner. The existing system was criticised by “The Free” in an abstract way, their statements were devoid of real revolutionary content, their ultra-radical form often compromised the democratic movement. Many of “The Free” renounced radicalism in the following years. For the criticism of “The Free” in Marx’s early writings see MECW, Vol. 1, pp. 287, 390, 393-95
25. ↑ Congregatio de propaganda fide (Congregation for Propagating the Faith) — an organisation founded by the Pope in 1622 in order to propagate Catholicism in all countries and to fight heretics
26. ↑ This refers to the movement for a democratic electoral reform whose members — republican democrats and petty-bourgeois socialists — gathered

round *La Réforme*, an opposition newspaper published in Paris from 1843. The supporters of *La Réforme* were also known as the socialistic democratic party

27. ↑ Capitularies — legislative or administrative ordinances of the Frankish kings. Many of these enactments legalised serfdom and were designed to ensure stricter fulfilment by the peasants of the numerous obligations imposed on them (Charlemagne's well-known capitulary referred to in the text is presumably the *Capitulare de villis* — Capitulary on Royal Estates — issued about A.D. 800). Some of these acts threatened peasants who were disobedient, took part in revolts and so on with severe punishment (for example, Charlemagne's Capitulary on Saxony of 782 directed against the fight of the free Saxon peasants against the Frankish conquerors)
28. ↑ An allusion to disturbances which took place in Catalonia at the beginning of July 1845 and were caused by the attempt of the government to introduce a law under which one man out of five was to serve in the army. The disturbances were brutally suppressed
29. ↑ *Barataria* — the island of which Sancho Panza was made governor in Cervantes' Don Quixote
30. ↑ *Dioscuri* — Castor and Pollux (or in Greek Polydeuces), heroes of classical mythology, the twin sons of Zeus, by whom they were turned into the constellation Gemini (the Twins); as such they were considered to be the patrons of seamen
31. ↑ *Rumford broth* — thin soup for the poor prepared from bones and cheap substitutes; the recipe for it was made up at the end of the 18th century by Count Rumford (alias Benjamin Thompson)
32. ↑ *Banquerouse cochonne*(swinish bankruptcy) — the 32nd of the 36 types of bankruptcy described by Fourier in his work *Des trois unités externes* published in the journal *La Phalange*, 1845, Vol. 1. Excerpts from this work are given by Engels in his article "A Fragment of Fourier's on Trade" (for the passage about "swinish bankruptcy" see MECW, Vol. 4, p. 638)
33. ↑ Part Two of Stirner's book *Der Einzige und sein Eigenthum* — "Ich" ("Ego") — is subdivided as follows: I. Die Eigenheit (Peculiarity); II. Der Eigner (The Owner): 1. Meine Macht (My Power), 2. Mein Verkehr (My Intercourse), 3. Mein Selbstgenuss (My Self-Enjoyment); III. Der Einzige (The Unique).
34. ↑ *Orphanage-Francke* — the nickname stems from the fact that August Hermann Francke founded an orphanage and several other philanthropic institutions for children in Halle at the end of the 17th century
35. ↑ The maxim "Know Thyself" was written over the entrance of Apollo's temple at Delphi
36. ↑ According to Bentham's utilitarian ethics, actions were to be considered good if they produced a greater amount of pleasure than suffering. The compilation of long tedious lists cataloguing pleasure and suffering, and their

subsequent balancing in order to determine the morality of an action, is here called by Marx and Engels “Bentham’s book-keeping

37. ↑ In the middle of the 19th century Moabit was a north-western suburb of Berlin; Köpenick — a south-eastern suburb of Berlin, and the Hamburger Tor (Hamburg Gate) — a gate at the northern boundary of Berlin
38. ↑ *Nante the loafer (Eckensteher Nante)* — a character in Karl von Holtei’s play *Ein Trauerspiel in Berlin*. On the basis of this prototype Fritz Beckmann, a well-known German comedian, produced a popular farce *Der Eckensteher Nante im Verhör*. The name Nante became a byword for a garrulous, philosophising wag, who seizes every opportunity to crack stale jokes in the Berlin dialect
39. ↑ Emperor Sigismund handed over Jan Huss to the Council of Constance (1414-15) despite the safe conduct he had granted him. Francis I, who was defeated at Pavia (1525) and taken prisoner by Charles V, was released only after renouncing his claims to Milan and Burgundy (Madrid Treaty of 1526). But after his release he repudiated the treaty
40. ↑ *Blocksberg* — popular name of several German mountains and in particular of the Brocken, the highest peak of the Harz Mountains. According to German folklore, the witches meet to celebrate their Sabbath on the Blocksberg
41. ↑ According to legend, the early Christian Saint Ursula and “her eleven thousand virgins” were martyred in Cologne. The alleged number of virgins is probably due to the name of Ursula’s companion, Undecimilla, which in Latin means “eleven thousand
42. ↑ *Caius* — a name adopted by many textbooks and other works on formal logic to denote a human being, especially in syllogisms
43. ↑ Apparently a reference to Gottlieb Konrad Pfeffel’s book *Biographie eines Pudels*
44. ↑ *Spanso bocko* — one of the most cruel forms of corporal punishment, which was used by the colonialists in Surinam (in the north-eastern part of South America)
45. ↑ The uprising of Negro slaves which took place in Haiti in 1791 marked the beginning of a revolutionary movement against the colonial regime. Toussaint Louverture, the leader of the insurgents, played an outstanding part in the war of liberation which the Negroes waged against the French, English and Spanish colonialists. In the course of the struggle, which ended with the proclamation of Haiti’s independence in January 1804, slavery was abolished and subsequently the estates of the planters were divided among the former slaves
46. ↑ *The Historical School of Law* — a trend in German historiography and jurisprudence in the late 18th century. The representatives of this school,

Gustav Hugo, Friedrich Karl Savigny and others, sought to justify the privileges of the nobility and feudal institutions by referring to the inviolability of historical traditions. *Romanticists* — adherents of reactionary romanticism in the social sciences who tried to vindicate the Middle Ages and the feudal system and to oppose them to the ideas of bourgeois Enlightenment, democracy and liberalism. Among the prominent ideologists of romanticism were Louis Gabriel Bonald, Joseph de Maistre, Karl Ludwig Haller and Adam Müller. For a criticism of these two trends see Marx's works: "The Philosophical Manifesto of the Historical School of Law" and "Contribution to the Critique of Hegel's Philosophy of Law. Introduction" (MECW, Vols. 1 and 3)

47. ↑ *The "Ten Tables"* — the original version of the "Twelve Tables" (*lex duoderim tabularum*), the oldest legislative document of the Roman slave-owners' state. These laws were enacted as a result of the struggle which the plebeians waged against the patricians during the republican period in the middle of the 5th century B.C.; they became the point of departure for the further development of Roman civil law
48. ↑ For the *Corn Laws* The Anti-Corn Law League was founded in 1838 by the Manchester manufacturers Cobden and Bright. The English Corn Laws, first adopted in the 15th century, imposed high tariffs on imported cereals in order to maintain high prices for them in the home market. In the first third of the 19th century, in 1815, 1822 and later, several laws were passed changing the conditions for corn imports, and in 1828 a sliding scale was introduced which raised import tariffs on corn when prices in the home market declined and, on the other hand, lowered tariffs when prices rose in Britain. The League widely exploited the popular discontent over the raising of corn prices. In its efforts to obtain the repeal of the Corn Laws and the establishment of complete freedom of trade, it aimed at weakening the economic and political positions of the landed aristocracy and lowering the cost of living thus making possible a lowering of the workers' wages. The struggle between the industrial bourgeoisie and the landed aristocracy over the Corn Laws ended with the repeal of these laws in 1846.
49. ↑ This refers to the Law of 1844 which made it very difficult to obtain a divorce. The Bill was drafted in 1842 on the instructions of Frederick William IV by Savigny, one of the founders of the Historical School of Law (see Note 46), who was Prussian Minister for the Revision of Laws from 1842 to 1848
50. ↑ *Leges barbarorum* (laws of the barbarians) — codes of law which originated between the 5th and the 9th centuries and were, in the main, a written record of the customary or prescriptive law of the various Germanic tribes. *Consuetudines feudorum* (feudal customs) — a compilation of medieval feudal laws which was made in Bologna in the last third of the 12th

century. *Jus talionis*(right of retaliation) — the right of retaliation by inflicting a punishment of the same kind ("an eye for an eye, a tooth for a tooth"). The old German *Gewere* — the legitimate rule of a free man over a piece of land where he exercised sovereign authority and was responsible for the protection of every person and thing. *Compensatio* — the balancing of claim and counter-claim against each other. *Satisfactio* — reparation, or atonement, for an offence; it can also mean satisfying a creditor not by repaying the debt incurred but by some other service

51. ↑ *The Holy Hermandad* (Holy Brotherhood) — league of Spanish towns set up at the end of the 15th century with the approbation of the king, who sought to make use of the bourgeoisie in the struggle between absolutism and the powerful feudal lords. From the middle of the 16th century the armed detachments of the Hermandad performed police duties. The term "Holy Hermandad" was later used ironically for the police
52. ↑ *Spandau* — at that time a Prussian fortress west of Berlin with a jail for political prisoners
53. ↑ *Landwehrgraben* — a canal in Berlin which extended up to Charlottenburg, then a Berlin suburb. It is possible that Marx and Engels are alluding to Egbert Bauer's publishing house in Charlottenburg, where Szeliga's works were published
54. ↑ The following section is a critical analysis of the second section, "Mein Verkehr" ("My Intercourse"), Chapter Two, Part Two of Stirner's book *Der Einzige und sein Eigenthum*. From the introductory remarks of Marx and Engels to this part of their work (see this volume, p. 240) it follows that they intended to use the heading "My Intercourse" and to mark it with the letter "B", for the preceding section is called "A. Meine Macht" ("A. My Power"), and the following one "C. Mein Selbstgenuss" ("C. My Self-Enjoyment"). The section "B. My Intercourse" probably consisted of three subsections: "1. Society", "If. Rebellion" and "III. Union." The first three subdivisions and the beginning of the fourth subdivision of the section "1. Society" are missing. When Paul Weller was preparing *The German Ideology* for publication as Band 5, Erste Abteilung of *Marx/Engels Gesamtausgabe*(MEGA), he suggested that the subsection "I. Society" may have consisted of five parts. The heading of the first is unknown, but it might have been "1. Die verstirnerte Gesellschaft" ("1. Stirnerised Society"), or "1. Die Gesellschaft im allgemeinen"' ("1. Society in General"), or "1. Die menschliche Gesellschaft" ("1. Human Society"). That of the second was probably "2. Die Gesellschaft als Gefängnisgesellschaft" ("2. Society as Prison Society"); of the third, "3. Die Gesellschaft als Familie" ("3. Society as a Family"); of the fourth, "4. Die Gesellschaft als Staat" ("Society as State"), of which only the last portion has been found. The fifth part has been preserved in its entirety and is called "5.

Die Gesellschaft als bürgerliche Gesellschaft" ("5. Society as Bourgeois Society").

55. ↑ *The September Laws* — reactionary laws promulgated by the French Government in September 1835. They restricted the rights of juries and introduced severe measures against the press. The clauses directed against the latter provided for higher amounts to be deposited as security by periodical publications, and made the people responsible for publications directed against private property and the existing political regime liable to imprisonment and heavy fines
56. ↑ The reference is apparently to the *Commissions of the Estates*in the Landtags (provincial diets), which were instituted in Prussia in June 1842. Elected by the Landtags from their deputies according to the estates principle, they formed a single advisory body known as the "United Commissions". With the help of this body, which was a mockery of representative institution, Frederick William IV hoped to enforce new taxes and obtain a loan
57. ↑ When the Corn Laws were repealed in 1846, a small, temporary tariff on the import of corn was retained until 1849. *Magna Charta Libertatum* — the charter which the insurgent barons, who were supported by knights and townsmen, forced King John of England to sign at Runnymede on June 15, 1215. Magna Charta limited the powers of the king, mainly in the interests of the feudal lords, and also contained some concessions to the knights and the towns
58. ↑ Under the leadership of Themistocles the Greeks defeated the Persians in the naval battle of Salamis in 480 B.C. After the Greek War of Independence (1821-29) against Turkish rule, Britain, Russia and France compelled the new Greek state to adopt a monarchical form of government, and placed the 17-year-old prince Otto of Bavaria on the Greek throne
59. ↑ Marx and Engels are alluding to Voltaire's description of Habakkuk. There is a direct reference to it in their article "Konflikte zwischen Polizei und Volk. — Über die Ereignisse auf der Krim" published on July 9, 1855. The expression "*capable de tout*" (capable of anything) is used here ironically, i.e., "capable of nothing
60. ↑ An allusion to the fact that in the summer of 1845 Stirner attempted to earn his living by selling milk since he could not exist on the proceeds from his literary work. But the undertaking proved a complete failure, and the curdled milk had to be poured down the drain
61. ↑ *The Pandects* are part of a compendium of Roman civil law (Corpus juris civilis) made by order of the Byzantine Emperor Justinian I in the 6th century. They contained extracts from the works of prominent Roman jurists
62. ↑ A reference to the British and Dutch East India Companies which were founded at the beginning of the 17th century. They had the monopoly, of

trade with the East Indies and played a decisive part in the establishment of the British and Dutch colonial empires

63. ↑ *The Preussische Seehandlungsgesellschaft* (Prussian Maritime Trading Company) was founded as a commercial and banking company in 1772 and granted a number of important privileges by the state. It advanced big loans to the government and in fact became its banker and broker
64. ↑ *Levons-nous!* (Let us rise up!) — part of the motto of the *Révolutions de Paris*, a revolutionary-democratic weekly which was published in Paris from July 1789 to February 1794 (until September 1790 its editor was Elisée Lousatalot). The entire motto was: "*Les grands ne nous paraissent grands que parce que nous sommes à genoux: levons-nous!*" ("The great only seem great to us because we are on our knees: Let us rise up!")
65. ↑ *Der hinkende Botte,* also called *Der hinkende Bote* (The Lame Messenger) — a name given to a sort of popular almanac which contained rather stale news relating to events of the preceding year
66. ↑ *Straubinger* — a name for Gerinan travelling journeymen. In their works and letters Marx and Engels frequently applied it ironically to artisans who remained under the influence of backward guild notions and believed that society could abandon large-scale capitalist industry and return to the petty handicraft stage of production
67. ↑ Mozart's *Requiem* was completed, on the basis of his manuscript notes, by Franz Xaver Süssmayer
68. ↑ *Organisers of labour* — an allusion to the utopian socialists (in particular Fourier and his followers) who put forward a plan for the peaceful transformation of society by means of associations, that is, by "organisation of labour", which they opposed to the anarchy of production under capitalism. Some of these ideas were used by the French petty-bourgeois socialist Louis Blanc in his book *Organisation du travail* (Paris, 1839) in which he proposed that the bourgeois state should transform contemporary society into a socialist society
69. ↑ *Willenhall*, a town in Staffordshire, England, with a considerable iron industry
70. ↑ An allusion to the fact that Max Stirner dedicated his book to his wife Marie Dähnhardt. The phrase "the title spectre of his book" was derived from Stirner's phrase "the title spectre of her book". In his book Der Einzige und sein Eigenthum he used it in relation to Bettina von Arnim's work, *Dies Buch gehört dem König*
71. ↑ This refers to one of the main principles of the "Declaration of the Rights of Man and the Citizen" (*Déclaration des droits de 1'homme et du citoyen*), a preamble to the Constitution adopted by the French Convention in 1793 during the revolutionary dictatorship of the Jacobins. The last article, the 35th,

of the Declaration reads: “When the government violates the rights of the people, insurrection is the imprescriptible right and the irremissible duty of the people as a whole and of each of its sections

72. ↑ According to the Bible (Genesis 41:18-20), the Egyptian pharaoh dreamed that seven fat cows were eaten by seven lean cows but the latter remained just as lean as before. According to the interpretation given to the pharaoh by Joseph, the dream meant that Egypt would have rich harvests for seven years to be followed by seven years of drought and famine.
73. ↑ *The Customs Union* (*Zollverein*) of German states (initially they numbered 18), which established a common customs frontier, was set up in 1834 and headed by Prussia. By the 1840s the Union embraced most of the German states, with the exception of Austria, the Hanseatic cities (Bremen, Hamburg, Lübeck) and a few small states. Brought into being by the necessity to create an all-German market, the Customs Union became a factor conducive to the political unification of Germany.
74. ↑ *The Cyrenaic school* — a school of ancient Greek philosophy founded at the beginning of the 4th century B.C. by Aristippus of Cyrene, a pupil of Socrates. The Cyrenaics were agnostics, adopted a critical attitude to religion and regarded pleasure *(hedone)* as the aim of life
75. ↑ Kupfergraben — the name of a canal in Berlin. Hegel lived on the Kupfergraben embankment.

Close of the Leipzig Council

After driving all their opponents from the Council, Saint Bruno and Saint Sancho, also called Max, conclude an eternal alliance and sing the following touching duet, amicably nodding their heads to one another like two mandarins.

Saint Sancho.

"The critic is the true spokesman of the mass.... He is its sovereign and general in the war of liberation against egoism." (The book, p. 187.)

Saint Bruno.

"Max Stirner is the leader and commander-in-chief of the Crusaders" (against criticism). "At the same time he is the most vigorous and courageous of all fighters." (Wigand, [Bruno Bauer, "Charakteristik Ludwig Feuerbachs"] p. 124.)

Saint Sancho.

"We pass on now to placing political and social liberalism before the tribunal of humane or critical liberalism" (i.e., critical criticism). (The book, p. 163.)

Saint Bruno.

"Confronted by the unique and his property, the political liberal, who desires to break down self-will, and the social liberal, who desires to destroy property, both collapse. They collapse under the critical" (i.e., stolen from criticism) "knife of the unique." (Wigand, p. 124.)

Saint Sancho.

"No thought is safe from criticism, because criticism is the thinking mind itself ... Criticism, or rather he" (i.e., Saint Bruno). (The book, pp. 195, 199.)

Saint Bruno (interrupts him, making a boss).

"The critical liberal alone ... does not fall [before] criticism because he himself is [the critic]." [Wigand, p. 124.]

Saint Sancho.

"Criticism, and criticism alone, is abreast of the times.... Among social theories, criticism is indisputably the most perfect.... In it the Christian principle of love, the true social principle, reaches its purest expression, and the last possible experiment is made to release people from exclusiveness [and] repulsion; it is a struggle against egoism in its simplest and therefore its most rigid form." (The book, p. 177.)

Saint Bruno.

“This ego is ... the completion and culminating point of a past historical epoch. The unique is the last refuge in the old world, the last hiding-place from which the old world can deliver its attacks” on critical criticism....... This ego is the most extreme, the most powerful and most mighty egoism of the old world” (i.e., of Christianity).... “This ego is substance in its most rigid rigidity.” (Wigand, p. 124.)

After this cordial dialogue, the two great church fathers dissolve the Council. Then they silently shake hands. The unique “forgets himself in sweet self-oblivion” without, however, getting “completely lost”, and the critic “smiles” three times and then “Irresistibly, confident of victory and victorious, pursues his path”.

Part IV: True Socialism

The relation between German socialism and the proletarian movement in France and England is the same as that which we found in the first volume (cf. "Saint Max", "Political Liberalism") between German liberalism, as it has hitherto existed, and the movement of the French and English bourgeoisie Alongside the German communists, a number of writers have appeared who have absorbed a few French and English communist ideas and amalgamated them with their own German philosophical premises. These "socialists" or "true socialists", as they call themselves, regard foreign communist literature not as the expression and the product of a real movement but as purely theoretical writings which have been evolved — in the same way as they imagine the German philosophical systems to have been evolved — by a process of "pure thought". It never occurs to them that, even when these writings do preach a system, they spring from the practical needs, the conditions of life in their entirety of a particular class in a particular country. They innocently take on trust the illusion, cherished by some of these literary party representatives, that it is a question of the "most reasonable" social order and not the needs of a particular class and a particular time. The German ideology, in the grip of which these "true socialists" remain, prevents them from examining the real state of affairs. Their activity in face of the "unscientific" French and English consists primarily in holding up the superficiality and the "crude" empiricism of these foreigners to the scorn of the German public, in eulogising "German science" and declaring that its mission is to reveal for the first time the truth of communism and socialism, the absolute, *true* socialism. They immediately set to work discharging this mission as representatives of "German science", although they are in most cases hardly more familiar with "German science" than they are with the original writings of the French and English, which they know only from the compilations of Stein, Oelckers [Lorenz von Stein, Der Socialismus und Communismus des heutigen Franhreichs. Theodor Oelckers, Die Bewegung des Socialismus und Communismus] , etc. And what is the "*truth*" which they impart to socialism and communism? Since they find the ideas contained in socialist and communist literature quite unintelligible — partly by reason of their ignorance even of the literary background, partly on account of their above-mentioned misunderstanding of this literature — they attempt to clarify them by invoking the German ideology and notably that of Hegel and Feuerbach. They detach the communist systems, critical and polemical writings from the real movement, of which they are but the expression, and force them into an arbitrary connection with German philosophy. They detach the consciousness of certain historically conditioned spheres of life from these spheres and evaluate it in terms of true, absolute, i.e., German philosophical consciousness. With perfect consistency they transform the relations of these particular individuals into relations of "Man"; they interpret the thoughts of these particular individuals concerning their own relations as thoughts about "Man". In so doing, they have abandoned the real historical basis and returned to that of ideology, and since they are ignorant of the real connection, they can without difficulty construct some fantastic relationship with the help of the "absolute" or some other ideological method. This translation of French ideas into the language of the German ideologists and this arbitrarily constructed relationship between communism and German ideology, then, constitute so-called "true socialism", which is loudly proclaimed, in the terms used by the Tories for the English constitution, to be "the pride of the nation and the envy of all neighbouring nations".

Thus "true socialism" is nothing but the transfiguration of proletarian communism, and of the parties and sects that are more or less akin to it, in France and England within the heaven of the German mind and, as we shall also see, of the German sentiment. True socialism, which claims to be based on "science", is primarily another esoteric science; its theoretical literature is intended only for those who are initiated into the mysteries of the "thinking mind". But it has an exoteric literature as well; the very fact that it is concerned with social, exoteric relations means that it must carry on some form of propaganda. In this exoteric literature it no longer appeals to the German "thinking mind" but to the German "sentiment". This is all the easier since true socialism, which is no longer concerned with real human beings but with "Man", has lost all revolutionary enthusiasm and proclaims instead the universal love of mankind. It turns as a result not to the Proletarians but to the two most numerous classes of men in Germany, to the petty bourgeoisie with its philanthropic illusions and to the ideologists of this very same petty bourgeoisie: the philosophers and their disciples; it turns, in general, to that "common", or uncommon, consciousness which at present rules in Germany.

The conditions actually existing in Germany were bound to lead to the formation of this hybrid sect and the attempt to reconcile communism with the ideas prevailing at the time. It was just as inevitable that a number of German communists, proceeding from a philosophical standpoint, should have arrived, and still arrive, at communism by way of this transition while others, unable to extricate themselves from this ideology, should go on preaching true socialism to the bitter end. We have, therefore, no means of knowing whether the "true socialists" whose works were written some time ago and are criticised here still maintain their position or whether they have advanced beyond it. We are not at all concerned with the individuals; we are merely considering the printed documents as the expression o a tendency which was bound to occur in a country so stagnant as Germany.

But in addition true socialism has in fact enabled a host of Young-German literary men, [1] quacks and other literati to exploit the social movement. Even the social movement was at first a merely literary one because of the lack of *real*, passionate, practical party struggles in Germany. True socialism is a perfect example of a social literary movement that has come into being without any real party interests and now, after the formation of the communist party, it intends to persist in spite of it. It is obvious that since the appearance of a real communist party in Germany, the public of the true socialists will be more and more limited to the petty bourgeoisie and the sterile and broken-down literati who represent it.

I. Die Rheinischen Jahrbücher, Or The Philosophy of True Socialism

A. "Communismus, Socialismus, Humanismus"

Rheinische Jahrbücher, 1. BD., P. 167 et seq.

We begin with this essay [by Hermann Semmig] because it displays quite consciously and with great self-confidence the national German character of true socialism.

Page 168: "It seems that the French do not understand their own men of genius. At this point German science comes to their aid and in the shape of socialism presents the most reasonable social order, if one can speak of a superlative degree of reasonableness."

"German science" here, therefore, presents a social order, in fact "the most reasonable social order", "in *the shape of* socialism". Socialism is reduced to a branch of that omnipotent, omniscient, all-embracing German science which is even able to set up a society. It is true that socialism is French in origin, but the French socialists were "*essentially*" *Germans*, for which reason the real Frenchmen "did not understand" them. Thus the writer can say:

"Communism is French, socialism is German; the French are lucky to possess so apt a social instinct, which will serve them one day as a substitute for scientific investigation. This result has been determined by the course of development of the two nations; the French arrived at communism by way of politics" (now it is clear, of course, how the French people came to communism); "the Germans arrived at socialism" (namely "true socialism") "by way of metaphysics, which eventually changed into anthropology. Ultimately both are resolved in humanism."

After having transformed communism and socialism into two abstract theories, two principles, there is, of course, nothing easier than to excogitate at will any Hegelian unity of these, two opposites and to give it any vague name one chooses. One has thereby not only submitted "the course of development of the two nations" to a piercing scrutiny but has also brilliantly demonstrated the superiority of the speculative individual over both Frenchmen and Germans.

Incidentally, the sentence is copied more or less literally from *Püttmann's Bürgerbuch*, p. 43 and elsewhere [This refers to the article "Ueber die Noth in unserer Gesellschaft und deren Abhülfe" by Moses Hess published in Deutsches Bürgerbuch für 1845]; the writer's "scientific investigation" of socialism is likewise limited to a reinterpretative reproduction of ideas contained in this book, in the *Einundzwanzig Bogen* and in other writings dating from the early days of German communism.

We will only give a few examples of the objections raised to communism in this essay:

Page 168: "Communism does not combine the atoms into an organic whole."

The demand that the "atoms" should be combined into an organic whole" is no more realistic than the demand for the squaring of the circle.

"Communism. as it is actually advocated in France, its main centre, takes the form of crude opposition to the egoistical dissipation of the shopkeeper's state; it never transcends this political opposition; it never attains to unconditional, unqualified freedom" (ibid.).

Voilà the German ideological postulate of " unconditional, unqualified freedom", which is only the practical formula for "unconditional, unqualified thought". French communism is admittedly "crude" because it is the theoretical expression of a *real* opposition; however, according to the writer, French communism ought to have transcended this opposition by imagining it to be already overcome. Compare also *Bürgerbuch*, p. 43, etc.

"Tyranny can perfectly well persist within communism, since the latter refuses to permit the continuance of the species" (p. 168).

Hapless species! "Species" and "tyranny" have hitherto existed *simultaneously*; but it is precisely because communism *abolishes* the "species" that it can allow "tyranny" to *persist.* And how, according to our true socialist, does communism set about abolishing the "species"? It "has the masses in view" (ibid.).

"In communism man is not conscious of his essence ... his dependence is reduced by communism to the lowest, most brutal relationship, to dependence on crude matter — the separation of labour and enjoyment. Man does not attain to free moral activity."

To appreciate the "scientific investigation" which has led our true socialist to this proposition, it is necessary to consider the following passage:

"French socialists and communists ... have by no means theoretically understood the essence of socialism ... even the radical" (French) "communists have still by no means transcended the antithesis of labour and enjoyment ... have not yet risen to the idea of free activity.... The only difference between communism and the world of the shopkeeper is that in communism the complete alienation of real human property is to be made independent of all fortuity, i.e., is to be idealised" (Bürgerbuch, p. 43).

That is to say, our true socialist is here reproaching the French for having a correct consciousness of their actual social conditions, whereas they ought to bring to light "Man's" consciousness of "*his* essence". All objections raised by these true socialists against the French amount to this, that they do not consider Feuerbach's philosophy to be the quintessence of their movement as a whole. The writer proceeds from the already existing proposition of the separation of labour and enjoyment. Instead of starting with this proposition, he ideologically turns the whole thing upside-down, begins with the missing consciousness of man, deduces from it "dependence on crude matter" and assumes this to be *realised* in the "separation of labour and enjoyment". Incidentally we shall see later on where our true socialist gets to with his independence "from crude matter". In fact, all these gentlemen display a remarkable delicacy of feeling. Everything shocks them, especially matter; they complain everywhere of crudity. Earlier we have already had a "*crude* antithesis", now we have "the *most brutal* relationship" of "dependence on *crude* matter".

With gaping jaws the German cries:

Too crude love must not be

Or you'll get an infirmity.

[Modified quotation from Heine's poem "Sie sassen und tranken am Teetisch..." in Lyrisches Intermezzo. The first line of Heine's poem reads: With gaping jaws the canon cries]

German philosophy in its socialist disguise appears, of course, to investigate "crude reality", but it always keeps at a respectable distance and, in hysterical irritation, cries: *noli me tangere*!' [touch me not! — John 20:17]

After these scientific objections to French communism, we come to several historical arguments, which brilliantly demonstrate the "free moral activity" and the "scientific investigation" of our true socialist and his independence of crude matter.

On page 170 he arrives at the "result" that the only communism which "exists" is "*crude* French communism" (crude once again). The construction of this truth a priori is carried out with great "social instinct" and shows that "man has become conscious of his essence". Listen to this:

"There is no other communism, for what Weitling has produced is only an elaboration of Fourierist and communist ideas with which he became acquainted in Paris and Geneva."

"There is no" English communism, "for what Weitling", etc. Thomas More, the Levellers,[2] Owen, Thompson, Watts, Holyoake, Harney, Morgan, Southwell, Goodwyn Barmby, Greaves, Edmonds, Hobson, Spence will be amazed, or turn in their graves, when they hear that they are no communists "for" Weitling went to Paris and Geneva. Moreover, Weitling's communism does seem to be different in kind from the "crude French" variety, in vulgar parlance, from Babouvism, since it contains some of "Fourier's ideas" as well.

"The communists were particularly good at drawing up systems or even complete social orders (Cabet's Icarie, La Félicité, Weitling). All systems are, however, dogmatic and dictatorial" (p. 170).

By this verdict on systems in general true socialism has, of course, saved itself the trouble of acquainting itself at first hand with the communist systems. With one blow it has overthrown not only *Icarie* but also every philosophical system from Aristotle to Hegel, the *Système de la nature* [Paul Henri Holbach], the botanical systems of Linné and Jussieu and even the solar system. Incidentally, as to the systems themselves they nearly all appeared in the early days of the communist movement and had at that time propaganda value as popular novels, which corresponded perfectly to the still undeveloped consciousness of the proletarians, who were then just beginning to play an active part. Cabet himself calls his *Icarie* a "roman philosophique" and he should on no account be judged by his system but rather by his polemical writings, in fact his whole activity as a party leader. In some of these novels, e.g., Fourier's system, there is a vein of true poetry; others, like the systems of Owen and Cabet, show not a shred of imagination and are written in a business-like calculating way or else with an eye to the views of the class to be influenced, in sly lawyer fashion. As the party develops, these systems lose all importance and are at best retained purely nominally as catchwords. Who in France believes in Icarie, who in England believes in the plans of Owen, which he preached in various modifications with an eye to propaganda among particular classes or with respect to the altered circumstances of the moment? Fourier's orthodox disciples of the *Démocratie pacifique* show most clearly how little the real content of these systems lies in their systematic form; they are, for all their orthodoxy, doctrinaire bourgeois, the very antipodes of Fourier. All epoch-making systems have as their real content the needs of the time in which they arose. Each one of them is based on the whole of the antecedent development of a nation, on the historical growth of its class relations with their political, moral, philosophical and other consequences. The assertion that all systems are dogmatic and dictatorial gets us nowhere with regard to this basis and this content of the communist systems. Unlike the English and the French, the Germans did not encounter fully developed class relations. The German communists could, therefore, only base their system on the relations of the class from which they sprang. It is, therefore, perfectly natural that the only existing German communist system should be a reproduction of French ideas in terms of a mental outlook which was limited by the petty circumstances of the artisan.

"The *madness* of Cabet, who insists that everybody should subscribe to *his Populaire*", p. 168, is proof of the tyranny that persists within communism. If our friend first distorts the claims which a party leader makes on his party, impelled by particular circumstances and the danger of failing to concentrate limited financial means, and then evaluates them in terms of the "essence of man", he is indeed bound to conclude that this party leader and all other party members are "mad" whereas purely disinterested figures, like himself and the "essence of man", are of sound intellect. But let him find out the true state of affairs from Cabet's *Ma ligne droite.*

The whole antithesis of our author, and of German true socialists and ideologists in general, to the real movements of other nations is finally epitomised in one classic sentence. The Germans judge everything *sub specie aeterni* [from the standpoint of eternity — cf. Spinoza, Ethics] (in terms of the essence of Man), foreigners view everything practically, in terms of actually existing men and circumstances. The thoughts and actions of the foreigner are concerned with *temporariness*, the thoughts and actions of the German with *eternity.* Our true socialist confesses this as follows:

"The very name of communism, the contrary of competition, reveals its one-sidedness., but is this bias, which may very well have value now as a party name, to last for ever?"

After having thus thoroughly disposed of communism, the writer proceeds to its contrary, *socialism.*

"Socialism establishes that anarchic system which is an essential characteristic of the human race and the universe" (p. 170) and for that very reason has hitherto never existed for "the human race".

Free competition is too "crude" to be regarded by our true socialist as an "anarchic system".

"Relying entirely on the moral core of mankind, socialism" decrees that "the union of the sexes is and should be merely the highest intensification of love; for only what is natural is true and what is true is moral" (p. 171).

The reason why "the union, etc., etc. is and should be," can be applied to everything. For example, "socialism, relying entirely on the *moral core*" of the apes, might just as well decree that the masturbation which occurs naturally among them "is, and should be, merely the highest intensification of" self- "love; *for* only what is natural is true and what is true is moral". It would be hard to say by what standard socialism judges what is natural".

"Activity and enjoyment coincide in the peculiar nature of man; they are determined by this and not by the products external to us."

"But since these products are indispensable for activity, that is to say, for true life, and since by reason of the common activity of mankind as a whole they have, so to speak, detached themselves from mankind, they are or should be the common substratum of further development for all (community of goods)."

"Our present-day society has indeed relapsed into savagery to such an extent that some individuals fall upon the products of another's labour with beastly voracity and at the same time they indolently allow their own essence to decay (rentiers); as a necessary consequence, others are driven to mechanical labour; their property (their own human essence) has been stunted, not by idleness, but by exhausting exertion (proletarians).... The two extremes of our society, rentiers and proletarians, are, however, at the same stage of development. Both are dependent upon things external to them" or are "Negroes", as Saint Max would say (pp. 169, 170).

The "results" reached above by our "Mongol" concerning "our Negroism" are the most perfect achievements which true socialism has, "so to speak, detached from itself, as a product indispensable for true life"; our Mongol, by reason of "the peculiar nature of man", believes that "mankind as a whole" is bound to "fall upon" them with "beastly voracity".

The four concepts — “rentiers”, “proletarians”, “mechanical” and community of goods” — are for our Mongol at any rate “products external to him”; as far as they are concerned, his “activity” and his “enjoyment” consist in representing them simply as anticipated terms for the results of his own “mechanical labour”.

Society, we learn, has relapsed into savagery and consequently the individuals who form this very society suffer from all kinds of infirmities. Society is abstracted from these individuals, it is made independent, it relapses into savagery on its own, and the individuals suffer only as a *result* of this relapse. The expressions — beast of prey, idler and possessor of “one’s own decaying essence” — are the first result of this relapse; whereupon we learn to our horror that these expressions define the “rentier”. The only comment necessary is that this “allowing one’s own essence to decay” is nothing but a philosophically mystified manner of speaking used in an endeavour to comprehend “idleness”, the actual character of which seems to be very little known.

The two expressions, “stunted growth of their own human essence as a result of exhausting exertion” and “being driven to mechanical labour”, are the second “necessary consequence” of the first result of the relapse into savagery. These two expressions are a “necessary consequence of the fact that the rentiers allow their own essence to decay”, and are known in vulgar parlance, we learn, once more to our horror, as “proletarians”.

The sentence, therefore, contains the following sequence of cause and effect: It is a fact that proletarians exist and that they work mechanically. Why are proletarians driven to “mechanical labour"? Because the rentiers “allow their own essence to decay”. Why is it that the rentiers allow their own essence to decay? Because “our present-day society has relapsed into savagery to such an extent”. Why has it relapsed into savagery? Ask thy Maker.

It is characteristic of our true socialist that he sees “the extremes of our society” in the opposition of rentiers and proletarians. This opposition has pretty well been present at all fairly advanced stages of society and has been belaboured by all moralists since time immemorial; it was resurrected right at the beginning of the proletarian movement, at a time when the proletariat still had interests in common with the industrial and petty bourgeoisie. Compare, for example, the writings of Cobbett and P. L. Courier or Saint-Simon, who originally numbered the industrial capitalists among the *travailleurs* as opposed to the *oisiffs* [idlers], the rentiers. Stating this trivial antithesis, which moreover it expresses, not in ordinary language, but in the sacred language of philosophy, presenting this childish discovery, in abstract, sanctified and quite inappropriate terms — this is what here, as in all other cases, the thoroughness of that German science which has been perfected by true socialism amounts to. The conclusion puts the finishing touch to this kind of thoroughness. Our true socialist here merges the totally dissimilar stages of development of the proletarians and the rentiers into “one stage of development”, because he ignores their real stages of development and subsumes them under the philosophic phrase:

"dependence upon things external to them". True socialism has here discovered the stage of development at which the dissimilarity of all the stages of development in the three realms of nature, in geology and history, vanishes into thin air.

Although he detests "dependence upon things external to him", our true socialist nevertheless admits that he is dependent upon them, "since products", i.e., these very things, "are indispensable for activity" and for "true life". He makes this shamefaced admission so that he can clear the road for a philosophical construction of the community of goods — a construction that lapses into pure nonsense so that we need merely draw the reader's attention to it.

We now come to the first of the passages quoted above. Here again, "independence from things" is claimed in respect of activity and enjoyment. Activity and enjoyment "are determined" by "the peculiar nature of man". Instead of tracing this peculiar nature ' in the activity and enjoyment of the men who surround him — in which case he would very soon have found how far the products external to us have a voice in the matter, too — he makes activity and enjoyment "coincide in the peculiar nature of man". Instead of visualising the peculiar nature of men in their activity and their manner of enjoyment, which is conditioned by their activity, he explains both by invoking "the peculiar nature of man", which cuts short any further discussion. He abandons the real behaviour of the individual and again takes refuge in his indescribable, inaccessible, peculiar nature. We see here, moreover, what the *true socialists* understand by "free activity". Our author imprudently reveals to us that free activity is activity which "is not determined by things external to us", i.e., *actus purus*, pure, absolute activity, which is nothing but activity and is in the last instance tantamount to the illusion of "pure thought". It naturally sullies the purity of this activity if it has a material basis and a material result; the true socialist deals only reluctantly with impure activity of this kind; he despises its product, which he terms "a mere refuse of man", and not "a result" (p. 169). The subject from whom this pure activity proceeds cannot, therefore, be a real sentient human being; it can only be the thinking mind. This "free activity", thus translated into German, is nothing but the foregoing "unconditional, unqualified freedom" expressed in a different way. Incidentally, that this talk of "free activity", which merely serves the true socialists to conceal their ignorance of real production, amounts in the final analysis to "pure thought" is also shown by the fact that the writer gives us as his last word the postulate of true cognition.

"This separation of the two principal parties of this age" (namely, French crude communism and German socialism) "is a result of the developments of the last two years, which started more particularly, with Hess' Philosophie der That, in Herwegh's Einundzwanzig Bogen. Consequently it was high time to throw a little more light on the shibboleths of the social parties" (p. 173).

Here we have, on the one hand, the actually existing communist party in France with its literature and, on the other, a few German pseudo-scholars who are trying to comprehend the ideas of this literature philosophically. The latter are treated just as much as the former as a "*principal party* of this *age*", as a party, that is to say, of infinite importance not only to its immediate antithesis, the French communists, but also to the English Chartists and communists, the American national reformers[3] and indeed to every other party "of this age". It is unfortunate that none of these know of the existence of this "principal party". But it has for a considerable time been the fashion among German ideologists for each literary faction, particularly the one that thinks itself "most advanced", to proclaim itself not merely "one of the principal parties", but actually "the principal party of this age". We have among others, "the principal party" of critical criticism, the "principal party" of egoism in agreement with itself and now the "principal party" of the true socialists. In this fashion Germany can boast a whole horde of "principal parties", whose existence is known only in Germany and even there only among the small set of scholars, pseudo-scholars and literati. They all imagine that they are weaving the web of world history when, as a matter of fact, they are merely spinning the long yarn of their own imaginings.

This "principal party" of the true socialists is "a result of the developments of the last two years, which started more particularly with Hess' *Philosophie*". It is "a result", that is to say, of the developments "of the last two years" when our author first got entangled in socialism and found it was "high time" to *enlighten* himself "a little more", by means of a few "shibboleths", on what he considers to be "social parties".

Having thus dismissed communism and socialism, our author introduces us to the higher unity of the two, to *humanism.* Now we are entering the domain of "Man" and the entire true history of our true socialist will be enacted in Germany alone.

"All quibbles about names are resolved in humanism; wherefore communists, wherefore socialists', We are human beings" (p. 172) — tous frères, tous amis.

Swim not, brothers, against the stream,

That's only a useless thing!

Let us climb up on to Templow hill

And cry: God save the King!

[From Heine's poem "Verkehrte Welt" in his verse cycle Zeitgedichte]

Wherefore human beings, wherefore beasts, wherefore plants, wherefore stones? We are bodies!

There follows an historical discourse which is based upon German science and which "will one day help to replace the social instinct" of the French. Antiquity — naïveté, the Middle Ages — Romanticism, the Modern Age — Humanism. By means of these three trivialities, the writer has, of course, constructed his humanism historically and showed it to be the truth of the old *Humaniora*.[4] Compare "Saint Max" in the first volume for constructions of this kind; he manufactures such wares in a much more artistic and less amateurish way.

On page 172 we are informed that

"the final result of scholasticism is that cleavage of life which was abolished by Hess".

Here then, the cause of the "cleavage of life" is shown to be theory. It is difficult to see why these true socialists mention society at all if they believe with the philosophers that all real cleavages are caused by *conceptual cleavages*. On the basis of this philosophical belief in the power of concepts to make or destroy the world, they can likewise imagine that some individual "abolished the cleavage of life" by "abolishing" concepts in some way or other. Like all German ideologists, the true socialists continually mix up literary history and real history as equipotential. This habit is, of course, very understandable among the Germans, who conceal the abject part they have played and continue to play in real history by equating the illusions, in which they are so rich, with reality. And now to the "last two years", during which German science has so thoroughly disposed of all problems that nothing remains to the other nations but to carry out its decrees.

"Feuerbach only partially completed, or rather only began, the task of anthropology, the regaining by man of his estranged essence" (the essence of man or the essence of Feuerbach?); "he destroyed the religious illusion, the theoretical abstraction, the God-Man, whereas Hess annihilates the political illusion, the abstraction of his ability [Vermögen], of his activity" (does this refer to Hess or to man?), "that is, he annihilates wealth. It was the work of Hess which freed man from the last of the forces external to him, and made him capable of moral activity — for all the unselfishness of earlier times" (before Hess) "was only an illusory unselfishness — and raised him once more to his former dignity; for was man ever previously" (before Hess) "esteemed for what he actually was? Was he not judged by what he possessed? He was esteemed for his money" (p. 171).

It is characteristic of all these high-sounding phrases about liberation, etc., that it is always "man" who is liberated. Although it would appear from the pronouncements made above that "wealth", "money", and so on, have ceased to exist, we nevertheless learn in the following sentence:

"Now that these illusions" (money, viewed sub specie aeterni, is, indeed, an illusion, 1'or n'est qu'une chimère [Gold is but a chimera. From Giacomo Meyerbeer's opera Robert le Diable]) "have been destroyed, we can think about a new, human order of society" (ibid.).

But this is quite superfluous since

"the recognition of the essence of man has as a necessary and natural result a life which "is truly human" (p. 172).

To arrive at communism or socialism by way of metaphysics or politics, etc., etc. — these phrases beloved of true socialists merely indicate that such and such a writer has adopted communist ideas (which have reached him from without and have arisen in circumstances quite different from his) translating them into the mode of expression corresponding to his former standpoint, and formulating them in accordance with this standpoint. Which of these points of view is predominant in a nation, whether its communist outlook has a political or metaphysical or any other tinge depends, of course, upon the whole development of the nation. The fact that the attitude of most French communists has a political complexion — this is, on the other hand, countered by the fact that very many French socialists have abstracted completely from politics — causes our author to infer that the French "have arrived at communism by way of politics", by way of their political development. This proposition, which has a very wide circulation In Germany, does not imply that the writer has any knowledge either of politics, particularly of French political developments, or of communism; it only shows that he considers politics to be an independent sphere of activity, which develops in its own independent way, a belief he shares with all ideologists.

Another catchword of the true socialists is "true property", "true, personal property", "real", "social", "living", "natural", etc., etc., property, whereas it is very typical that they refer to private property as *"so-called* property". The Saint-Simonists were the first to adopt this manner of speaking, as we have already pointed out in the first volume; but they never lent it this German metaphysical-mysterious form; it was with them at the beginning of the socialist movement to some extent justified as a counter to the stupid clamour of the bourgeoisie. The end to which most of the Saint-Simonists came shows at any rate the ease with which this "true property" is again resolved into "ordinary private property".

If one takes the antithesis of communism to the world of private property in its crudest form, i.e., in the most abstract form in which the real conditions of that antithesis are ignored, then one is faced with the antithesis of property and lack of property. The abolition of this antithesis can be viewed as the abolition of either the one side or the other; either property is abolished, in which case universal lack of property or destitution results, or else the lack of property is abolished, which means the establishment of true property. In reality, the actual property-owners stand on one side and the propertyless communist proletarians on the other. This opposition becomes keener day by day and is rapidly driving to a crisis. If, then, the theoretical representatives of the proletariat wish their literary activity to have any practical effect, they must first and foremost insist that all phrases are dropped which tend to dim the realisation of the sharpness of this opposition, all phrases which tend to conceal this opposition and may even give the bourgeois a chance to approach the communists for safety's sake on the strength of their philanthropic enthusiasms. All these bad qualities are, however, to he found in the catchwords of the true socialists and particularly in "true property". Of course, we realise that the communist movement cannot be impaired by a few German phrase-mongers. But in a country like Germany — where philosophic phrases have for centuries exerted a certain power, and where, moreover, communist consciousness is anyhow less keen and determined because class contradictions do not exist in as acute a form as in other nations — it is, nevertheless, necessary to resist all phrases which obscure and dilute still further the realisation that communism is totally opposed to the existing world order.

This theory of true property conceives real private property, as it has hitherto existed, merely as a semblance, whereas it views the concept abstracted from this real property as the truth and reality of the semblance; it is therefore ideological all through. All it does is to give clearer and more precise expression to the ideas of the petty bourgeois; for their benevolent endeavours and pious wishes aim likewise at the abolition of the lack of property.

In this essay we have had yet further evidence of the narrowly national outlook which underlies the alleged universalism and cosmopolitanism of the Germans.

The land belongs to the Russians and French,
The English own the sea.
But we in the airy realm of dreams
Hold sovereign mastery.

Our unity is perfect here,
Our power beyond dispute;
The other folk in solid earth
Have meanwhile taken root.
[Heinrich Heine, Deutschland, ein Wintermärchen]

With infinite self-confidence the Germans confront the other peoples with this airy realm of dreams, the realm of the "essence of man", claiming that it is the consummation and the goal of all world history; in every sphere they regard their dreamy fantasies as a final verdict on the actions of other nations; and because everywhere their lot is merely to look on and be left high and dry they believe themselves called upon to sit in judgment on the whole world while history attains its ultimate purpose in Germany. We have already observed several times that the complement of this inflated and extravagant national pride is practical activity of the pettiest kind, worthy of shopkeepers and artisans. National narrow-mindedness is everywhere repellent. In Germany it is positively odious, since, together with the illusion that the Germans are superior to nationality and to all real interests, it is held in the face of those nations which openly confess their national limitations and their dependence upon real interests. It is, incidentally, true of every nation that obstinate nationalism is now to be found only among the bourgeoisie and their writers.

B. “Socialistische Bausteine"

["Cornerstones of Socialism” — title of an article by Rudolph Matthäi]

Rheinische Jahrbücher, p. 155 et seq.

In this essay the reader is first of all prepared for the more difficult truths of true socialism by a belletristic and poetic prologue. The prologue opens by proclaiming “happiness” to be the “ultimate goal of all endeavour, all movements, of all the arduous and untiring exertions of past millenniums”. In a few brief strokes, so to speak, a history of the struggle for happiness is sketched for us:

“When the foundations of the old world crumbled, the human heart with all its yearning took refuge in the other world, to which it transferred its happiness” (p. 156).

Hence all the bad luck of the terrestrial world. In recent times man has bidden farewell to the other world and our true socialist now asks:

“Can man greet the earth once more as the land of his happiness? Does he once more recognise earth as his original home? Why then should he still keep life and happiness apart? Why does he not break down the last barrier which cleaves earthly life into two hostile halves’,” (ibid.).

“Land of my most blissful feelings!” etc. He now invites “Man” to take a walk, an invitation which “Man” readily accepts. “Man” enters the realm of “free nature” and utters, among other things, the following tender effusions of a true socialist’s heart [from title of Wilhelm Wackenroder’s book Herzensergiessungen eines kunstliebenden Klosterbruders]:

“.!. gay flowers ... tall and stately oaks ... their satisfaction, their happiness lie in their life, their growth and their blossoming ... an infinite multitude of tiny creatures in the meadows ... forest birds ... a mettlesome troop of young horses ... I see” (says “man”) “that these creatures neither know nor desire any other happiness than that which lies for them in the expression and the enjoyment of their lives. When night falls, my eyes behold a countless host of worlds which revolve about each other in infinite space according to eternal laws. I see in their revolutions a unity of life, movement and happiness” (p. 157).

“Man” could also observe a great many other things in nature, e.g., the bitterest competition among plants and animals; he could see, for example, in the plant world, in his “forest of tall and stately oaks”, how these tall and stately capitalists consume the nutriment of the tiny shrubs, which might well complain*: terra, aqua, aere et igni interdicti sumus* [we are banned from earth, water air and fire] ; he could observe the parasitic plants, the ideologists of the vegetable world, he could further observe that there is open warfare between the “forest birds” and the “Infinite multitude of tiny creatures”, between the grass of his “meadows” and the “mettlesome troop of young horses”. He could see in his “countless host of worlds” a whole heavenly feudal monarchy complete with tenants and satellites, a few of which, e.g., the moon, lead a very poor *life aere et aqua interdicti;* a feudal system in which even the homeless vagabonds, the comets, have been apportioned their station in life and in which, for example, the shattered asteroids bear witness to occasional unpleasant scenes, while the meteors, those fallen angels, creep shamefaced through the "Infinite space", until they find somewhere or other a modest lodging. In the further distance, he would come upon the reactionary fixed stars.

"All these beings find their happiness, the satisfaction and the enjoyment of their life in the exercise and manifestation of the vital energies with which nature has endowed them."

That is, "man" considers that in the interaction of natural bodies and the manifestation of their forces these natural bodies find their happiness, etc. "Man" is now reproached by our true socialist with his discord:

"Did not man too spring from the primeval world, is he not a child of nature, like all other creatures? Is he not formed of the same materials, is he not endowed with the same general energies and properties that animate all thin ? Why does he still seek his earthly happiness in an earthly beyond?" (p. 158).

"*The same* general energies and properties" which man has in common with "*all* things", are cohesion, impenetrability, volume, gravity, etc., which can be found set out in detail on the first page of any textbook of physics. It is difficult to see how one can construe this as a reason why man should not "seek his happiness in an earthly beyond". However, he admonishes man as follows:

"Consider the lilies of the field."

Yes, consider the lilies of the field, how they are eaten by goats, transplanted by "man" into his buttonhole, how they are crushed beneath the immodest embraces of the dairymaid and the donkey-driver!

"Consider the lilies of the field, they toil not, neither do they spin: and thy Heavenly Father feedeth them." [cf. Matthew 6: 28, 26]

Go thou and do likewise! After learning in this fashion of the unity of "man" with "all things", we now learn how he *differs* from "all things".

"But man knows himself, he is conscious of himself. Whereas in other beings, the instincts and forces of nature manifest themselves in isolation and unconsciously, they are united in man and become conscious ... his nature is the mirror of all nature, which recognises itself in him. Well then! If nature recognises itself in me, then I recognise myself in nature. I see in its life my own life [...]. We are thus giving living expression to that with which nature has imbued us" (p. 158).

This whole prologue is a model of ingenuous philosophic mystification. The true socialist proceeds from the thought that the dichotomy of life and happiness must cease. To prove this thesis he summons the aid of nature presupposing that this dichotomy does not exist in nature and from this he deduces that since man, too, is a natural body and has the properties which such bodies generally possess, this dichotomy ought not to exist for him either. Hobbes had much better reasons for invoking nature as a proof of his *bellum omnium contra omnes* [Hobbes, De Cive] and Hegel, on whose construction our true socialist depends, for perceiving in nature the cleavage, the slovenly period of the Absolute Idea, and even calling the animal the concrete anguish of God. After shrouding nature in mystery, our true socialist shrouds human consciousness in mystery too, by making it the "mirror" of this mystified nature. Of course, when the manifestation of consciousness ascribes to *nature* the mental expression of a pious wish about human affairs, it is self-evident that consciousness will only be the mirror in which nature contemplates itself. That "man" has to abolish in his own sphere the cleavage, which is assumed to be non-existent in nature, is now proved by reference to man in his quality as a mere passive mirror in which nature becomes aware of itself; just as it was earlier proved by reference to man as a mere natural body. But let us inspect the last proposition more closely; all the nonsense of these arguments is concentrated in it.

The first fact asserted is that man possesses self-consciousness. The instincts and energies of individual natural beings are transformed into the instincts and forces of "Nature", which then, as a matter of course, "are manifested" in *isolation in* these individual beings. This mystification was needed in order later to effect a unification of these instincts and forces of "Nature" in the human self-consciousness. Thereby the self-consciousness of man is, of course, transformed into the self-consciousness of nature within him. This mystification is apparently resolved in the following way: in order to pay nature back for finding its self-consciousness in man, man seeks his, in turn, in nature — a procedure which enables him, of course, to find nothing in nature except what he has imputed to it by means of the mystification described above.

He has now arrived safely at the point from which he originally started, and this way of turning round on one's heel is now called in Germany — *development.*

After this prologue comes the real exposition of true socialism.

First Cornerstone

Page 160: "Saint-Simon said to his disciples on his death-bed: 'My whole life can be expressed in one thought: all men must be assured the freest development of their natural capacities.' Saint-Simon was a herald of socialism."

This statement is now treated according to the true socialist method described above and combined with that mystification of nature which we saw in the prologue.

"Nature as the basis of all life is a unity which proceeds from itself and returns to itself, which embraces the immense multifariousness of its phenomena and apart from which nothing exists" (p. 158).

We have seen how one contrives to transform the different natural bodies and their mutual relationships into multifarious "phenomena" of the secret essence of this mysterious "unity". The only new element in this sentence is that nature is first called "the *basis* of all life", and immediately afterwards we are informed that "apart from it nothing exists"; according to this it embraces "life" as well and cannot merely be its *basis*. After these portentous words, there follows the pivotal point of the whole essay:

"Every one of these phenomena, every individual life, exists and develops only through its antithesis, its struggle with the external world, and it is based upon its interaction with the totality of life, with which it is in turn by its nature linked in a whole, the organic unity of the universe" (pp. 158, 159).

This pivotal sentence is further elucidated as follows:

"The individual life finds, on the one hand, its foundation, its source and its subsistence in the totality of life; on the other hand, the totality of life in continual struggle with the individual life strives to consume and to absorb it" (p, 159).

Since this statement applies to every individual life, "therefore", it can be, and is, applied to men as well:

"Man can therefore only develop in and through the totality of life" (No. 1, ibid.).

Conscious individual life is now contrasted with unconscious individual life; human society with natural life in general; and then the sentence which we quoted last is repeated in the following form:

"By reason of my nature, it is only in and through community with other men that I can develop, achieve self-conscious enjoyment of my life and attain happiness" (No. II, ibid.).

This development of the individual in society is now discussed in the same way as "individual life" in general was treated above:

"In society, too, the opposition of individual life and life in general becomes the condition of conscious human development. It is through perpetual struggle, through perpetual reaction against society, which confronts me as a restricting

force, that I achieve self-determination and freedom, without which there is no happiness. My life is a continuous process of liberation, a continuous battle with and victory over the conscious and unconscious external world, in order to subdue it and use it to enjoy my life. The instinct of self-preservation, the striving for my own happiness, freedom and satisfaction, these are consequently natural, i.e., reasonable, expressions of life" (ibid.).

Further:

"I demand, therefore, from society that it should afford me the possibility of winning from it my satisfaction, my happiness, that it should provide a battlefield for his bellicose spirit. just as the individual plant demands soil, warmth and sun, air and rail) for its growth, so that it may bear leaves, blossoms and fruit, man too desires to find it] society the conditions for the all-round development and satisfaction of all his needs, inclinations and capacities. It must offer him the possibility of winning his happiness. How he will use that chance, what he will make of himself, of his life, depends upon him, upon his individuality. I alone can determine my happiness" (pp. 159, 160).

There follows, as the conclusion of the whole argument, the statement by Saint-Simon which is quoted at the beginning of this section. The Frenchman's idea has thus been vindicated by German science. What does this vindication consist in?

The true socialist has already earlier imputed various Ideas to nature which he would like to see realised in human society. While formerly it was the individual human being, whom he made the mirror of nature, it is now society as a whole. A further conclusion can now be drawn about human society from the ideas imputed to nature. Since the author does not discuss the historical development of society, contenting himself with this meagre analogy, it remains incomprehensible why society should not always have been a true image of nature. The phrases about society, which confronts the individual in the shape of a restricting force, etc., are therefore relevant to every form of society. it is quite natural that a few inconsistencies should have crept into this interpretation of society. Thus he must now admit that a *struggle* is waged in nature, ill contrast to the harmony described in the prologue. Society, the totality of life", is conceived by our author riot as the interaction of the constituent Individual lives", but as a distinct existence, and this moreover separately interacts with these "individual lives". If there is any reference to real affairs in all this it is the illusion of the independence of the state in relation to private life and the belief in this apparent independence as something absolute. But as a matter of fact, neither here nor anywhere in the whole essay is it a question of nature and society at all; it is merely a question of the two categories, individuality and universality, which are given various names and which are said to form a contradiction, the reconciliation of which would be highly desirable.

From the vindication of "individual life" as opposed to the "totality of life" it follows that the satisfaction of needs, the development of capacities, self-love, etc., are "natural, reasonable expressions of life". From the conception of society as an image of nature, it follows that in all forms of society existing up to now, the present included, these expressions of life have attained full maturity and are recognised as justified.

But we suddenly learn on page 159 that "in our present-day society" these reasonable, natural expressions of life are nevertheless "so often repressed" and "usually only for that reason do they degenerate into an unnaturalness, malformation, egoism, vice, etc."

And so, since society does not, after all, correspond to its prototype. nature, the true socialist "demands" that it should conform to nature and justifies his claim by adducing the plant as an example — a most unfortunate example. In the first place, the plant does not "demand" of nature all the conditions of existence enumerated above; unless it finds them already present it never becomes a plant at all; it remains a grain of seed. Moreover, the state of the "leaves, blossoms and fruit" depends to a great extent on the "soil", the "warmth" and so on, the climatic and geological conditions of its growth. Far from "demanding" anything, the plant is seen to depend utterly upon the actual conditions of existence; nevertheless, it is upon this alleged demand that our true socialist bases his own claim for a form of society which shall conform to his individual "peculiarity". The demand for a true socialist society is based on the imaginary demand of a coconut palm that the "totality of life" should furnish it with "soil, warmth, sun, air and rain" at the North Pole.

This claim of the individual on society is not deduced from the real development of society but from the alleged relationship of the metaphysical characters — individuality, and universality. You have only to interpret single individuals as representatives, embodiments of individuality, and society as the embodiment of universality, and the whole trick is done. And at the same time Saint-Simon's .statement about the free development of the capacities has been correctly expressed and placed upon its true foundation. This correct expression consists in the absurd statement that the individuals forming society want to preserve their "peculiarity", want to remain as they are, while they demand of society a transformation which can only proceed from a transformation of *themselves.*

Second Cornerstone

“You've forgotten the rest of the charming refrain?
Well, just give it up and start over again!

“Infinite in their variety, all individual...
Beings as unity taken together are ‘World Organism” (p. 160).

And so we find ourselves thrown back again to the beginning of the essay and have to go through the whole comedy of individual life and totality of life for the second time. Once more we are initiated into the deep mystery of the interaction of these two lives, *restauré a neuf* by the introduction of the new term “*polar relationship’* and the transformation of the individual life into a mere *symbol*, an “*image*” of the totality of life. Like a kaleidoscopic picture this essay is composed of reflections of itself, a method of argument common to all true socialists. Their approach to their arguments is similar to that of the cherry-seller who was selling her wares below cost price, working on the correct economic principle that it is the *quantity* sold that matters. As regards true socialism, this is the more essential because its cherries were rotten before they were ripe.

A few examples of this self-reflection follow:

Cornerstone No. I, pp. 158, 159.	**Cornerstone No. II, pp. 160, 161.**
“*Every individual life exists and develops only through its antithesis* ... is based upon its *interaction* with the *totality of life,*	“*Every individual life exists and develops in and through the totality of life;* the totality of life only exists and develops in and through the individual life.” (Interaction.)
“With which it is in turn, by its nature, linked in a *whole.*	“The individual life develops ... as a *part* of life in general.
“Organic unity of the universe.	“The world organism is combined unity.
“The individual life finds, on the one hand, its *foundation*, its source and its *subsistence* in the totality of life,	“Which” (the totality of life) “becomes the *soil* and *substance* of its” (the individual life’s) “development ... that each is *founded* upon the other....
“On the other hand, the totality of life in continual *struggle* with the individual life strives to consume it.	“That they *struggle* against one another and oppose one another.
“*Therefore* (p. 159):	“*It follows* (p. 161):
“Human society is to *conscious* ... life what unconscious universal life in general is to the unconscious individual life.	“That *conscious individual life* is also conditioned by the conscious totality of life and” ... (vice versa).

"*I* can only *develop in and through community* with other men.... In society, coo, the opposition of *individual life* and life in general becomes", etc....	"*The individual human being develops only in and through society,* society", vice versa, etc....
"Nature ... is a *unity*... which *embraces* the immense *multifariousness* of its phenomena."	"Society is a *unity* which embraces and *comprises* the *multifariousness* of individual human development."

But our author is not satisfied with this kaleidoscopic display. He goes on to repeat his artless remarks about individuality and universality in yet another form. He first puts forward these few and abstractions as absolute principles and then concludes that the same relationship must recur in the real world. Even this gives him the chance of saying everything twice under the guise of making deductions, in abstract form and, when he is drawing his conclusion, in seemingly concrete form. Then, however, he sets about varying the concrete *names* which he has given to his two categories. Universality appears variously as nature, unconscious totality of life, conscious ditto, life in general, world organism, all-embracing unity, human society, community, organic unity of the universe, universal happiness, common weal, etc., and individuality appears under the corresponding names of unconscious and conscious individual life, individual happiness, one's own welfare, etc. In connection with each of these names we are obliged to listen to the selfsame phrases which have already been applied often enough to individuality and universality. The second cornerstone contains, therefore, nothing which was not already contained in the first. But since the words *égalité, solidarité, unité des intérêts* are used by the French socialists, our author attempts to fashion them into "cornerstones" of true socialism by turning them into German.

"As a conscious member of society I recognise every other member as a being different from myself, confronting me and at the same time supported by and derived from the primary common basis of existence and equal to me. I recognise every one of my fellow-men as opposed to me by reason of his particular nature, yet equal to me by reason of his general nature. The recognition of human equality, of the right of every man to existence, depends therefore upon the consciousness that human nature is common to all; in the same way, love, friendship, justice and all the social virtues are based upon the feeling of natural human affinity and unity. If up to now these have been termed obligations and have been imposed upon men, then in a society founded upon the consciousness of man's inward nature, i.e., upon reason and not upon external compulsion, they will become free, natural expressions of life. In society which conforms to nature, i.e., to reason, the conditions of existence must accordingly be equal for all its members, i.e., must be general" (pp. 161, 162).

The author displays a marked ability for first putting forward a proposition in assertive fashion and then legitimising it as a consequence of itself by inserting an *accordingly*, a *consequently*, etc. He is equally skilful at incidentally smuggling into his peculiar deductions traditional socialistic statements by the use of "if they have", "if it is" — "then they must", "then it will become", etc.

In the first cornerstone, we saw, on the one hand, the individual and, on the other, universality which confronted him as society. This antithesis now reappears in another form, the individual now being divided within himself into a particular and a *general* nature. From the general nature of the individual, conclusions are drawn about "human equality" and community. Those conditions of life which are common to men thus appear here as a product of "the essence of man", of *nature*, whereas they, just as much as the consciousness of equality, are historical products. Not content with this, the author substantiates this equality by stating that it rests entirely "on the primary common basis of existence". We learned in the prologue, p. 158, that man "is formed of the same materials and is endowed with the same general energies and properties that animate all things". We learned in the first cornerstone that nature is "the basis of all life", and so, the "primary common basis of existence". Our author has, therefore, far outstripped the French since, being "a conscious member of society", he has not only demonstrated the equality of men with one another; he has also demonstrated their equality with every flea, every wisp of straw, every stone.

We should be only too pleased to believe that "all the social virtues" of our true socialist are based "upon the feeling of natural human affinity and unity", even though feudal bondage, slavery and all the social inequalities of every age have also been based upon this "natural affinity". Incidentally, "natural human affinity" is an historical product which is daily changed at the hands of men; it has always been perfectly natural, however inhuman and contrary to nature it may seem, not only in the judgment of "Man", but also of a later revolutionary generation.

We learn further, quite by chance, that present-day society is based upon "external compulsion". By "external compulsion" the true socialists do not understand the restrictive material conditions of life of given individuals. They see it only as the compulsion exercised by the *state,* in the form of bayonets, police and cannons, which far from being the foundation of society, are only a consequence of its structure. This question has already been discussed in *Die heilige Familie* and also in the first volume of this work.

The socialist opposes to present-day society, which is "based upon external compulsion", the ideal of true society, which is based upon the "consciousness of man's *inward* nature, i.e., upon reason". It is based, that is, upon the consciousness of consciousness, upon the thought of thought. The true socialist does not differ from the philosophers even in his choice of terms. He forgets that the "inward nature" of men, as well as their "consciousness" of it, "i.e.", their "reason", has at all times been an historical product and that even when, as he believes, the society of men was based "upon external compulsion", their "inward nature" corresponded to this "external compulsion".

There follow, on page 163, individuality and universality with their usual retinue, in the form of individual and public welfare. You may find similar explanations of their mutual relationship in any handbook of political economy under the heading of competition and also, though better expressed, in Hegel.

For example, *Rheinische Jahrbücher,* p. 163:

"By furthering the public welfare, I further my own welfare, and by furthering my own welfare, I further the public welfare."

Cf. Hegel's *Rechtsphilosophie,* p. 248 (1833):

"In furthering my ends, I further the universal, and this in turn furthers my ends."

Compare also *Rechtsphilosophie,* p. 323 et seq., about the relation of the citizen to the state.

"Therefore, as a final consequence, we have the conscious unity of the individual life with the totality of life, harmony" (Rheinische Jahrbücher, p. 163).

"As a final consequence", that is to say, of

"this polar relationship between the individual and the general life, which consists in the fact that sometimes the two clash and oppose one another, while at other times, the one is the condition and the basis of the other".

The "final consequence" of this is at most the harmony of disharmony with harmony; and all that follows from the constant repetition of these familiar phrases is the author's belief that his fruitless wrestling with the categories of individuality and universality is the appropriate form in which social questions should be solved. The author concludes with the following flourish:

"Organic society has as its basis universal equality and develops, through the opposition of the individuals to the universal, towards unrestricted concord, towards the unit of individual with universal happiness, towards social" (!) "harmony of society," (!!), "which is the reflection of universal harmony" (p. 164).

It is modest, indeed to call this sentence a "cornerstone". It is the primal rock upon which the whole of true socialism is founded.

Third Cornerstone

"Man's struggle with nature is based upon the polar opposition of my particular life to, and its interaction with, the world of nature in general. When this struggle appears as conscious activity, it is termed labour" (p. 164).

Is not, on the contrary, the idea of "polar opposition" based upon the observation of a struggle between men and nature? First of all, an abstraction is made from a fact; then it is declared that the fact is based upon the abstraction. A very cheap method to produce the semblance of being profound and speculative in the German manner.

For example:

Fact: The cat eats the mouse.

Reflection: Cat — nature, mouse — nature, consumption of mouse by cat = consumption of nature by nature = self-consumption of nature.

Philosophic presentation of the fact: Devouring of the mouse by the cat is based upon the self-consumption of nature.

Having thus obscured man's struggle with nature, the writer goes on to obscure man's conscious activity in relation to nature, by describing it as the *manifestation* of this mere abstraction from the real struggle. The profane word *labour* is finally smuggled in as the result of this process of mystification. It is a word which our true socialist has had on the tip of his tongue from the start, but which he dared not utter until he had legitimised it in the appropriate way. Labour is constructed from the mere abstract idea of Man and nature; it is thereby defined in a way which is equally appropriate and inappropriate to all stages in the development of labour.

"Therefore, labour is any conscious activity on the part of man whereby he tries to acquire dominion over nature in an intellectual and material sense, so that he may utilise it for the conscious enjoyment of his life and for his intellectual or bodily satisfaction" (ibid.).

We shall only draw attention to the brilliant deduction:

"When this struggle appears as conscious activity, it is termed labour — therefore labour is any conscious activity on the part of man", etc.

We owe this profound insight to the "polar opposition". The reader will recall Saint-Simon's statement concerning *libre développement de toutes les facultis* [free development of all capacities] mentioned above, and also remember that Fourier wished to see the present *travail répugnant* replaced by *travail attrayant.* [repellent labour" replaced by "attractive labour" — Charles Fourier, Nouveau monde industriel] We owe to the "polar opposition" the following philosophic vindication and explanation of these propositions:

"But since" (the "but" is meant to indicate that there is no connection here) "for life every manifestation, exercise and expression of its forces and faculties should be a source of enjoyment and satisfaction, it follows that labour should itself be a manifestation and development of human capacities and should be a source of enjoyment, satisfaction and happiness. Consequently, labour must itself become a free expression of life and so a source of enjoyment" (ibid.).

Here we are shown what we were promised in the preface to the *Rheinische Jahrbücher,* namely, "how far German social science differs in its development up to the present from French and English social science" and what it means "to present the doctrine of communism in a scientific form".

It would be a lengthy and boring procedure to expose every logical lapse which occurs in the course of these few lines. But let us first consider the offences against *formal logic.*

To prove that labour, an expression of life, should be a source of enjoyment, it is assumed that life should afford enjoyment in all its expressions. From this the conclusion is drawn that life should be a source of enjoyment also in its expression as labour. Not satisfied with this periphrastic transformation of a postulate into a conclusion, the author draws a false conclusion. From the fact that "for life every manifestation should be a source of enjoyment", he deduces that labour, which is one of these manifestations of life, "should itself be a manifestation and development of human capacities", that is to say, of life once again. Hence it ought to be what it already is. How could labour ever be *anything but* a "manifestation of human capacities"? But he does not stop there. *Because* labour *should* be so, it "*must consequently*" be so, or still better: because labour "should be a manifestation and development of human capacities", *it must* consequently become something completely different, namely, "a free expression of life", which did not enter into the question at all before this. And whereas earlier the postulate of labour as enjoyment was directly deduced from the postulate of the enjoyment of life, the former postulate is now put forward as a consequence of the new postulate of "free expression of life in labour".

As far as the *content* of the proposition is concerned, one cannot quite see why labour has not always been what it ought to be, why it must now become what it ought to be, or why it should become something which up to now it was not bound to be. But, of course, up to now the essence of man and the polar opposition of man and nature were not property, explained.

A "scientific vindication" of the communist view about the common ownership of the products of labour follows:

"But" (the recurrent "but" has the same meaning as the previous one) "the product of labour must serve at one and the same time the happiness of the individual, of the labouring individual, and the general happiness. This is

effected by reason of the fact that all social activities are complementary and reciprocal" (ibid.).

This statement is merely a copy of what any political economy has to say in praise of competition and the division of labour; except that the argument has been weakened by the introduction of the word "happiness". Finally, we are given a philosophic vindication of the French organisation of labour:

"Labour as a free activity, which is enjoyable, affords satisfaction and at the same time serves the common weal, is the basis of the organisation of labour" (p. 165).

But since labour *should* and *must* become a free activity "which is enjoyable", etc., and therefore this state of affairs has not yet been *reached,* one would have expected *on the contrary* the organisation of labour to be the basis of "labour as an enjoyable activity". But the *concept* of labour as such an activity is quite sufficient [for the writer].

At the end of the essay the author believes to have reached results".

These "cornerstones" and "results", together with those other granite boulders which are to be found in the *Einundzwanzig Bogen*, the *Bürgerbuch* and the *Neue Anekdota*[5] form the rock upon which true socialism, alias *German social philosophy,* will build its church. [cf. Matthew 16:18]

We shall have occasion to listen to a few of the hymns, a few of the fragments of the *cantique allégorique hébraïque et mystique* [Evariste Parny, La guerre des dieux. Chant premier] Which are chanted in this church.

This chapter was published by Marx separately as a review in the monthly publication Das Westphälische Dampfboot in August and September 1847. Before that, in April 1847, Marx had published a "Declaration against Karl Grün". He stated in it that he intended to publish a review of Grün's book Die soziale Bewegung in Frankreich und Belgien (see MECW, Vol. 6) in the Westphälische Dampfboot. But the first instalment of this article was published only in August 1847. The editors explained in a note that the article could not be published earlier because "for over two months the manuscript was sent from one German town to another without reaching us". The work was published in the Westphälische Dampfboot as Marx's article (the name of the author was mentioned in the editorial note). Consequently one can assume that in contrast to Vol. 1, which was written jointly by Marx and Engels, some chapters of Vol. II of The German Ideology are probably the individual work of one or other of them. But since the manuscript of this chapter of Vol. If is in Engels' handwriting, it is likely that Engels helped to write it. The copy sent to the Westphälische Dampfboot was probably made from this manuscript. The manuscript and the published text are practically identical. Comparatively few changes were made in the text itself and it is possible that some of these were by the editors of the journal. In this volume, variants affecting the meaning are given in footnotes. Where the manuscript is damaged the missing passages have

been taken from the printed text. Such passages have not been specially marked (either by square brackets or footnotes) in this chapter.

IV. Karl Grün: "The Social Movement in France and Belgium" (Darmstadt 1845) Or The Histriography of True Socialism

“In sooth, if it were not a matter of discussing the whole horde of them ... we should probably throw down our pen.... And now, with that same arrogance, it” (Mundt’s Geschichte der Gesellschaft) “appears before a wide circle of readers, before that public which seizes voraciously upon everything displaying the word social because a sure instinct tells it what secrets of future times are hidden in this little word. Hence a double responsibility rests on the writer and he deserves double reproof, if he sets to work inexpertly!”

“We shall not reproach Herr Mundt with not knowing anything of the actual achievements of French and English social literature apart from what Herr L. Stein has revealed to him. When it appeared, Stein’s book was worthy of note.... But to coin phrases nowadays ... about Saint-Simon, to call Bazard and Enfantin the two branches of Saint-Simonism, to follow this up with Fourier and to repeat idle chit-chat about Proudhon, etc.!... And yet we would willingly overlook this if he had only portrayed the genesis of social ideas in a new and original way.”

With this haughty and Rhadamanthine pronouncement Herr Grün begins a review (in the *Neue Anekdota,* pp. 122, 123) of Mundt’s *Geschichte der Gesellschaft.*

The reader will be amazed at the artistic talent shown by Herr Grün, who actually gives, in this guise, a criticism of his own book, which at that time was not yet born.

We observe in Herr Grün a fusion of true socialism with Young-German literary pretensions[1] — a highly diverting spectacle. The book mentioned above is in the form of letters to a lady, from which the reader may surmise that here the profound divinities of true socialism are garlanded with the roses and myrtles of “young literature”. Let us hasten to pluck a few roses:

“The Carmagnole was running through my head ... in any case it is terrible that the Carmagnole should be permitted to take breakfast in the head of a German writer, even if not to take up permanent quarters there” (p. 3).

“If I had old Hegel here, I should collar him: What! So nature is the otherness of mind? What! You dullard!” (p. 11).

"Brussels is to some extent a reproduction of the French Convention; it has its parties of the Mountain and the Valley” (p. 24).

"The Laneburg Heath of politics” (p. 80).

"Gay, poetic, inconsistent, fantastic chrysalis” (p. 82).

"Restoration liberalism, the groundless cactus, which as a parasite coiled round the seats in the Chamber of Deputies" (pp. 87, 88).

That the cactus is neither "groundless", nor a "parasite", and that gay", "poetic" or "inconsistent" "chrysalises" or pupae do not exist, does not detract from these lovely images.

"Amid this sea" (of newspapers and journalists in the Cabinet Montpensier [6]) "I myself, however, feel like a second Noah, despatching his doves to see if he can possibly build a dwelling or plant a vineyard anywhere or come to a reasonable agreement with the infuriated Gods" (p. 259).

No doubt this refers to Herr Grün's activity as a newspaper correspondent.

"Camille Desmoulins was a human being. The Constituent Assembly was composed of philistines. Robespierre was a virtuous magnetiser. Modern history, in a word, is a life-and-death struggle against the shopkeepers and the magnetisers!!!" "Happiness is a plus, but a plus to the nth power" (p. 203).

Hence, happiness = +n , a formula which can only be found in the aesthetic mathematics of Herr Grün.

"Organisation of labour, what is it? And the peoples replied to the Sphinx with the voices of a thousand newspapers.... France sings the strophe, Germany the antistrophe, old mystic Germany" (p. 259).

"North America is even more distasteful to me than the Old World because its shopkeeping egoism has on its cheeks the bloom of impertinent health ... because everything there is so superficial, so rootless, I might almost say so provincial.... You call America the New World; it is the oldest of all Old Worlds; our worn-out clothes set the fashion there" (pp. 101, 324).

So far we were only aware that unworn stockings of German manufacture were worn there; although they are of too poor a quality to set the "fashion".

"The logically stable security-mongering of these institutions" (p. 461).

Unless these flowers your heart delight

To be a "man" you have no right!'

[from Mozart's opera The Magic Flute]

We have deceived the reader. Herr Grün's literary graces are not an embellishment of the science of true socialism, the science is merely the padding between these outbursts of literary gossip, and forms, so to speak, its "social background".

We have deceived the reader. Herr Grün's literary graces are not an embellishment of the science of true socialism, the science is merely the padding between these outbursts of literary gossip, and forms, so to speak, its "social background".

In an essay by Herr Grün, “Feuerbach und die Socialisten”, the following remark occurs *(Deutsches Bürgerbuch,* p. 74):

“When one speaks of Feuerbach one speaks of the entire work of philosophy from Bacon of Verulam up to the present; one defines at the same time the ultimate purpose and meaning of philosophy, one sees man as the final result of world history. To do so is a more reliable, because a more profound, method of approach than to bring up wages, competition, the faultiness of constitutions and systems of government.... We have gained man, man who has divested himself of religion, of moribund thoughts, of all that is foreign to him, with all their counterparts in the practical world; we have gained pure, genuine man.”

This one proposition is enough to show what kind of “reliability” and profundity” one can expect from Herr Grün. He does not discuss small questions. Equipped with an unquestioning faith in the conclusions of German philosophy, as formulated by Feuerbach, viz., that “man”, “pure, genuine man”, is the ultimate purpose of world history, that religion is externalised [*entäusserte*] human essence, that human essence is human essence and the measure of all things — equipped with all the other truths of German socialism (see above) — i.e., that money, wage-labour, etc., are also externalisations [*Entäusserungen*] of human essence, that German socialism is the realisation of German philosophy and the theoretical truth of foreign socialism and communism, etc. — Herr Grün travels to Brussels and Paris with all the complacency of a true socialist. The powerful trumpetings of Herr Grün in praise of true socialism and of German science exceed anything his fellow-believers have achieved in this respect. As far as these eulogies refer to true socialism, they are obviously quite sincere. Herr Grün’s modesty does not permit him to utter a single sentence that has not already been pronounced by some other true socialist in the *Einundzwanzig Bogen*, the *Bürgerbuch* and the *Neue Anekdota.* Indeed, he devotes his whole book to filling in an outline of the French social movement sketched in the *Einundzwanzig Bogen* (pp. 74-88) by Hess, and thereby answering a need expressed in the same work on page 88 [See Moses Hess, “Socialismus und Communismus"]. As regards the eulogies to German philosophy, the latter must value them all the more, seeing how little he knows about it. The national pride of the true socialists, their pride in Germany as the land of “man”, of “human essence”, as opposed to the other profane nationalities, reaches its climax in him. We give below a few samples of it:

“But I should like to know whether they won’t all have to learn from us, these French and English, Belgians and North Americans” (p. 28).

He now enlarges upon this.

“The North Americans appear to me thoroughly prosaic and, despite their legal freedom, it is from us that they will probably have to learn their socialism” (p. 101).

Particularly because they have had, since 1829, their own socialist and democratic school [7], against which their economist Cooper was fighting as long ago as 1830.

"The Belgian democrats! Do you really think that they are half so far advanced as we Germans are? Why, I have just had a tussle with one of them who considered the realisation of free humanity to be a chimera!" (p. 28).

The nationality of "man", of "human essence", of "humanity" shows off here as vastly superior to Belgian nationality.

"Frenchmen! Leave Hegel in peace until you understand him." (We believe that Lerminier's criticism of the philosophy of law [Eugène Lerminier, Philosophie du droit], however weak it may be, shows more insight into Hegel than anything which Herr Grün has written either under his own name or that of "Ernst von der Haide".) "Try drinking no coffee, no wine for a year; don't give way to passionate excitement; let Guizot rule and let Algeria come under the sway of Morocco" (how is Algeria ever to come under the sway of Morocco, even if the French were to relinquish it?); "sit in a garret and study the Logik and the Phänomenologie. And when you come down after a year, lean in frame and red of eye, and go into the street and stumble over some dandy or town crier, don't be abashed. For in the meantime you will have become great and mighty men, Your mind will be like an oak that is nourished by miraculous" (!) "sap; whatever you see will yield up to you its most secret weaknesses; though You are created spirits, you will nevertheless penetrate to the heart of nature; your glance will be fatal, your word will move mountains, your dialectic will be keener than the keenest guillotine. You will present yourself at the Hôtel de Ville — and the bourgeoisie is a thing of the past. You will step up to the Palais Bourbon — and it collapses. The whole Chamber of Deputies will disappear into the void. Guizot will vanish, Louis Philippe will fade into an historical ghost and out of all these forces which You have annihilated there will rise victorious the absolute idea of free society. Seriously, you can only subdue Hegel by first of all becoming Hegel yourselves. As I have already remarked — Moor's beloved can only die at the hands of Moor" [Friedrich Schiller, Die Räuber, Act X", Scene 2] (pp. 115, 116).

The belletristic aroma of these true socialist statements will be noticed by, everyone. Herr Grün, like all true socialists, does not forget to bring up again the old chatter about the superficiality of the French:

"For I am fated to find the French mind inadequate and superficial, every time that I come into (:lose contact with it" (p. 371).

Herr Grün does not conceal from us the fact that his book is intended to glorify German socialism as the criticism of French socialism:

"The riff-raff of current German literature call our socialist endeavours an imitation of French perversities. No one has so far considered it worth while to replace to this. The riff-raff must surely feel ashamed, if they have any sense of shame at all, when they read this book. It probably never entered their head that German socialism is a criticism of French socialism, that far from considering the French to be the inventors of a new Contrat social, it demands that French socialism should make good its deficiencies by a study of German

science. At this moment, an edition of a translation of Feuerbach's Wesen des Christenthums is being prepared here in Paris. May their German schooling do the French much good! Whatever may arise from the economic position of the country or the constellation of politics in this country, only the humanistic outlook will ensure a human existence for the future. The Germans, unpolitical and despised as they are, this nation which is no nation, will have laid the cornerstone of the building of the future" (p. 353).

Of course, there is no need for a true socialist, absorbed in his intimacy with "human essence", to know anything about what "may arise from the economic position and the political constellation" of a country. Herr Grün, as an apostle of true socialism, does not merely, like his fellow-apostles, boast of the omniscience of the Germans as compared with the ignorance of the other nations. Utilising his previous experience as a man of letters, he forces himself, in the worst globe-trotter manner, upon the representatives of the various socialist, democratic and communist parties and when he has sniffed them from all angles, he presents himself to them as the apostle of true socialism. All that remains for him to do is to teach them, to communicate to them the profoundest discoveries concerning free humanity. The superiority of true socialism over the French parties now assumes the form of the personal superiority of Herr Grün over the representatives of these parties. Finally, this gives him a chance not only of utilising the French party leaders as a pedestal for Herr Grün, but also of talking all sorts of gossip, thereby compensating the German provincial for the exertion which the more pregnant statements of true socialism have caused him.

"Kats pulled a face expressive of plebeian cheerfulness when I assured him of my complete satisfaction with his speech" (p. 50).

Herr Grün lost no time in instructing Kats about French terrorism and "had the good fortune to win the approval of my new friend" (p. 51). His effect on *Proudhon* was important too, but lit a different way.

"I had the infinite pleasure of acting, so to speak, as the tutor of the man whose acumen has not perhaps been surpassed since Lessing and Kant" (p. 404).

Louis Blanc is merely "his swarthy young friend" (p. 314).

"He asked very eagerly but also very, ignorantly about conditions with us. We Germans know" (?) "French conditions almost as well as the French themselves; at least we study" (?) "them" (p. 315).

And we learn of "Papa *Cabet*" that he "has limitations" (p. 382). Herr Grün raised a number of questions, and Cabet

"confessed that he had not exactly been able to fathom them. I" (Grün) "had noticed this long ago; and that, of course, meant an end of everything, especially as it occurred to me that Cabet's mission had long ago been fulfilled" (p. 381).

We shall see later how Herr Grün contrives to give Cabet a new mission".

Let us first deal with the outline and the few well-worn general ideas which form the skeleton of Grün's book. Both are copied from Hess, whom Herr Grün paraphrases indeed in the most lordly fashion. Matters which are quite vague and mystical even in Hess, but which were originally — in the *Einundzwanzig Bogen* — worthy of recognition, and have only become tiresome and reactionary as a result of their perpetual reappearance in the *Bürgerbuch*, the *Neue Anekdota* and the *Rheinische Jahrbücher,* at a time when they were already out of date, become complete nonsense in Herr Grün's hands.

Hess synthesises the development of French socialism and the development of German philosophy — Saint-Simon and Schelling, Fourier and Hegel, Proudhon and Feuerbach. Compare, for example, Einundzwanzig Bogen, pp. 78, 79, 326, 327; *Neue Anekdota,* pp. 194, 195, 196, 202 ff.' (Parallels between Feuerbach and Proudhon, e.g., Hess: "Feuerbach is the German Proudhon", etc., *Neue Anekdota,* p. 202. Grün: "Proudhon is the French Feuerbach", p. 404.)

This schematism in the form given it by Hess is all that holds Grün's book together. But, of course, Herr Grün does not fail to add a few literary flourishes to Hess' propositions. Even obvious blunders on the part of Hess, e.g., that theoretical constructions form the '.'social background" and the "theoretical basis" of practical movements (e.g., *Neue Anekdota,* p. 192) are copied faithfully by Herr Grün. (E.g., Grün, p. 264: "The social background of the political question in the eighteenth century ... was the simultaneous product of the two philosophic tendencies" — that of the sensationists and that of the deists.) He copies, too, the opinion that it is only necessary to put Feuerbach into practice, to apply him to social life, in order to produce the complete critique of existing society. If one adds the other critical remarks which Hess directed against French communism and socialism, for example: "Fourier, Proudhon, etc., did not get beyond the. category of wage-labour" (*Bürgerbuch*, p. 46 and elsewhere'); "Fourier would like to present new associations of egoism to the world" *(Neue Anekdota*, p. 196); "Even the radical French communists have not yet risen above the opposition of labour and enjoyment. They have not yet grasped the *unity of production and consumption*, etc." (*Bürgerbuch*, p. 43); "Anarchy is the negation of the concept of political rule" (*Einundzwanzig Bogen*, p. 77), etc., if one adds these, one has pocketed the whole of Herr Grün's critique of the French. As a matter of fact he had it in his pocket before he went to Paris. In settling accounts with the French socialists and communists Herr Grün also obtains great assistance from the various traditional phrases current in Germany about religion, politics, nationality, human and inhuman, etc., which have been taken over by the true socialists from the philosophers. All he has to do is to hunt everywhere for the words "*Man*" and "human" and condemn when he cannot find them. For example: "You are political. Then you are narrow-minded" (p. 283). In the same way, Herr Grün 'IS enabled to exclaim: You are national, religious, addicted to political economy, you have a God — then you are not human, you are narrow-minded. This is a process which he follows throughout his book, thereby, of course, providing a thorough criticism of politics, nationality, religion, etc., and at the same time an adequate elucidation of the characteristics of the authors criticised and their connection with social development.

One can see from this that Grün's fabrication is on a much lower level than the work by *Stein*, who at least tried to explain the connection between socialist literature and the real development of French society. It need hardly be mentioned that in the book under discussion, as in the *Neue Anekdota,* Herr Grün adopts a very grand and condescending manner towards his predecessor.

But has Herr Grün even succeeded in copying correctly what he has taken over from Hess and others? Has he even incorporated the necessary material in the outline which he has taken over lock, stock and barrel in the most uncritical fashion? Has he given a correct and complete exposition of the individual socialist authors according to the sources? Surely this is the least one could ask of the man from whom the North Americans, the French, the English and the Belgians have to learn, the man who was the tutor of Proudhon and who perpetually brandishes his German thoroughness before the eyes of the superficial Frenchmen.

Saint Simonism

Herr Grün has no first-hand knowledge *of a single* Saint-Simonian *book*. His main sources are: primarily, the much despised *Lorenz Stein*; furthermore, Stein's chief source, *L. Reybaud* [Louis Reybaud, Études sur les réformateurs ou socialistes moderne] (in return for which he proposes to make an example of Herr Reybaud and calls him a philistine, p. 260; on the same page he pretends that he only came across Reybaud's book by chance long after he had settled with the Saint-Simonists); and occasionally *Louis Blanc* [Histoire de dix ans], We shall give direct proofs.

First let us see what Herr Grün writes about Saint-Simon's life.

The main sources for Saint-Simon's life are the fragments of his autobiography in *the Oeuvres de Saint-Simon*, published by Olinde Rodrigues, and the *Organisateur* of May 19th, 1830. We have, therefore, all the documents here before us: 1) The original sources; 2) Reybaud, who summarised them; 3) Stein, who utilised Reybaud; 4) Herr Grün's belletristic edition.

Herr Grün:

"Saint-Simon took part in the American struggle for independence without having any particular interest in the war itself; it occurred to him that there was a possibility of linking the two great oceans" (p. 84).

Stein, page 143:

"First he entered military service ... and went to America with Bouillé.... In this war, the significance of which he, of course, realised.... The war, as such, he said. did not interest me, only the purpose of this war, etc...... "After he had vainly tried to interest the Viceroy of Mexico in a plan to build a great canal linking the two oceans."

Reybaud, page 77:

"A fighter for American independence, he served under Washington.... The war in itself did not interest me, he said, but I was keenly interested in the object of the war and this interest induced me to endure its hardships without demur."

Herr Grün only copies the fact that Saint-Simon had "no particular interest in the war itself"; he omits the whole point-his interest in the object of the war.

Herr Grün further omits to state that Saint-Simon wanted to win the Viceroy's support for his plan and thus turns the plan into a mere "idea". He likewise omits to mention that Saint-Simon did this only "*à la paix*", the reason being that Stein indicates this merely by giving the date.

Herr Grün proceeds without a break:

"Later" (when?) "he drafted a plan for a Franco-Dutch expedition to the British Indies" (Ibid.).

Stein:

"He travelled to Holland in 1785, to draft a plan for a joint Franco-Dutch expedition against the British colonies in India" (p. 143).

Stein is incorrect here and Grün copies him faithfully. According to Saint-Simon, the Duc de la Vauguyon had induced the States-General [8] to undertake a joint expedition with France to the British colonies in India. Concerning himself, he merely says that he *worked*" (*poursuivi*) "for the execution of this plan for a year". *Herr Grün*:

"When in Spain, he wished to dig a canal from Madrid to the sea" (ibid.).

Saint-Simon wished to *dig a canal*? What nonsense! Previously, it *occurred to him* to do something, now he *wishes* to do something. Grün gets his facts wrong this time not because he copies Stein too faithfully as he did before, but because he copies him too superficially. *Stein*, page 144:

"Having returned to France in 1786, he visited Spain the very next year to present to the Government a plan for the completion of a canal from Madrid to the sea."

Herr Grün could derive the foregoing sentence skimming through Stein, for with Stein it seems at least as if the plan of construction and the idea of the whole project originated with Saint-Simon. As a matter of fact, Saint-Simon merely drew up a plan to overcome the financial difficulties besetting the building of the canal, the construction of which had been started long ago. *Reybaud:*

"Six years later, he put before the Spanish Government a plan for the construction of a canal with the object of establishing a navigable route from Madrid to the sea."

The same mistake as that made by Stein. *Saint-Simon*, page XVII:

"The Spanish Government had undertaken the construction of a canal which was to link Madrid with the sea; the scheme came to a standstill since the Government lacked labour and funds; I joined forces with M. le Comte de Cabarrus, now Finance Minister, and we presented the following plan to the Government." etc.

Herr Grün:

"In France he speculates on national domains."

Stein first of all sketches Saint-Simon's attitude during the revolution and then passes to his speculation in national domains, p. 144 et seq. But where Herr Grün has got the nonsensical expression: "to speculate *on* national domains", instead of *in* national domains, we can likewise explain by offering the reader the original: *Reybaud*, page 78:

"Having returned to Paris, he turned his attention to speculation and dealt in national domains" [sur les domaines nationaux literally translated means "on national domains"].

Herr Grün makes the foregoing statement without giving any explanation. He does not indicate why Saint-Simon should have speculated in national domains and why this fact, trivial in itself, should be of importance in his life. For Herr Grün finds it unnecessary to copy from Stein and Reybaud the fact that Saint-Simon wished to found a scientific school and a great industrial undertaking by way of experiment, and that he intended to raise the necessary capital by these speculations. These are the reasons which Saint-Simon himself gives for his speculations. (*Oeuvres*, p. xix.) *Herr Grün*:

"He marries so that he may be able to act as the host of science, to investigate the lives of men and exploit them psychologically" (ibid.).

Herr Grün here suddenly skips one of the most important periods of Saint-Simon's life — the period during which he studied natural science and travelled for that purpose. What is the meaning of marrying *to be the host of science?* What is the meaning of marrying in order to exploit *men* (whom one does not marry) psychologically, etc.? The whole point is this: Saint-Simon married so that he could hold a salon and study there among others the men of learning. Stein puts it in this way, page 149:

"He marries in 1801.... I made use of my married life to study the men of learning" (cf. Saint-Simon, p. 23).

Since we have now collated it with the original, we are in a position to understand and explain Herr Grün's nonsense.

The "psychological exploitation of *men*" amounts in Stein and in Saint-Simon himself merely to the observation of *men of learning* in their social life. It was in conformity with his socialist outlook that Saint-Simon should wish to acquaint himself with the influence of science upon the personality of men of learning and upon their behaviour in ordinary life. For Herr Grün this wish turns into a senseless, vague romantic whim.

Herr Grün:

"He becomes poor" (how, in what way?), "he works as a clerk in a pawnshop at a salary of a thousand francs a year — he, a count, a scion of Charlemagne; then" (when and why?) "he lives on the bounty of a former servant of his; later" (when and why?) "he tries to shoot himself, is rescued and begins a new life of study and propaganda. Only now does he write his two chief works."

"He becomes" — "then" — "later" — now" — such phrases in the work of Herr Grün are to serve as substitutes for the chronological order and the connecting links between the various phases of Saint-Simon's life. Stein, pages 156, 157:

"Moreover, there appeared a new and a fearful enemy — actual poverty, which became more and more oppressive.... After a distressing wait of six months... he obtained a position — " (Herr Grün gets even the dash from Stein, but he is cunning enough to insert it after the pawnshop) "as clerk in the pawnshop" (not, as Herr Grün artfully writes, "in a pawnshop", since it is well known that in Paris there is only one such establishment, and that a public one) "at a salary of a

thousand francs a year. How his fortune fluctuated in those days! The grandson of Louis XIV's famous courtier, the heir to a ducal coronet and to an immense fortune, by birth a peer of France and a Grandee of Spain, a clerk in a pawnshop!"

Now we see the source of Herr Grün's mistake regarding the pawnshop; here, in Stein, the expression is appropriate. To accentuate his difference from Stein, Grün only calls Saint-Simon a count" and a "scion of Charlemagne". He has the last fact from Stein (p. 142) and Reybaud (p. 77), but they are wise enough to say that it was Saint-Simon himself who used to trace his descent from Charlemagne. Whereas Stein offers positive facts which make Saint-Simon's poverty seem surprising *under the Restoration,* Herr Grün only expresses his astonishment that a count and an alleged scion of Charlemagne can possibly find himself in reduced circumstances. *Stein:*

"He lived two more years" (after his attempted suicide) "and perhaps achieved more during them than during any two decades earlier in his life. The Catéchisme des industriels was completed" (Herr Grün transforms this completion of a work which had long been in preparation into: "Only now did he write", etc.) "and the Nouveau christianisme, etc." (pp. 164, 165).

On page 169 Stein calls these two books "*the two chief works of his life*".

Herr Grün has, therefore, not merely *copied the errors of Stein* but has also *produced new errors* on the basis of obscure passages of Stein. To conceal his plagiarism, he selects only the outstanding facts; but he robs them of their factual character by tearing them out of their chronological context and omitting not only the motives governing them, but even the most vital connecting links. What we have given above is, literally, *all* that Herr Grün has to relate about the life of Saint-Simon. In his version, the dynamic, active life of Saint-Simon becomes a mere succession of ideas and events which are of less interest than the life of any peasant or speculator who lived through those stormy times in one of the French provinces. After dashing off this piece of biographical hack-work, he exclaims: "this whole, *truly civilised* life!" He does not even shrink from saying (p. 85): "Saint-Simon's life is the mirror of Saint-Simonism itself " — as if Grün's "life" of Saint-Simon were the mirror of anything except Herr Grün's method of patching together a book.

We have spent some time discussing this biography because it is a classical example of the way in which Herr Grün deals *thoroughly* with the French socialists. Just as in this case, to conceal his borrowings, Herr Grün dashes off passages with an air of nonchalance, omits facts, falsifies and transposes, we shall watch him later developing all the symptoms of a plagiarist consumed by inward uneasiness: artificial confusion, to make comparison difficult; omission of sentences and words which he does not quite understand, being ignorant of the original, when quoting from his predecessors; free invention and embellishment in the form of phrases of indefinite meaning; treacherous attacks upon the very persons whom he is copying. Herr Grün is indeed so hasty and so precipitous in his plagiarism that he frequently refers to matters which he has never mentioned to his readers but which he, as a reader of Stein, carts round in his own head.

We shall now pass to Grün’s exposition of the doctrine of Saint-Simon.

1. Letters of an Inhabitant of Geneva to his Contemporaries [9]

Herr Grün did not gather clearly from Stein the connection between the plan for supporting the men of learning, outlined in the work quoted above, and the fantastic appendix to the brochure. He speaks of this work as if it treated mainly of a new organisation of society, and ends as follows:

"The spiritual power in the hands of the men of learning, the temporal power in the hands of the property-owners, the franchise for all" (p. 85, cf. Stein, p. 151,

Reybaud, p. 83).

The sentence: "The power of nominating the pet sons who are to act as leaders of humanity should be in the hands of everyone.", which Reybaud quotes from Saint-Simon (p. 47) and which Stein translates in the clumsiest fashion, is reduced by Herr Grün to "the franchise for all", which robs it of all meaning. Saint-Simon is referring to the election of the Newton Council, [10] Herr Grün is referring to elections in general.

Long after dismissing the *Lettres* in four or five sentences copied from Stein and Reybaud, and having already spoken of the *Nouveau christianisme*, Herr Grün suddenly returns to the *Lettres*.

"But it is certainly not to be achieved by abstract learning." (Still less by concrete ignorance, as we observe.) "For from the standpoint of abstract science, there was still a cleavage between the 'property-owners' and 'everyone'" (p. 87).

Herr Grün forgets that so far he has only mentioned the "franchise for all" and has not mentioned "everyone". But since he finds "*tout le monde*" in Stein and Reybaud, he puts "everyone" in inverted commas. He forgets, moreover, that he has not quoted the following passage from Stein's book, that is the passage which would justify the "*for*" in his own sentence:

"He" (Saint-Simon) "makes a distinction, apart from the sages or the men of learning, between the propriétaires and tout le monde. it is true that as yet there is no clearly marked boundary between these two groups ... but nevertheless, there lies in that indefinite idea of 'tout le monde' the germ of that class towards the understanding and uplifting of which his theory was later directed, i.e. the classe la plus nombreuse et la plus pauvre [the most numerous and poorest class], and in reality, too, this section of the people was at that time only potentially present" (p. 154).

Stein stresses the fact that Saint-Simon *already* makes a distinction between *propriétaires* and *tout le monde*, but *as yet* a very vague one. Herr Grün twists this so that it gives the impression that Saint-Simon *still* makes this distinction. This is naturally a great mistake on the part of Saint-Simon and is only to be explained by the fact that his standpoint in the *Lettres* is that of abstract science. But unfortunately, in the passage in question, Saint-Simon speaks by no means about differences in a future order of society, as Herr Grün thinks. He appeals for subscriptions to mankind as a whole, which, as he finds it, appears to him to be divided into three classes; not, as Stein believes, into *savants*, *propriétaires* and *tout le monde*; but 1) *savants* and *artistes* and all people of liberal ideas; 2) the opponents of innovation, i.e., the *propriétaires*, insofar as they do not join the first class; 3) the *surplus de l'humanité qui se rallie au mot: Égalité*. [rest of humanity which rallies around the slogan: Equality] These three classes form *tout le monde*. Cf. Saint-Simon, Lettres, pp. 21, 22. Since moreover Saint-Simon says later that he considers his distribution of power advantageous to all classes, we may take it that in the place where he speaks of this distribution, p. 47, tout *le* monde obviously corresponds to the *surplus* which rallies around the slogan "equality", without, however, excluding the other classes. Stein is roughly correct, although he pays no attention to the passage on pages 21 and 22. Herr Grün, who knows nothing of the original, clutches at Stein's slight error and succeeds in making sheer nonsense of his argument. We soon come across an even more striking example. We learn unexpectedly on page 94, where Herr Grün is no longer speaking of Saint-Simon but of his school:

"In one of his books, Saint-Simon utters the mysterious words: 'Women will be admitted, they may even be nominated.' From this almost barren seed, the whole gigantic uproar of the emancipation of women has sprung up."

Of course, if in some work or other Saint-Simon had spoken of admitting and nominating women to some unknown position, these would indeed be "mysterious words". But the mystery exists only in the mind of Herr Grün. "One of Saint-Simon's books" is none other than the *Lettres d'un habitant de Genève*. In this work, after stating that everyone is eligible to subscribe to the Newton Council or its departments, he continues: " Women will be allowed *to subscribe,* it will be possible *to nominate* them" — that is, to a position in this Council or its departments, of course. Stein, as was fitting, quotes this passage in the course of his discussion of the book itself and makes the following comment:

Here, etc., "are to be found the germs of his later opinions and even those of his school; and even the first idea of the emancipation of women" (p. 152).

In a note Stein points out quite rightly that for polemical reasons Olinde Rodrigues printed this passage in large type in his 1832 edition, since it was the only reference to the emancipation of women in Saint-Simon's work. To hide his plagiarism, Grün shifts the passage from the book to which it belongs to his discussion of the school, makes the above nonsense of it, changes Stein's "germ" into a "seed" and childishly imagines that this passage is the origin of the doctrine of the emancipation of women. Herr Grün ventures an opinion on the contradiction which, he believes, exists between the *Lettres* and the *Catéchisme des industriels*; it consists in the fact that in the *Catéchisme* the rights of the travailleurs are asserted. He was bound to discover this difference, of course, because he derived his knowledge of the *Lettres* from Stein and Reybaud, and his knowledge of the *Catéchisme* similarly. Had he read Saint-Simon himself, he would have found in the *Lettres* not this contradiction, but a "seed" of the point of view developed among others in the *Catéchisme*. For example:

“All men will work” (Lettres, p. 60). “If his brain......... is not fitted for labour, he will be compelled to work with his hands; for Newton will assuredly not permit on this planet ... workers who, intentionally, remain idle in the workshops” (p. 64).

2. Political Catechism of the Industrialists

As Stein usually quotes this work as the *Catéchisme des industriels,* Herr Grün knows of no other title. But since he only devotes ten lines to this work when he comes to speak of it *ex officio,* one might have at least expected him to give its *correct title*.

Having copied from Stein the fact that in this work Saint-Simon wants labour to govern, he continues:

"He now divides the world into idlers and industrialists" (p. 85).

Herr Grün is wrong here. He attributes to the *Catéchisme* a distinction which he finds set out in Stein much later, in connection with the school of Saint-Simon. Stein, page 206:

"Society consists at present only of idlers and workers" (Enfantin).

Instead of this alleged division, there is in the *Catéchisme* a division into three classes, the *classes féodale, intermédiaire et indulstrielle;* naturally, Herr Grün could not enlarge upon this without recourse to Stein, since he was not familiar with the *Catéchisme* itself. Herr Grün then repeats once more that the content of the *Catéchisme* is the rule of labour and concludes his account of the work as follows:

"Just as republicanism proclaims: Everything for the people, everything through the people, Saint-Simon proclaims: Everything for industry, everything through industry" (ibid,).

Stein, page 165:

"Since industry is the source of everything, everything must serve industry."

Stein rightly states (page 160, note) that Saint-Simon's work *L'industrie*, printed as early as 1817, bears the motto: *Tout par l'industrie, tout pour elle*. In his account of the *Catéchisme,* Herr Grün, therefore, not only commits the error mentioned above but also misquotes the motto of a much earlier work of which he has no knowledge whatever.

German thoroughness has in this way given an adequate criticism of the *Catéchisme politique des industriels*. We find however scattered throughout Grün's *omnium gatherum* isolated glosses which belong properly to this section. Chuckling over his own slyness, Herr Grün distributes the material which he finds in Stein's account of the work and elaborates it with commendable courage.

Herr Grün, page 87:

"Free competition was an impure and confused concept, a concept which contained in itself a new world of conflict and misery, the struggle between capital and labour and the misery of the worker who has no capital. Saint-Simon purified the concept of industry; he reduced it to the concept of the workers, he formulated the rights and grievances of the fourth estate, of the proletariat. He was forced to abolish the right of inheritance, since it had

become an injustice towards the worker, towards the industrialist. This is the significance of his Catéchisme des industriels."

Herr Grün found the following observation in Stein's book (p. 169) with regard to the *Catéchisme*:

"It is, therefore, the true significance of Saint-Simon that he foresaw the inevitability of this contradiction" (between bourgeoisie and *peuple*).

This is the source of Herr Grün's idea of the "*significance*" of the *Catéchisme*. Stein:

"He" (Saint-Simon in the Catéchisme) "begins with the concept of the industrial worker."

Herr Grün turns this into complete nonsense by asserting that Saint-Simon, who found free competition as an "*impure concept*", "purified the *concept of industry* and reduced it to the *concept of the workers*". Herr Grün shows everywhere that his concept of free competition and industry is a very "impure" and a very "confused" one indeed.

Not satisfied with this nonsense, Herr Grün risks a direct falsehood and states that Saint-Simon demanded the abolition of the right of inheritance.

On page 88 he tells us, still relying on his interpretation of Stein s version of the *Catéchisme:*

"Saint-Simon established the rights of the proletariat. He already formulated the new watchword: the industrialists, the workers, shall be raised to a position of supreme power. This was one-sided, but every struggle involves one-sidedness; he who is not one-sided cannot wage a struggle."

Despite his rhetorical maxim about one-sidedness, Herr Grün himself commits the one-sided error of understanding Stein to say that Saint-Simon wished to "raise" the real workers, the *proletarians*, to a position of supreme power". Cf. page 102, where he says of Michel Chevalier:

"M. Chevalier still refers with great sympathy to the industrialists.... But to the disciple, the industrialists are no longer, as they were for his master, the proletarians; he includes capitalists, entrepreneurs and workers in one concept, that is to say, he includes the idlers in a category which should only embrace the poorest and most numerous class."

Saint-Simon numbers among the industrialists not only the workers, but also the *fabricants*, the *négociants*, in short, *all industrial capitalists;* indeed, he addresses himself primarily to them. Herr Grün could have found this on the very first page of the *Catéchisme*. But this shows how, without ever having seen the work, he concocts from hearsay fine phrases about it. Discussing the *Catéchisme,* Stein says:

"After ... Saint-Simon comes to a history of industry in its relation to state authority ... he is the first to be conscious that in the science of industry there lies hidden a political factor.... It is undeniable that he succeeded in giving an

important stimulus. For France possesses a histoire de 1'économie politique only since Saint-Simon", etc. (pp. 165, 170).

Stein himself is extremely vague when he speaks of a "political factor" in "the science of industry". But he shows that he is on the right track by adding that the history of the state is intimately connected with the history of national economy. Let us see how Herr Grün later, in his discussion of the school of Saint-Simon, appropriates this fragment of Stein:

"Saint-Simon had attempted a history of industry in his Catéchisme des industriels stressing the political element in it. The master himself paved the way, therefore, for political economy" (p. 99).

Herr Grün "therefore" transforms the "political *factor*" of Stein into a "political *element*" and turns it into a meaningless phrase by omitting the details given by Stein. This "stone which the builders have rejected" [cf. 1 Peter 2: 7] has indeed become for Herr Grün the "cornerstone" of his *Briefe und Studien.* [Letters and Studies is the sub-title of Grün's book, Die soziale Bewegung in Frankreich und Belgien] But it has also become for him a stumbling-block. [Stein — stone, Eckstein — cornerstone, and Stein des Anstosses — stumbling-block] But that is not all. Whereas Stein says that Saint-Simon paved the way for a *history* of political economy by stressing the political factor in the science of industry, Herr Grün makes him the pioneer of *political economy itself.* Herr Grün argues something after this fashion: Economics existed already *before* Saint-Simon; but, as Stein relates, *Saint-Simon* stressed the political factor in industry, therefore he made economics political-political economics = political economy — hence Saint-Simon paved the way for political economy. In his conjectures Herr Grün undoubtedly displays a very genial spirit. Just as he makes Saint-Simon the pioneer of political economy, he makes him the pioneer of scientific socialism:

"It" (Saint-Simonism) "contains ... scientific socialism, for Saint-Simon spent his whole life searching for the new science"' (p. 82).

3. New Christianity

With his customary brilliance, Herr Grün continues to give us extracts of extracts by, Stein and Reybaud, to which he adds literary embellishments and which he dismembers in the most pitiless fashion. *One* example will suffice to show that he has never looked at the original of this work either.

"For Saint-Simon it was a question of establishing a unified view of life, such as is suitable to organic periods of history, which he expressly opposes to the critical periods. According to him, we have been living since Luther in a critical period; he thought to initiate a new organic period. Hence the New Christianity" (p. 88).

At *no time* and in *no place* did Saint-Simon oppose organic to critical periods of history. This is a downright falsehood on the part of Herr Grün. *Bazard* was the first to make this distinction. [see Doctrine de Saint-Simon. Exposition. Première anné] Herr Grün discovered from Stein and Reybaud that in *Nouveau christianisme* Saint-Simon commends the *criticism* of Luther, but finds his positive, dogmatic *doctrine* faulty. Herr Grün lumps that with what he remembers was said in the same sources about the *school* of Saint-Simon, and out of this he fabricates the above assertion. After some florid comments on Saint-Simon's life and works produced by Herr Grün in the manner described earlier and based exclusively on Stein and the latter's primer, Reybaud, Herr Grün concludes by exclaiming:

"And those moral philistines, Herr Reybaud and the whole band of German parrots, thought that they had to defend Saint-Simon, by pronouncing with their usual wisdom that such a man, such a life, must not he measured by ordinary standards! — Tell me, are your standards made of wood? Tell the truth! We shall be quite pleased if they are made of good solid oak. Hand them over! We shall gratefully accept them as a precious gift. We shall not burn them, God forbid! We shall use them to measure the backs of the philistines" (p. 89).

It is by affected bluster of this kind that Herr Grün attempts to prove his superiority over the men whom he has copied.

4. The School of Saint Simon

Since Herr Grün has read just as much of the school of Saint-Simon as he read of Saint-Simon himself, that is nothing whatsoever, he should at least have made a proper summary of Stein and Reybaud, he should have observed the chronological order, he should have given a connected account of the course of the events and he should have mentioned the essential points. He does the contrary. Led astray by his bad conscience, he mixes everything up as far as possible, omits the most essential matters and produces a confusion even greater than that which we saw in his exposition of Saint-Simon. We must be still more concise here, for it would take a volume as thick as Herr Grün's to record every plagiarism and every blunder.

We are given no information about the period from the death of Saint-Simon to the July [1830] Revolution — period which covers part of the most important theoretical development of Saint-Simonism. And accordingly the Saint-Simonian criticism of existing conditions, the most important aspect of Saint-Simonism, is entirely omitted by Herr Grün. It is indeed hardly possible to say anything about it without knowledge of the sources, and in particular of the newspapers.

Herr Grün opens his discourse on the Saint-Simonists with these words:

"To each according to his capacity, to each capacity according to its works: that is the practical dogma of the Saint-Simonists."

Like Reybaud (p. 96), Herr Grün presents this sentence as a transition from Saint-Simon to the Saint-Simonists and continues:

"It derives directly from the last words of Saint-Simon: all men must be assured the freest development of their faculties."

In this case Herr Grün wished to be different from Reybaud, who links the "practical dogma" with the *Nouveau christianisme*. Herr Grün believes this to be an invention of Reybaud's and unceremoniously substitutes the last words of Saint-Simon for the *Nouveau christianisme*. He did not realise that Reybaud was only giving a literal extract from the *Doctrine de Saint-Simon. Exposition. Première année*, p. 70. Herr Grün cannot understand why Reybaud, after giving several extracts concerning the religious hierarchy of Saint-Simonism, should suddenly introduce the "practical dogma". Herr Gran imagines that the hierarchy follows directly from this proposition. But in fact, the proposition can refer to a new hierarchy only when taken in conjunction with the religious ideas of the *Nouveau christianisme*, whereas apart from these ideas, it can demand at most a purely secular classification of society. He observes on page 91:

"To each according to his capacity means to make the Catholic hierarchy the law of the social order. To each capacity according to its works means moreover to turn the workshop into a sacristy and the whole of civil life into a priestly preserve."

For in the above-mentioned extract from the *Exposition* quoted by Reybaud Herr Grün finds the following:

"The truly universal Church shall appear ... the universal Church shall govern temporal as well as spiritual matters ... science shall be sacred, industry shall be sacred ... and all property shall be the property of the Church, every profession a religious function, a step in the social hierarchy. — To each according to his capacity, to each capacity, according to its works."

To produce his own quite incomprehensible statement, Herr Grün had only to invert this passage and change the preceding sentences into conclusions of the final sentence.

Grün's interpretation of Saint-Simonism assumes "so confused and tangled a form" that on page 90 he first derives a "spiritual proletariat" from the "practical dogma", then from the spiritual proletariat he produces a "hierarchy of minds". Finally, out of the hierarchy by of minds he produces the apex of the hierarchy. Had he read even only the *Exposition*, he would have seen that the religious approach of the *Nouveau christianisme*, together with the problem of how to determine *capacité*, necessitates the hierarchy and its apex.

Herr Grün concludes his discussion and criticism of the Exposition of 1828-29 with the single sentence: "*À chacun selon sa capacité, à chaque capacité selon ses oeuvres.*" Apart from this he hardly even mentions the *Producteur* and the *Organisateur*. He glances at Reybaud and finds in the section "Third Epoch of Saint-Simonism", p. 126 (Stein, p. 205):

. ..... and during the following days the Globe appeared with the subtitle: Journal of the Saint-Simonian Doctrine, which was summarised as follows on the first page:

Religion
Science *Industry*
Universal Association.

Herr Grün passes from the above to the year 1831, without a break, and improves upon Reybaud in the following terms (p. 91):

"The Saint-Simonists put forward the following outline of their system; the formulation was largely the work of Bazard:

Religion
Science *Industry*
Universal Association.

Herr Grün leaves out three sentences which are also to be found on the title-page of the *Globe* and which all relate to practical social reforms.[11] — They are given by both Stein and Reybaud. This enables him to change what is, so to speak, the mere window-dressing of a journal into an "outline" of the system. He conceals the fact that it appeared on the title-page of the *Globe* and so can criticise the whole of Saint-Simonism, as contained in the mutilated title of this newspaper, with the clever comment that religion has *pride of place*. He could moreover have discovered from Stein that this is by no means true of the *Globe*. The *Globe* contains the most detailed and valuable criticism of existing conditions and particularly of economic conditions — a fact however which Herr Grün could not know.

It is difficult to say from where Herr Grün has obtained the new but important piece of information that the "formulation of the outline", four words in length, "was *largely* the work of *Bazard*".

Herr Grün now jumps from January 1831 back to October 1830:

"Shortly after the July Revolution, during the Bazard period" (where does this period come from?), "the Saint-Simonists addressed a short but comprehensive statement of their beliefs to the Chamber of Deputies, after Messrs. Dupin and Mauguin had accused them from the tribune of preaching community of goods and wives."

The Address follows, with the comment by Herr Grün:

"How reasonable and measured it all is still! The Address presented to the Chamber was edited by Bazard" (pp. 92-94).

To begin with the concluding remark, Stein says, p. 205:

"Judging from its form and its attitude, we should not hesitate to ascribe it" (the document), "as does Reybaud, to Bazard more than to Enfantin.

And Reybaud says, p. 123:

"From the form and the very moderate demands of this document, one can clearly see that it owes more to the initiative of M. Bazard than to that of his colleague."

With characteristic ingenuity and audacity, Herr Grün turns Reybaud's conjecture that Bazard *rather* than Enfantin was behind the Address into the certainty that he edited it in its entirety. The passage introducing the Address is translated from Reybaud, p. 122:

"Messrs. Dupin and Mauguin drew attention from the tribune to a sect which was preaching community of goods and community of wives."

Herr Grün merely leaves out the date given by Reybaud and writes instead: "shortly after the July Revolution". Altogether, chronology does not suit Herr Grün's method of emancipating himself from those who have trodden the ground before him. In contradistinction to Stein he inserts in the text what Stein relegates to a note, he omits the introduction to the Address, he translates *fonds de production* (productive capital) as " *basic capital*" and *classement social des individus* (social classification of individuals) as "social order of individuals".

Some slipshod notes follow on the history of the school of Saint-Simon; they have been patched together from fragments of Stein, Reybaud and Louis Blanc with that artistic skill which we noticed in Grün's life of Saint-Simon. We leave it to the reader to look them up in the book for himself.

The reader now has before him all that Herr Grün has to say of the Bazard period of Saint-Simonism, i.e., the period from the death of Saint-Simon to the first schism.[12] Grün is now in a position to play an elegantly critical trump, and call Bazard a "poor dialectician". Then he continues:

"But so are the republicans. They only know how to die, Cato as much as Bazard; if they do not stab themselves to death, they die of a broken heart" (p. 95).

"A few months after this quarrel, his" (Bazard's) "heart was broken" (Stein, p. 210).

Such republicans as Levasseur, Carnot, Barère, Billaud-Varennes, Buonarroti, Teste, d'Argenson, etc., etc., show how correct Herr Grün's assertion is. We are now offered a few commonplaces about Enfantin. Attention need only be drawn to the following discovery made by Herr Grün:

"Does this historical phenomenon not make it finally clear that religion is nothing but sensualism, that materialism can boldly claim the same origin as the sacred dogma itself?" (p. 97).

Herr Grün looks complacently about him: "Has anyone else ever *thought of that?*" He would never have "*thought of that*" if the *Hallische Jahrbücher* had not already "thought of it" in connection with the Romantics.[Karl Rosenkranz's article "Ludwig Tieck und die romantische Schule"] One would have expected Herr Grün to have made some little intellectual progress since then.

We have seen that Herr Grün knows nothing of the whole economic criticism of the Saint-Simonists. Nevertheless, he manages to say something, with the help of Enfantin, about the economic consequences of Saint-Simon's theory, to which he has already made some airy references earlier. He finds in Reybaud (p. 129 et seq.) and in Stein (p. 206) extracts from Enfantin's *Political Economy* [Barthélemy — Prosper Enfantin, Economie politique et Politique] but in this case, too, he falsifies the original; for the abolition of taxes on the most essential necessaries of life, which is correctly shown by Reybaud and Stein (who base their statements on Enfantin) to be a consequence of the proposals concerning the right of inheritance, is turned by Grün into an irrelevant, independent measure *in addition to* these proposals. He gives further proof of his originality by falsifying the chronological order; he refers first to the priest Enfantin and Ménilmontant and then to the *economist* Enfantin, whereas his predecessors deal with Enfantin's political economy during the Bazard period when they are discussing the *Globe,* for which it was written. [13] Just as here he includes the Bazard period in the Ménilmontant period so later, when referring to economics and to M. Chevalier, he brings in the Ménilmontant period. The occasion for this is the *Livre nouveau*,[14] and as usual he turns Reybaud's conjecture that M. Chevalier was the author of this work into a categorical assertion.

Herr Grün has now described Saint-Simonism "in its totality" (p. 82). He has kept the promise he made "not to subject its literature to a critical scrutiny" (ibid.) and has therefore got mixed up, most uncritically, in quite a different "literature", that of Stein and Reybaud. He gives us by way of compensation a few particulars about M. Chevalier's economic lectures of 1841-42, [Michel Chevalier, Cours d'Economie politique fait an Collège de France] a time when the latter had long ceased to be a Saint-Simonist. For while writing about Saint-Simonism, Herr Grün had in front of him a review of these lectures in the *Revue des deux Mondes*. He has made use of it in the same way as he utilised Stein and Reybaud. Here is a sample of his critical acumen:

"In it he asserts that not enough is being produced. That is a statement worthy of the old economic school with its rusty prejudices.... As long as political economy does not understand that production is dependent upon consumption, this so-called science will not make any headway" (p. 102).

One can see that with these phrases about consumption and production which he has inherited from true socialism, Herr Grün is far superior to any economic work. Apart from the fact that any economist would tell him that supply also depends on demand, i.e., that production depends on consumption, there is actually in France a special economic school, that of Sismondi, which desires to make production dependent on consumption in a form different from that which obtains under free competition; it stands in sharp opposition to the economists attacked by Herr Grün. Not till later, however, do we see Herr Grün speculating successfully with the talent [cf. Matthew 25:15-30 and Luke 19:13-26] entrusted to him — the unity of production and consumption. To compensate the reader for the boredom he has suffered from these sketchy extracts from Stein and Reybaud, which are moreover falsified and adulterated with phrases, Herr Grün offers him the following Young-German firework display, glowing with humanism and socialism:

"Saint-Simonism in its entirety as a social system was nothing more than a cascade of thoughts, showered by a beneficent cloud upon the soil of France" (earlier, pp. 82, 83, it was described as "a mass of light, but still a chaos of light" (!), "not yet an orderly illumination" (!). "It was both an overwhelming and a most amusing display. The author died before the show was put on, one producer died during the performance, the remaining producers and all the actors discarded their costumes, slipped into their civilian clothes, went home and behaved as if nothing had happened. It was a spectacle, an interesting spectacle, if somewhat confused towards the finale; a few of the performers overacted — and that was all" (p. 104).

How right was Heine when he said about his imitators: "I have sown dragon's teeth and harvested fleas."

Fourierism

Apart from the translation of a few passages from the *Quatre mouvements* [Charles Fourier, Théorie des quatre mouvements et des destinies générales] on the subject of love, there is nothing here that cannot be found in a more complete form in Stein. Herr Grün dismisses morality in a sentence which a hundred other writers had uttered long before Fourier:

“Morality is, according to Fourier, nothing but the systematic endeavour to repress the human passions” (p. 147).

That is how Christian morality has always defined itself. Herr Grün makes no attempt to examine Fourier’s criticism of present-day agriculture and industry and, as far as trade is concerned, he merely translates a few general remarks from the Introduction to a section of. the *Quatre mouvements* (“*Origine de l'économie politique et de la controverse mercantile*”, pp. 332, 334 of the *Quatre mouvements*). Then come a few extracts from the *Quatre mouvements* and one from the *Traité de l'association,* on the French Revolution, together with the tables on civilisation, which are already known from Stein. The critical side of Fourier, his most important contribution, is thus dismissed in the most hasty and superficial fashion in twenty-eight pages of literal translation; and in these, with very few exceptions, only the most general and abstract matters are discussed, the trivial and the important being thrown together in the most haphazard way.

Herr Grün now gives us an exposition of Fourier’s system. Churoa [August Ludwig Churoa, Kritische Dorstellung der Socialtheorie Fourier’s] whose work is quoted by Stein, long ago gave us a better and more complete version. Although Herr Grün considers it “vitally necessary” to offer a profound interpretation of Fourier’s series [15], he can think of nothing better than to quote literally from Fourier himself and then, as we shall see later, to coin a few fine phrases about numbers. He does not attempt to show how Fourier came to deal with series, and how he and his disciples constructed them; he reveals nothing whatever about the inner construction of the series. It is only possible to criticise such constructions (and this applies also to the Hegelian method) by demonstrating how they are made and thereby proving oneself master of them.

Lastly, Herr Grün neglects almost entirely a matter which Stein at any rate emphasises in some measure, the opposition of *travail répugnant* and *travail attrayant.*

The most important aspect of the whole exposition is Herr Grün’s criticism of Fourier. The reader may recollect what was said above concerning the sources of Grün’s criticism. He will now see from the few examples which follow that Herr Grün first of all accepts the postulates of true socialism and then sets about exaggerating and distorting them. It need hardly be mentioned that Fourier’s distinction between capital, talent and labour offers a magnificent opportunity for a display of pretentious cleverness; one can talk at length about the impracticability and the injustice of the distinction, about the introduction of wage-labour, etc., without criticising this distinction by reference to the *real* relationship of labour and capital. Proudhon has already said all this infinitely better than Herr Grün, but he failed to touch upon the real issue.

Herr Grün bases his criticism of Fourier's *psychology* — as indeed all his criticism — on the "essence of man":

"For human essence is all in all" (p. 190). "Fourier, too, appeals to this human essence and in his own way reveals to us its inner core" (!) "in his tabulation of the twelve passions; like all honest and reasonable people, he, too, desires to make man's inner essence a reality, a practical reality. That which is within must also be without, and thus the distinction between the internal and the external must be altogether abolished. The history of mankind teems with socialists, if this is to be their distinguishing feature.... The important thing about everyone is what he understands by the essence of man" (p. 190).

Or rather the important thing for the true socialists is to foist upon everyone thoughts about human essence and to transform the different stages of socialism into different philosophies of human essence. This unhistorical abstraction induces Herr Grün to proclaim the abolition of all distinction between the internal and the external, which would even put a stop to the propagation of human essence. But in any case, why should the Germans brag so loudly of their knowledge of human essence, since their knowledge does not go beyond the three general attributes, intellect, emotion and will, which have been fairly universally recognised since the days of Aristotle and the Stoics. It is from the same standpoint that Herr Grün reproaches Fourier with having "cleft" man into twelve passions.

"I shall not discuss the completeness of this table, psychologically speaking; I consider it inadequate" — (whereupon the public can rest easy, "psychologically speaking"). — "Does this number give us any knowledge of what man really is? Not for a moment. Fourier might just as well have enumerated the five senses; the whole man is seen to be contained in these, if they be properly explained and their human content rightly interpreted" (as if this "human content" is not entirely dependent on the stage of development which production and human intercourse have reached). " Indeed, it is in one sense alone that man is contained, in feeling; his feeling is different from that of the animal," etc. (p. 205).

For the first time in his whole book, Herr Grün is obviously making an effort to say something about Fourier's psychology from the standpoint of Feuerbach. He is obvious too that this "whole man", contained" in a single attribute of a real individual and interpreted by the philosopher in terms of that attribute, is a complete chimera. Anyway, what sort of man is this, "man" who is not seen in his real historical activity and existence, but can be deduced from the lobe of his own ear [Hegel, Vorlesungen über die Naturphilosophie, Einleitung, § 246, Zusatz] or from some other feature which distinguishes him from the animals? Such a man "is contained" in himself, like his own pimple. Of course, the discovery that human feeling is human and not animal not only makes all psychological experiment superfluous but also constitutes a critique of all psychology.

Herr Grün finds it an easy matter to criticise Fourier's treatment of love; he measures Fourier's criticism of existing amorous relationships against the fantasies by which Fourier tried to get a mental image of free love. Herr Grün, the true German philistine, takes these fantasies seriously. Indeed, they are the only thing which he does take seriously. It is hard to see why, if he wanted to deal with this side of the system at all, Grün did not also enlarge upon Fourier's remarks concerning education; they are by far the best of their kind and contain some masterly observations. Herr Grün, typical Young-German man of letters that he is, betrays, when he treats of love, how little he has learned from Fourier's critique. In his opinion, it is of no consequence whether one proceeds from the abolition of marriage or from the abolition of private property; the one must necessarily follow upon the other. But to wish to *proceed* from any dissolution of marriage other than that which now exists in practice in bourgeois society, is to cherish a purely literary illusion. Fourier, as Grün might have discovered in his works, always proceeds from the transformation of production.

Herr Grün is surprised that Fourier, who always starts with inclination (it should read: attraction), should indulge in all kinds of "mathematical" experiments, for which reason he calls him the mathematical socialist", page 203. Even if he did not take into account Fourier's circumstances, he might well have examined a little more closely the nature of attraction. He would very soon have discovered that a natural relation of the kind cannot be accurately defined without the help of calculation. He regales us instead with a philippic against number, a philippic in which literary flourishes and Hegelian tradition are intermixed. It contains passages such as:

Fourier "calculates the molecular content of your most abnormal taste".

Indeed, a miracle; and further:

"That civilisation, which is being so bitterly attacked, is based upon an unfeeling multiplication table.... Number is nothing definite.... What is the number one?... The number one is restless, it becomes two, three, four"

like the German country parson who is "restless" until he has a wife and nine children....

"Number stifles all that is essential and all that is real; can we halve reason or speak of a third of the truth?"

He might also have asked, can we speak of a green-coloured logarithm?...

"Number loses all sense in organic development"...

a statement of fundamental importance for physiology and organic chemistry (pp. 203, 204).

"He who makes number the measure of all things becomes, nay, is an egoist."

By a piece of wilful exaggeration, he links to this sentence another, which he has taken over from Hess (see above):

"Fourier's whole plan of organisation is based exclusively upon egoism.... Fourier is the very worst expression of civilised egoism" (pp. 206, 208).

He supplies immediate proof of this by relating that, in Fourier's world order, the poorest member eats from forty dishes every day, that five meals are eaten daily, that people live to the age of 144 and so on. With a naive sense of humour Fourier opposes a Gargantuan view of man to the unassuming mediocrity of the men of the Restoration period; but Herr Grün only sees in this a chance of moralising in his philistine way upon the most innocent side of Fourier's fancy, which he abstracts from the rest. While reproaching Fourier for his interpretation of the French Revolution, Herr Grün gives us a glimpse of his own insight into the revolutionary age:

"If association had only been known of forty years earlier" (so he makes Fourier say), "the Revolution could have been avoided. But how" (asks Herr Grün) "did it come about that Turgot, the Minister, recognised the right to work and that, in spite of this, Louis XVI lost his head? After all, it would have been easier to discharge the national debt by means of the right to work than by means of hen's eggs" (p. 211).

Herr Grün overlooks the trifling fact that the right to work, which Turgot speaks of, is none other than free competition and that this very free competition needed the Revolution in order to establish itself. The substance of Herr Grün's criticism of Fourier is that Fourier failed to subject "civilisation" to a "fundamental criticism". And why did he fail? Here is the reason:

"The manifestations of civilisation have been criticised but not its basis; it has been abhorred and ridiculed as it exists, but its roots have not been examined. Neither politics nor religion have undergone a searching criticism and for that reason the essence of man has not yet been examined" (p. 209).

So Herr Grün declares that the real living conditions of men are *manifestations*, whereas religion and politics are the *basis and the root* of these manifestations. This threadbare statement shows that the true socialists put forward the ideological phrases of German philosophy as truths superior to the real expositions of the French socialists; it shows at the same time that they try to link the true object of their own investigations, human essence, to the results of French social criticism. If one assumes religion and politics to be the basis of material living conditions, then it is only natural that everything should amount in the last instance to an investigation of human essence, i.e., of man's consciousness of himself. — One can see, incidentally, how little Herr Grün minds what he copies; in a later passage and in the *Rheinische Jahrbücher* as well, he appropriates, in his own manner, what the *Deutsch-Französische Jahrbücher* had to say about the relation of *citoyen* and *bourgeois*, which directly contradicts the statement he makes above. We have reserved to the end the exposition of a statement concerning production and consumption which true socialism confided to Herr Grün. It is a striking example of how Herr Grün uses the postulates of true socialism as a standard by which to measure the achievements of the French and how, by tearing the former out of their complete vagueness, he reveals them to be utter nonsense.

"Production and consumption can be separated temporally and spatially, in theory and in external reality, but in essence they are one. Is not the commonest occupation, e.g., the baking of bread, a productive activity, which is in its turn consumption for a hundred others? Is it not, indeed, consumption on the part of the baker himself, who consumes corn, water, milk, eggs, etc.? Is not the consumption of shoes and clothes production on the part of cobblers and tailors?... Do I not produce when I cat bread? I produce on an enormous scale. I produce mills, kneading-troughs, ovens and consequently ploughs, harrows, flails, mill-wheels, the labour of wood-workers and masons" ("and consequently", carpenters, masons and peasants, "consequently", their parents, "consequently", their whole ancestry, "consequently", Adam). "Do I not consume when I produce? On a huge scale, too.... If I read a book, I consume first of all the product of whole years of work; if I keep it or destroy it, I consume the material and the activity of the paper-mill, the printing-press and the bookbinder. But do I produce nothing? I produce perhaps a new book and thereby new paper, new type, new printer's ink, new bookbinding tools; if I merely read it and a thousand others read it too, we produce by our consumption a new edition and all the materials necessary for its manufacture. The manufacturers of all these consume on their part a mass of raw material which must be produced and which can only be produced through the medium of consumption.... In a word, activity and enjoyment are one, only a perverse world has torn them asunder and has thrust between them the concept of value and price., by means of this concept it has torn man asunder and with man, society" (pp. 191, 192).

Production and consumption are, in reality, frequently opposed to one another. But in order to restore the unity of the two and resolve all contradictions, one need only *interpret* these contradictions correctly and *comprehend* the true *nature* of production and consumption. Thus this German ideological theory fits the existing world perfectly; the unity of production and consumption is proved by means of examples drawn from present-day society, it exists *in itself.* Herr Grün demonstrates first of all that there actually does exist a relationship between production and consumption. He argues that he cannot wear a coat or eat bread unless both are produced and that there exist in modern society people who produce coats, shoes and bread which other people consume. This idea is, in Herr Grün's opinion, a new one. He clothes it in his classical, literary-ideological language. For example:

"It is believed that the enjoyment of coffee, sugar, etc., is mere consumption; but is this enjoyment not, in fact, production in the colonies?"

He might just as well have asked: Does not this enjoyment imply that Negro slaves enjoy the lash and that floggings are produced in the colonies? One can see that the outcome of such exuberance as this is simply an apology for existing conditions. Herr Grün's second idea is that when he produces, he consumes, namely raw material, the costs of production in fact; this is the discovery that nothing can be created out of nothing, that he must have *material.* He would have found set out in any ' political economy, under the heading "productive consumption", the complicated relations which this involves if one does not restrict oneself, like Herr Grün, to the trivial fact that shoes cannot be made without leather. So far, Herr Grün has realised that it is necessary to produce in order to consume and that raw material is consumed in the productive process. His real difficulties begin when he wishes to prove that he produces when he consumes. Herr Grün now makes a completely ineffective attempt to enlighten himself in some small degree upon the most commonplace and general aspects of the connection between supply and demand. He does discover that his consumption, i.e., his demand, produces a fresh supply. But he forgets that his demand must be *effective,* that he must offer an equivalent for the product desired, if his demand is to cause fresh production. The economists too refer to the inseparability of consumption and production and to the absolute identity of supply and demand, especially when they wish to prove that overproduction never takes place; but they never perpetrate anything so clumsy, so trivial as Herr Grün. This is moreover the same sort of argument that the aristocracy, the clergy, the rentiers, etc., have always used to prove their own productivity. Herr Grün forgets, further, that the bread which is produced today by steam-mills, was produced earlier by wind-mills and water-mills and earlier still by hand-mills; he forgets that these different methods of production are quite independent of the actual eating of the bread and that we are faced, therefore, with an historical development of the productive process. Of course, producing as he does on "an enormous scale", Herr Grün never thinks of this. He has no inkling of the fact that these different stages of production involve different relations of production to consumption, different contradictions of the two; it does not occur to him that to understand these contradictions one must examine the particular mode of production, together with the whole set of social conditions based upon it; and that only by actually changing the mode of production and the entire social system based upon it can these contradictions be solved. While the other examples given by Herr Grün prove that he surpasses even the most undistinguished economists in banality, his example of the book shows that these economists are far more "humane" than he is. They do not demand that as soon as he has consumed a book he should produce another! They are content that he should produce his own education by his consumption and so exert a favourable influence upon production in general. Herr Grün's productive consumption is transformed into a real miracle, since he omits the connecting link, the cash payment; he makes it superfluous by simply ignoring it, but in fact it alone makes his demand *effective.* He reads, and by the mere fact of his *reading*, he enables the type-founders, the paper manufacturers and the printers to produce new type, new paper and new books. The mere fact of his consumption compensates them all for their costs of production. Incidentally, in the foregoing examination we have amply demonstrated the virtuosity with which Herr Grün produces new books from old by merely reading the latter, and with which he incurs the gratitude of the commercial world by his activities as a producer of new paper, new type, new printer's ink and new bookbinding tools. Grün ends the first letter in his book with the words:

"I am on the point of plunging into industry."

Herr Grün never once belies this motto of his in the whole of his book.

What did all his activity amount to? In order to prove the true socialist proposition of the unity of production and consumption, Herr Grün has recourse to the most commonplace economic statements concerning supply and demand; moreover, he adapts these to his purpose simply by omitting the necessary connecting links, thereby transforming them into pure fantasies. The essence of all this is, therefore, an ill-informed and fantastic transfiguration of existing conditions.

In his socialistic conclusion, he lisps, characteristically, the phrases he has learned from his German predecessors. Production and consumption are separated because a perverse world has torn them asunder. How did this perverse world set about it? It thrust a *concept* between the two. By so doing, it tore man *asunder*. Not content with this, it thereby tears society, i.e., itself, asunder, too. This tragedy took place in 1845.

The true socialists originally understood the unity of consumption and production to mean that activity shall itself involve enjoyment (for them, of course, a purely fanciful notion). According to Herr Grün's further definition of that unity, "consumption and production, economically speaking, must *coincide*" (p. 196); there must be no surplus of products over and above the immediate needs of consumption, which means, of course, the end of any movement whatsoever. With an air of importance, he therefore reproaches Fourier with wishing to *disturb* this unity by *over-production*. Herr Grün forgets that over-production causes crises only through its influence on the exchange value of products and that not only with Fourier but also in Herr Grün's perfect world exchange value has disappeared. All that one can say of this philistine rubbish is that it is worthy of true socialism.

With the utmost complacency, Herr Grün repeats again and again his commentary on the true socialist theory of production and consumption. For example, he tells us in the course of a discussion of Proudhon:

"Preach the social freedom of the consumers and you will have true equality of production" (p. 433).

Preaching this is an easy matter! All that has hitherto been wrong has been that

"consumers have been uneducated, uncultured, they do not all consume in a human way" (p. 432). "The view that consumption is the measure of production, instead of the contrary, is the death of every hitherto existing economic theory" (ibid.). "The real solidarity of mankind, indeed, bears out the truth of the proposition that the consumption of each presupposes the consumption of all" (ibid.).

Within the competitive system, the consumption of each presupposes more or less continuously the consumption of all, just as the production of each presupposes the production of all. It is merely a question of *how,* in what way, this is so. Herr Grün's only answer to this is the moral postulate of *human* consumption, the recognition of the "essential nature of consumption" (p. 432). Since he knows nothing of the real relations of production and consumption, he has to take refuge in human essence, the last hiding-place of the true socialists. For the same reason, he insists on proceeding from consumption instead of from production. If you proceed from production, you necessarily concern yourself with the real conditions of production and with the productive activity of men. But if you proceed from consumption, you can set your mind at rest by merely declaring that consumption is not at present "human", and by postulating "human consumption", education for true consumption and so on. You can be content with such phrases, without bothering at all about the real living conditions and the activity of men.

It should be mentioned in conclusion that precisely those economists who took consumption as their starting-point happened to be reactionary and ignored the revolutionary element in competition and large-scale industry.

The “Limitations of Papa Cabet” and Herr Grün

Herr Grün concludes his digression on the school of Fourier and on Herr Reybaud with the following words:

“I wish to make the organisers of labour conscious of their essence, I wish to show them historically where they have sprung front ... these hybrids ... who cannot claim as their own even the least of their thoughts. And later, perhaps, I shall find space to make an example of Herr Reybaud, not only of Herr Reybaud, but also of Herr Jay. The former is, in reality, not so bad, he is merely stupid; but the latter is more than stupid, he is learned. "And so”... (p. 260).

The gladiatorial posture into which Herr Grün throws himself, his threats against Reybaud, his contempt for learning, his resounding promises, these are all sure signs that something portentous is stirring within him. Fully “conscious of his essence” as we are, we infer from these symptoms that Herr Grün is on the point of carrying out a most tremendous plagiaristic coup. To anyone who has had experience of his tactics, his bragging loses all ingenuousness and turns out to be always a matter of sly calculation.

“And so":

A chapter follows headed:

“The Organisation of Labour!"

Where did this thought originated — In France. — But how?”

it is also labelled:

“Review of the Eighteenth Century.”

“Where did this” chapter of Herr Grün’s “originate? — In France. — But how?” The reader will find out without delay.

it should not be forgotten that Herr Grün wants to make the French organisers of labour [16] conscious of their essence by an historical exposition in the profound German style.

And so.

When Herr Grün realised that Cabet “had his limitations” and that his “mission had been completed long ago” (which he had known for a long time), it did not, “of course, mean an end of everything”. On the contrary, by arbitrarily selecting a few quotations from Cabet and stringing them together he laid upon Cabet the new mission: to provide the French “background” to Herr Grün’s German history of socialist development in the eighteenth century.

How does he set about his task? He reads “*productively*”.

The twelfth and thirteenth chapters of Cabet's *Voyage en Icarie* contain a motley collection of the opinions of ancient and modern authorities in favour of communism. He does not claim that he is tracing an historical movement. The French bourgeois view communism as a suspicious character. Good, says Cabet, in that case, men of the utmost respectability from every age will testify to the good character of my client; and Cabet proceeds exactly like a lawyer. Even the most adverse evidence becomes in his hands favourable to his client. One cannot demand historical accuracy in a legal defence. If a famous man happens to let fall a word against money, or inequality, or wealth, or social evils, Cabet seizes upon it, begs him to repeat it, puts it forward as the man's declaration of faith, has it printed, applauds it and cries with ironic good humour to his irritated bourgeois: "Hear what he has to say! Was he not a communist?"' No one escapes him. Montesquieu, Sieyès, Lamartine, even Guizot — communists all *malgré eux*. *Voilà* the communist all complete!

Herr Grün, in a productive mood, reads the quotations collected by Cabet, representing the eighteenth century; he never doubts for a moment the essential rightness of it all; he improvises for the benefit of the reader a mystical connection between the writers whose names happen to be mentioned by Cabet on one page, pours over the whole his Young-German literary slops and then gives it the title which we saw above.

And so.

Herr Grün:	*Cabet:*
Herr Grün introduces his review with the following words:	Cabet introduces his quotations with the following words:
"The social idea did not fall from heaven, it is organic, i.e., it arose by a process of gradual development. I cannot write here its complete history, I cannot commence with the Indians and the Chinese and proceed to Persia, Egypt and Judaea. I cannot question the Greeks and Romans about their social consciousness, I cannot take the evidence of Christianity, Neo-Platonism and patristic philosophy,[17] I cannot listen to what the Middle Ages and the Arabs have to say, nor can I examine the Reformation and philosophy during the period of its awakening and so on up to the eighteenth century" (p. 261).	***"You claim, foes of common ownership, that there is but a scanty weight of opinion in its favour. Well then, before your very eyes, I am going to take the evidence of history and of every philosopher. Listen! I shall not linger to tell you of those peoples of the past who practised community of goods! Nor shall I linger over the Hebrews ... nor the Egyptian priesthood, nor Minos ... Lycurgus and Pythagoras.... I shall make no mention of Confucius, nor of Zoroaster, who proclaimed, the one in China, the other in Persia ... this principle."***

After the passages given above, Cabet investigates Greek and Roman history, takes the evidence of Christianity, of Neo-Platonism, of the Fathers of the Church, of the Middle Ages, of the Reformation and of philosophy during the period of its awakening. Cf. Cabet, pp. 471-82. Herr Grün leaves others "more patient than himself" to copy these eleven pages, "provided the dust of erudition has left them the necessary humanism to do so" (that is, to copy them). (Grün, p. 261.) Only the social consciousness of the Arabs belongs to Herr Grün. We await longingly the disclosures about it which he has to offer the world. "I must restrict myself to the eighteenth century." Let us follow Herr Grün into the eighteenth century, remarking only that Grün underlines almost the very *same words* as Cabet.

Herr Grün:	*Cabet:*
"Locke, the founder of sensationism, observes: He whose possessions exceed his needs, oversteps the bounds of reason and of original justice and steals that which belongs to others. *Every surplus is usurpation*, and the sight of the needy must awaken remorse in the soul of the wealthy. Corrupt men, you who roll in luxury and pleasures, tremble lest one day the wretch who lacks the necessities of life *shall truly come to know the rights of man*. Fraud, faithlessness and avarice have produced that inequality of possessions *which is the great misfortune of the human race* by piling up all sorts of sufferings, on the one hand, beside riches, on the other, beside destitution. *The philosopher must, therefore, regard the use of money as one of the most*	"But here we have Locke, who exclaims in his admirable *Civil Government*: 'He who possesses in excess of his needs, oversteps the bounds of reason and of original justice and *appropriates the property of others*. All *excess* is *usurpation*, and the sight of the needy ought to awaken remorse in the soul of the wealthy. Perverse men, you who roll in riches and pleasures, tremble lest one day the wretch. who lacks the necessities of life truly apprehend the *rights of man*.' Heat. him exclaim again: 'Fraud, bad faith, avarice have produced that *inequality of means*, which, by piling on the one hand wealth and vice and on the other poverty and suffering, constitutes *the great misfortune of the human race*.... The philosopher must, therefore, regard the use of *money* as one of the most fatal inventions of human industry." (p. 485).

pernicious inventions of human industry" (p. 266).

Herr Grün concludes from these quotations of Cabet's that Locke is "an opponent of the monetary system" (p. 264), "a most outspoken opponent of money and of all property which exceeds the limits of need" (p. 266). Locke was, unfortunately, one of the first scientific champions of the monetary system, a most uncompromising advocate of the flogging of vagabonds and paupers, one of the doyens of modern political economy.

Herr Grün:	*Cabet:*
"Already Bossuet, the Bishop of Meaux, says in his *Politics Derived from Holy Scripture*: 'Without governments' ('without politics' — an absurd interpolation on the part of Herr Grün) 'the earth with all its goods would be the common property of men, just as much as air and light; no man, according to the original law of nature, has a particular right to anything. *All things belong to all men; it is from civil government that property results.*' A priest in the seventeenth century has the honesty to say such things as these; to express such views as these! And the German *Puffendorf*, whom one" (i.e., Herr Grün) "knows only through one of Schiller's epigrams,' was of the following opinion: '*The present inequality of means is an injustice* which involves all other inequalities by reason of the insolence of the rich and the *cowardice* of the poor'" (p. 270). Herr Grün adds: "We shall	"Listen to Baron von *Puffendorf*, a professor of natural law in Germany and a Councillor of State in Stockholm arid Berlin, a man who in his law of nature and nations refutes the doctrine of Hobbes and Grotius concerning absolute monarchy, who proclaims natural equality, fraternity, and primitive community of goods, and who recognises property to be a human institution, the result of a distribution of goods, by common consent, to the end that all, and particularly the workers, may be assured of permanent possession, undivided or divided, and that, in consequence, the existing inequality of possessions is an *injustice* which only involves the other inequalities in consequence of *the insolence of the rich and the cowardice of the poor.* "And does not *Bossuet,* the Bishop of Meaux, the preceptor of the French Dauphin, the famous Bossuet, recognise also

not digress; let us remain in France.”	in his *Politique tirée de l'Ecriture sainte* — written for the Dauphin — that, were it not for governments, the earth and all goods would be as *common* to men as air and light; according to the primary law of nature, no one has a particular right to *anything* — *, all things belong to all men* and it is from civil government that property springs.” (p. 486).

The substance of Herr Grün’s “digression” from France is that Cabet quotes a German. Grün even spells the German name in the incorrect French fashion. Apart from his occasional mistranslations and omissions, he surprises us by his improvements. Cabet speaks first of Puffendorf and then of Bossuet; Herr Grün speaks first of Bossuet and then of Puffendorf. Cabet speaks of Bossuet as a famous man; Herr Grün calls him a “priest”. Cabet quotes Puffendorf with all his titles; Herr Grün makes the frank admission that one knows him only from one of Schiller’s epigrams. Now he knows him also from one of Cabet’s quotations, and it is apparent that the Frenchman, with all his limitations, has made a closer study than Herr Gran not only of his own countrymen, but of the Germans as well.

Cabet says: “I must make haste to deal with the great philosophers of the eighteenth century; I shall begin with Montesquieu” (p. 487). In order to reach Montesquieu, Herr Grün begins with a sketch of the “legislative genius of the eighteenth century” (p. 282). Compare their various quotations from Montesquieu, Mably, Rousseau, Turgot. It suffices here to compare Cabet and Herr Grün on Rousseau and Turgot. Cabet proceeds from Montesquieu to Rousseau. Herr Grün constructs this transition: “Rousseau was the radical and Montesquieu the constitutional politician.”

Herr Grün quotes from *Rousseau:*	*Cabet:*
“The greatest evil has already been done when one has to defend the poor and restrain the rich, etc.”. ...... (ends with the words) “hence it follows that the social state is only advantageous to men if they all of them have something and none has too much.”	“Listen now to *Rousseau,* the author of the immortal *Social Contract* — listen: ‘Men are equal by right. Nature has made all goods common... it distribution takes place the share of each becomes his property. In all cases the sole proprietor of all goods is society.’ Listen again: ... ‘hence it

According to Herr Grün, Rousseau becomes “confused and quite vague when he has to answer the question: what transformation does the previous form of property undergo when primitive man enters into society? What does he answer? He answers: Nature has made all goods common” ... (ends with the words) “if a distribution takes place the share of each becomes his property” (pp. 284, 285).	follows that the social state is only advantageous to men inasmuch as they all have something and none has too much’. “Listen, listen again to Rousseau in his *Political Economy* [*Économie ou OEconomie (Morale et Politique)*]: ‘The greatest evil has already been done when one has to defend the poor and restrain the rich.” etc., etc. (pp. 489, 490).

Herr Grün makes two brilliant innovations:, firstly, he merges the quotations from the *Contrat social* and the *Économie politique* and, secondly, he begins where Cabet ends. Cabet names the titles of the writings of Rousseau from which he quotes, Herr Grün suppresses them. The explanation of these tactics is, perhaps, that Cabet is speaking of Rousseau’s *Économie politique*, which Herr Grün does not know, even from an epigram of Schiller. Although Herr Grün is conversant with all the secrets of the *Encyclopedia* (cf. p. 263), it was a secret for him that Rousseau’s *Économie politique* is none other than the article in the *Encyclopédie* on political economy.

Let us pass on to *Turgot*. Herr Grün is not content here with merely copying the quotations; he actually transcribes the sketch that Cabet gives of Turgot.

Herr Grün:	*Cabet:*
“One of the noblest and most futile attempts to establish a new order on the foundations of the old, everywhere on the point of collapse, was made by Turgot. It was in vain. The aristocracy brought about an artificial famine, instigated revolts, intrigued and spread calumnies against him until the debonair Louis dismissed his Minister. — The aristocracy would not listen, therefore, it	“Yet while the King declared that he and his Minister (Turgot) were the only friends the people had at court, while the people heaped blessings upon him, while the philosophers overwhelmed him with admiration, while Voltaire wished to kiss before he died the hand which had signed so many improvements for the people, the aristocracy conspired against him, even organised a vast famine, and stirred up

had to suffer. Human development always avenges fearfully those good angels who utter the last urgent warning before a catastrophe. The French people blessed Turgot, Voltaire wished to kiss his hand before he died, the King had called him his friend.... Turgot, the Baron, the Minister, one of the last feudal lords, pondered the idea that a domestic press ought to be invented so as to make freedom of the press completely secure" (pp. 289, 290).	insurrections in order to destroy him; by its intrigues and calumnies it succeeded in turning the Paris salons against the reformer and in destroying Louis XVI himself by forcing him to dismiss the virtuous Minister who would have saved him." "Let us return to Turgot, a Baron, a Minister of Louis XVI during the first year of his reign, one who desired to reform abuses, who carried through a mass of reforms, who wished to establish a new language; a man who actually tried to invent a domestic press in order to ensure the freedom of the press." (p. 495).

Cabet calls Turgot a Baron and a Minister, Herr Grün copies this much from him, but by way of improving on Cabet, he changes the youngest son of the prévôt of the Paris merchants into "one of the *oldest* of the feudal lords". Cabet is wrong in attributing the famine and the uprising of 1775[18] to the machinations of the aristocracy. Up to the present, no one has discovered who was behind the outcry about the famine and the movement connected with it. But in any case the parliaments and popular prejudice had far more to do with it than the aristocracy. It is quite in order for Herr Grün to copy this error of "poor limited Papa" Cabet. He believes in him as in a gospel. On Cabet's authority Herr Grün numbers Turgot among the communists, Turgot, one of the leaders of the physiocratic school, the most resolute champion of free competition, the defender of usury, the mentor of Adam Smith. Turgot was a great man, since his actions were in accordance with the time in which he lived and not with the illusions of Herr Grün, the origin of which we have shown already.

Let us now pass to the men of the French Revolution. Cabet greatly embarrasses his bourgeois opponent by numbering Sieyès among the forerunners of communism, by reason of the fact that he recognised equality of rights, and considered that only the state sanctions property (Cabet, pp. 499-502). Herr Grün, who "is fated to find the French mind inadequate and superficial every time that he comes into close contact with it", cheerfully copies this, and imagines that an old party leader like Cabet is destined to preserve the "humanism" of Herr Grün from "the dust of erudition". Cabet continues: "*Ecoutez le fameux Mirabeau!*" (p. 504). Herr Grün says:

“Listen to Mirabeau!” (p. 292) and quotes some of the passages stressed by Cabet, in which Mirabeau advocates the equal division of bequeathed property among brothers and sisters. Herr Grün exclaims: “Communism for the family!” (p. 292). On this principle, Herr Grün could go through the whole range of bourgeois institutions, finding in all of them traces’ of communism, so that taken as a whole they could be said to represent perfect communism. He could christen the *Code Napoléon* a *Code de la communauté*! And he could discover communist colonies in the brothels, barracks and prisons.Let us conclude these tiresome quotations with *Condorcet.* A comparison of the two books will show the reader very clearly that Herr Grün now omits passages, now merges them, now quotes titles, now suppresses them, leaves out the chronological dates but meticulously follows Cabet’s order, even when Cabet does not proceed strictly in accordance with chronology, and he achieves in the end nothing more than an abridgement of Cabet, poorly and timidly disguised.

Herr Grün:	*Cabet:*
“*Condorcet* is a radical Girondist. He recognises the injustice of the distribution of property, he absolves the poor from blame ... if the people are somewhat dishonest on principle, the cause lies in the institutions themselves.	“Listen to *Condorcet*, who maintained in his reply to the Berlin Academy” ... “'It is therefore entirely because the institutions are evil that the people are so frequently a little dishonest on principle.'
“In his journal, *Social Education* he even tolerates large-scale capitalists	“Listen to what he has to say in his journal *L'instruction sociale* ... he even tolerates large-scale capitalists.” etc
"Condorcet moved that the Legislative Assembly should divide the 100 millions owned by the three princes who emigrated into 100,000 parts he organises education and the *establishment* of public assistance” (cf. the original text).	"Listen to one of the Girondist leaders, the philosopher Condorcet, from the tribune of the Legislative Assembly, on the 6th July, 1792: ‘Decree that the possessions of the three French princes (Louis XVIII, Charles X and the Prince of Condé) be immediately put up for sale ... they amount to almost 100 millions, and you will replace three princes by 100 thousand citizens ... organise education

	and institutions for public assistance.'
“In his report on public education to the Legislative Assembly, Condorcet says: ‘The object of education and the duty of the political authorities ... is to offer every member of the human race the means of satisfying his needs, etc."” (Herr Grim changes the report of the Committee on Condorcet’s plan into a report by Condorcet himself.) (Grün, pp. 293, 294.)	“But listen to the Committee of Public Education, presenting to the Legislative Assembly on the 20th April, 1792 its report on the plan of education drawn up by Condorcet: ‘Public education should offer to every individual the means of providing for his needs ... such ought to be the first aim of national education and from this point of view it is a duty which justice demands of the political authorities."”, etc. (pp. 502, 503, 505, 509).

By this shameless copying from Cabet, Herr Grün, using the historical method, endeavours to make the French organisers of labour conscious of their essence; he proceeds moreover according to the principle: *Divide et impera*. He unhesitatingly interpolates among his quotations his definitive verdict on persons whose acquaintance he made a moment ago by reading a passage about them; then he inserts a few phrases about the French Revolution and divides the whole into two halves by the use of a few quotations from Morelly. Just at the right moment for Herr Grün Morelly was *en vogue* in Paris, through the efforts of Villegardelle; and the most important passages from Morelly’s work had been translated in the Paris *Vorwärts!* long before Herr Grün came upon the scene. We shall adduce only one or two glaring examples of Herr Grün’s slipshod method of translation.

Morelly:

“Self-interest perverts the heart and embitters our dearest ties, transforming them into heavy chains, which in our society married couples detest and at the same time detest themselves.

Herr Grün:

“Self-interest renders the heart unnatural and embitters the dearest ties, transforming them into heavy chains, which our married people detest and they detest themselves into the bargain” (p. 274).

Utter nonsense. Morrelly:

“Our soul contracts such a terrific thirst that it chokes in quenching it “'

Herr Grün:

"Our soul ... contracts ... so furious a thirst that it suffocates itself in order to quench it" (ibid.).

Again utter nonsense. *Morelly*:

"Those who claim to control our morals and dictate our laws."

Herr Grün:

"Those who *pretend* to control our morals and dictate our laws", etc. (p. 275).

All three mistakes occur in a single passage of Morelly which takes up fourteen lines in Herr Grün's book. In his exposition of Morelly there are also numerous plagiarisms from Villegardelle. Herr Grün is able to sum up all his knowledge of the eighteenth century and of the Revolution in the following lines:

"Sensualism, deism and theism together stormed the old world. The old world crumbled. When a new world came to be built, deism was victorious in the Constituent Assembly, theism in the Convention, while pure sensualism was beheaded or silenced" (p. 263).

Here we have the philosophic habit of dismissing history with a few categories proper to ecclesiastical history; Herr Grün reduces it to its basest form, to a mere literary phrase, which serves only to adorn his plagiarisms. *Avis aux philosophes!'* [a warning to the philosophers!]

We skip Herr Grün's remarks about communism. His historical notes are copied from Cabet's brochures, and the *Voyage en Icarie* is viewed from the standpoint adopted by true socialism (cf. *Bürgerbuch* and *Rheinische Jahrbücher* [Karl Grün, "Feuerbach und die Socialisten" and "Politik und Sozialismus"]). Herr Grün shows his knowledge of French, and at the same time of English, conditions by calling Cabet the "communist O'Connell of France" (p. 382), and then says:

"He would be ready to have me hanged if he had the power and knew what I think and write about him. These agitators are dangerous for men such as us, because their *intelligence is limited*" (p. 382).

Proudhon

Herr Stein revealed his intellectual poverty in no uncertain way by treating Proudhon en bagatelle" (cf. Einundzwanzig Bogen, p. 84 [Moses Hess, "Socialismus und Communismus"]). "One needs something more than Hegel's old twaddle to follow this logic incarnate" (p. 411).

A few examples may show that Herr Grün remains true to his nature in this section too. He translates (on pages 437-44) several excerpts from the economic arguments adduced by Proudhon to prove that property is intolerable and finally exclaims:

"To this critique of property, which is the complete liquidation of property, we need add nothing. We have no desire to write a new critique, abolishing in its turn equality of production and the isolation of equal workers. I have already in an earlier passage indicated what is necessary. The rest" (that is, what Herr Grün has not indicated) "we shall see when society is rebuilt, when true property relations are established" (p. 444).

In this way Herr Grün tries to avoid a close investigation of Proudhon's economic arguments and, at the same time, to rise superior to them. Proudhon's whole set of proofs is wrong; however, Herr Grün will realise that, as soon as someone else has proved it.

The comments on Proudhon made in *Die heilige Familie* — in particular those stressing that Proudhon criticises political economy from the standpoint of political economy, and law from the legal standpoint — are copied by Herr Grün. But he has understood so little of the problem that he omits the essential point, [namely] that Proudhon vindicates the *illusions* cherished by jurists and economists [as against] their practice; with regard to the foregoing statement he produces a set of nonsensical [phrases].

The most important thing in Proudhon's book *De la création de l'ordre dans l'humanité* is his *dialectique sérielle,* the attempt to establish a method of thought in which the *process* of thinking is substituted for independent thoughts. Proudhon is looking, from the French standpoint, for a dialectic method such as Hegel has indeed given us. A relationship with Hegel therefore exists here really and does not need to be constructed by means of some imaginative analogy. It would have been an easy matter to offer a criticism of Proudhon's dialectics if the criticism of Hegel's had been mastered. But this was hardly to be expected of the true socialists, since the philosopher Feuerbach himself, to whom they lay claim, did not manage to produce one. Herr Grün makes a highly diverting attempt to shirk his task. At the very moment when he should have brought his heavy German artillery into play, he decamps with an indecent gesture. First of all he fills several pages with translations, and then explains to Proudhon, with boisterous literary *capiatio benevolentiae*, [attempt to win good will] that his *dialectique sérielle* is merely an excuse for *showing off his learning.* He does indeed try to console Proudhon by addressing him as follows:

“Ah, my dear friend, make no mistake about being a man of learning” (or “tutor”). “We have had to forget everything that our school-masters and our university hacks” (with the exception of Stein, Reybaud and Cabet) “have tried to impart to us with such infinite labour and to our mutual disgust” (p. [457]).

As a proof that now Herr Grün no longer absorbs knowledge with such infinite labour”, although perhaps with just as much “disgust”, we may note that he begins his socialist studies and letters in Paris on November 6th [and] by the following January 20th has “inevitably” [not] only concluded his *studies* but has also finished the [exposition of] his

“really complete impression of the entire process”.

V. “Doctor Georg Kuhlmann Of Holstein” Or The Prophecies of True Socialism

The New World*, or *The Kingdom of the Spirit upon Earth. Annunciation [19]

“A man was needed” (so runs the preface) “who would give utterance to all our sorrows, all our longings and all our hopes, to everything, in a word, which moves our age most deeply. And in the midst of this stress and turmoil of doubt and of longing he had to emerge from the solitude of the spirit bearing the solution of the riddle, the living symbols of which encompass us all. This man, whom our age was awaiting, has appeared. He is Dr. Georg Kuhlmann of Holstein.”

August Becker, the writer of these lines, thus allowed himself to be persuaded, by a person of a very simple mind and very ambiguous character, that not a single riddle has yet been solved, not a single vital energy aroused — that the communist movement, which has already gripped all civilised countries, is an empty nut whose kernel cannot be discovered; that it is a universal egg, laid by some great universal hen without the aid of a cock — whereas the true kernel and the true cock of the walk is Dr. Georg Kuhlmann of Holstein!...

This great universal cock turns out, however, to be a perfectly ordinary capon who has fed for a while on the German artisans in Switzerland and who cannot escape his due fate.

Far be it from us to consider Dr. Kuhlmann of Holstein to be a commonplace charlatan and a cunning fraud, who does not himself believe in the efficacy of his elixir of life and who merely applies his science of longevity to the preservation of life in his own body — no, we are well aware that the inspired doctor is a *spiritualistic* charlatan, a *pious* fraud, a *mystical* old fox, but one who, like all his kind, is none too scrupulous in his choice of means, since his own person is intimately connected with his sacred mission. Indeed, sacred missions are always intimately bound up with the holy beings who pursue them; for such missions are of a *purely* idealistic nature and exist *only* in the *mind.* All idealists, philosophic and religious, ancient and modern, believe in inspirations, in revelations, saviours, miracle-workers; whether their belief takes a crude, religious, or a refined, philosophic, form depends only upon their cultural level, just as the degree of energy which they possess, their character, their social position, etc., determine whether their attitude to a belief in miracles is a passive or an active one, i.e., whether they are shepherds performing miracles or whether they are sheep; they further determine whether the aims they pursue are theoretical or practical.

Kuhlmann is a very energetic person and a man of some philosophic education; his attitude to miracles is by no means a passive one and the aims which he pursues are very practical.

All that August Becker has in common with him is the national infirmity of mind. The good fellow

"pities those who cannot bring themselves to see that the will and the ideas of an age can only he expressed by individuals".

For the idealist, every movement designed to transform the world exists only in the head of some chosen being, and the fate of the world depends on whether this head, which is endowed with all wisdom as its own private property, is or is not mortally wounded by some realistic stone before it has had time to make its revelation.

"Or is this not the case?" adds August Becker defiantly. "Assemble all the philosophers and the theologians of the age, let them take counsel and register their votes, and then see what comes of it all!"

The whole of historical development consists, according to the ideologist, in the theoretical abstractions of that development which have taken shape in the "heads" of all "the philosophers and theologians of the age", and since it is impossible to "assemble" all these "heads" and induce them to "take counsel and register their votes", there must of necessity be one sacred head, the apex of all these philosophical and theological heads, and this *top head* is the speculative *unity* of all these *block-heads* — the saviour. This "cranium" system is as old as the Egyptian pyramids, with which it has many similarities, and as new as the Prussian monarchy, in the capital of which it has recently been resurrected in a rejuvenated form. The idealistic Dalai Lamas have this much in common with their real counterpart: they would like to persuade themselves that the world from which they derive their subsistence could not continue without their holy excrement. As soon as this idealistic folly is *put into practice,* its *malevolent* nature is apparent: its clerical lust for power, its religious fanaticism, its charlatanry, its pietistic hypocrisy, its unctuous deceit. Miracles are the *asses' bridge* leading from the kingdom of the idea to *practice*. Dr. Georg Kuhlmann of Holstein is just such an asses' bridge — he is inspired — his magic words cannot fail to move the most stable of mountains. How consoling for those patient creatures who cannot summon up enough energy to blast these *mountains* with *natural powder*! What a source of confidence to the blind and timorous who cannot see the material coherence which underlies the diverse scattered manifestations of the revolutionary movement!

"There has been lacking, up to now, a rallying point," says August Becker.

Saint George overcomes all concrete obstacles with the greatest of ease by transforming — all concrete things into ideas; he then pronounces himself the speculative unity of the latter, and this enables him to "rule and regulate them":

"The society of ideas is the world. And their unity regulates and rules the world" (p. 138).

Our prophet wields all the power he can possibly desire in this "*society of ideas*".

"Led by our own idea, we will wander, hither and thither, and contemplate everything in the minutest detail, as far as our time requires" (p. 138).

What a speculative unity of nonsense!

But paper is long-suffering, and the German public, to whom the prophet issued his oracular pronouncements, knew so little of the philosophic development in its own country that it did not even notice how, in his speculative oracular pronouncements, the great prophet merely reiterated the most decrepit philosophic phrases and adapted them to his practical aims.

Just as medical miracle-workers and miraculous cures are made possible by ignorance of the laws of the *natural* world, so social miracle-workers and miraculous social cures depend upon ignorance of the laws of the *social* world — and the witch-doctor of Holstein is none other than the *socialistic miracle-working shepherd* of Niederempt.

The first revelation which this miracle-working shepherd makes to his flock is as follows:

"I see before me an assembly of the elect, who have gone before me to work by word and deed for the salvation of our time, and who are now come to hear what I have to say concerning the weal and woe of mankind."

"Many have already spoken and written in the name of mankind, but none has yet given utterance to the real nature of man's suffering, his hopes and his expectations, nor told him how he may obtain his desires. That is precisely what I shall do."

And his flock believes him. There is not a single original thought in the whole work of this "Holy Spirit"; he reduces out-of-date socialistic theories to abstractions of the most sterile and general kind. There is nothing original even in the form, the style. Others have imitated more happily the sanctified style of the Bible. Kuhlmann has taken Lamennais' manner of writing as his model, but he merely achieves a caricature of Lamennais. We shall give our readers a sample of the beauties of his style:

"Tell me, firstly,, how feel ye when ye think of your eternal lot?

"Many indeed mock and say: 'What have I to do with eternity?'

"Others rub their eyes and ask: 'Eternity — what may this be?...'

"How feel ye, when ye think of the hour when the grave shall swallow you up?"

"And I hear many voices." One among them speaks in this wise:

"Of recent years it bath been taught that the spirit is eternal, that in death it is only dissolved once more in God, from whom it proccedeth. But they who preach such things cannot tell me what then remaineth of me. Oh, that I had never seen the light of day. And assuming that I do not die — oh, my parents, my sisters, my brothers, my children, and all whom I love, shall I ever see You again! Oh, had I but never seen you!" etc.

"How feel ye, further, if ye think of infinity?" ...

We feel very poorly, Herr Kuhlmann — not at the thought of *death,* but at your *fantastic idea* of death, at your *style*, at the *shabby* means you employ to work upon the *feelings* of others.

"How dost feel," dear reader, when you hear a *priest* who paints hell very hot to terrify his sheep and make their minds very flabby, a priest whose eloquence only aims at stimulating the *tear glands* of his hearers and who speculates only on the *cowardice* of his congregation?

As far as the meagre *content* of the "Annunciation" is concerned, the first section, or the introduction to the *Neue Welt,* can be reduced to the simple thought that Herr *Kuhlmann* has come from Holstein to found the "Kingdom of the Spirit", the "*Kingdom of Heaven*" upon earth; that he was the first to know the real hell and the real heaven — the former being society as it has hitherto existed and the latter being future society, the "Kingdom of the Spirit" — and that he himself is the longed-for holy "spirit......

None of these great thoughts of Saint George are exactly original and there was really no need for him to have bothered to come all the way from Holstein to Switzerland, nor to have descended from the „solitude of the spirit" to the level of the artisans, nor to have "revealed" himself, merely in order to present this "vision" to the "world".

However, the idea that Dr. *Kuhlmann of Holstein's* the "longed-for "holy spirit" is his own exclusive property — and is likely to remain so.

According to Saint George's own "revelation", his Holy Scripture will progress in the following way:

"It will reveal" (he says) "the Kingdom of the Spirit in its earthly guise, that ye may behold its glory and see that there is no other salvation but in the Kingdom of the Spirit. On the other hand, it will expose your vale of tears that ye may behold your wretchedness and know the cause of all your sufferings. Then I shall show the way which leads from this sorrowful present to a joyful future. To this end, follow me in the spirit to a height, whence we may have a free prospect over the broad landscape."

And so the prophet permits us first of all a glimpse of his "*beautiful* landscape", his *Kingdom of Heaven.* We see nothing but a misunderstanding of Saint-Simonism, wretchedly staged, with costumes that are a travesty of Lamennais, embellished with fragments from Herr Stein. We shall now quote the most important revelations from the *Kingdom of Heaven,* which demonstrate the prophetic method. For example, page 37:

"The choice is free and depends on each person's inclinations. Inclinations depend on one's natural faculties." "If in society," Saint George prophesies, "everyone follows his inclination, all the developed and if this is so, that which all faculties of society without exception will be need will

continually be produced, in the realm of the spirit as in the realm of matter. For society always possesses as many faculties and energies as it has needs........ Les attractions sont proportionelles aux Destinies" (cf. also Proudhon).

Herr Kuhlmann differs here from the socialists and the communists only by reason of a *misunderstanding*, the cause of which must be sought in his pursuit of *practical aims* and undoubtedly also in his narrow-mindedness. He confuses the *diversity* of faculties and capacities with the *inequality* of *possessions* and of *enjoyment* conditioned by possession, and *inveighs* therefore against *communism.*

"No one shall have there" (that is, under communism) "any advantage over another", declaims the prophet, "no one shall have more possessions and live better than another.... And if you cherish doubts about it and fail to join in their vociferation, they will abuse you, condemn you, and persecute you and hang you on a gallows" (p. 100).

Kuhlmann sometimes prophesies quite correctly, one must admit.

"In their ranks then are to be found all those who cry: Away with the Bible! Away, above all, with the Christian religion, for it is the religion of humility and servility! Away with all belief whatsoever! We know nothing of God or immortality! They are but figments of the imagination, exploited and continually concocted by deceivers and liars for their advantage" (it should read: which are exploited by the priests for their advantage). "In sooth, he who still believes in such things is the greatest of fools!"

Kuhlmann attacks with particular vehemence those who are on principle opposed to the doctrine of *faith, humility* and *inequality*, i.e., the doctrine of "*difference of rank and birth*". His socialism is based on the abject doctrine of predestined slavery — which, as formulated by Kuhlmann, reminds one strongly of *Friedrich Rohmer* — on the theocratic hierarchy and, in the last instance, on his *own sacred person!*

"Every branch of labour," we find on page 42, "is directed by the most skilled worker, who himself takes part in it, and in the realm of enjoyment every branch is guided by the merriest member, who himself participates in the enjoyment. But, as society is undivided and possesses only one mind, the whole system will he regulated and governed by one man — and he shall be the wisest, the most virtuous and the most blissful."

On page 34 we learn:

"If man strives after virtue in the spirit, then he stirs and moves his limbs and develops and moulds and forms everything in and outside himself according to his pleasure. And if he experiences well-being in the spirit, then he must also experience it in everything that lives in him. Therefore, man eats and drinks and takes delight therein: therefore, he sings, plays and dances, he kisses, weeps and laughs."

The knowledge of the influence which the *vision of God* exerts on the *appetite,* and which *spiritual blissfulness* exerts upon the *sex impulse* is, indeed, not the private property of Kuhlmannism; but it does shed light on *many an obscure passage* in the prophet. For example, page 36:

"Both" (possession and enjoyment) "correspond to his labour" (that is, to man's labour). "Labour is the measure of his needs." (In this way, Kuhlmann distorts the proposition that a communist society has, on the whole, always as many faculties and energies as needs.) "For labour is the expression of the ideas and the instincts. And needs are based on them. But, since the faculties and needs of men are always different, and so apportioned that the former can only be developed and the latter satisfied, if each continually labours for all and the product of the labour of all is exchanged and apportioned in accordance with the deserts" (?) "of each — for this reason each receives only the value of his labour."

The whole of this tautological rigmarole would be — like the following sentences and many others which we spare the reader — utterly *incomprehensible*, despite the "sublime *simplicity* and *clarity*" of the "revelation" so praised by A. Becker, if we had not a *key* in the shape of the *practical aims* which the prophet is pursuing. This makes everything at once comprehensible.

"Value," continues Herr Kuhlmann like an oracle, "determines itself according to the need of all." (?) "In value the work of each is always contained and for it" (?) "he can procure for himself whatever his heart desires." "See, my friends," runs page 39, "the society of true men always regards life as a school ... in which man must educate himself. And thereby it wants to attain bliss. But such" (?) "must become evident and visible" (?). "otherwise it" (?) "is impossible."

What Herr Georg Kuhlmann of Holstein has in view when he says that "such" (life? or bliss?) must "become evident" and "visible", because "it" would otherwise be "impossible" — that "labour" is "contained in value" and that one can procure for it (for what?) one's heart's desire — and finally, that "value" determines itself according to "need" — all this cannot be understood unless one once again takes into account the *crux* of the whole revelation, the *practical point* of it all.

Let us therefore try to offer a practical explanation.

We learn from August Becker that Saint George Kuhlmann of Holstein had no success in his own country. He arrives in Switzerland and finds there an entirely "new world", the communist societies of the German artisans. That is more to his taste — and he attaches himself without delay to communism and the communists. He always, as August Becker tells us, "worked unremittingly to develop his doctrine *further* and *to make it adequate* to the greatness of the times", i.e., he became a communist among the communists *ad majorem Dei gloriam*.

— On Inequality —

So far everything had gone well.

But one of the most vital principles of communism, a principle which distinguishes it from all reactionary socialism, is its empirical view, based on a knowledge of man's nature, that differences of brain and of intellectual ability do not imply any differences whatsoever in the nature of the *stomach* and of physical *needs*; therefore the false tenet, based upon existing circumstances, "to each according to his abilities", must be changed, insofar as it relates to enjoyment in its narrower sense, into the tenet, "*to each according to his need*"; in other words, a *different form* of activity, of labour, does not justify *inequality*, confers no *privileges* in respect of possession and enjoyment.

The prophet could not admit this; for the privileges, the advantages of his station, the feeling of being a chosen one, these are the very stimulus of the prophet.

"But such must become evident and visible, otherwise it is impossible."

Without practical advantages, without some *tangible stimulus*, the prophet would not be a prophet at all, he would not be a *practical*, but only a *theoretical,* man of God, a *philosopher*. The prophet must, therefore, make the communists understand that different forms of *activity* or *labour* give the right to different degrees of *value* and of *bliss* (or of enjoyment, merit, pleasure, it is all the same thing), and since each determines his own *bliss* and his *labour*, therefore, *he*, the prophet — this is the practical point of the revelation — can claim a *better life* than the *common artisan*. [The prophet has moreover *openly* stated this in a lecture which has not been printed.]

After this, all the prophet's obscure passages become clear: that the "possession" and "enjoyment" of each should correspond to his "labour"; that the "labour" of each man should be the measure of his "*needs*"; that, therefore, each should receive the "value" of his labour; that "value" will determine *itself* according to "need" ; that the work of each is "contained" in value and that he can procure for it what his "heart" desires; that, finally, the "bliss" of the chosen one must "become evident and visible", because it is otherwise "impossible". All this nonsense has now become intelligible.

We do not know the exact extent of the practical demands which Dr. Kuhlmann really makes upon the artisans. But we do know that his doctrine is a dogma fundamental to all spiritual and temporal craving for power, a mystic veil which is used to conceal all hypocritical pleasure-seeking; it serves to extenuate any infamy and is the source of many incongruous actions.

We must not omit to show the reader the way which, according to Herr Kuhlmann of Holstein, "leads from this sorrowful present to a joyful future". This way is lovely and delightful as spring in a flowery meadow or as a flowery meadow in spring.

"Softly and gently, with sun-warmed fingers, it puts forth buds, the buds become flowers, the lark and the nightingale warble, the grasshopper in the grass is roused. Let the new world come like the spring" (p. 114 et seq.).

The prophet paints the transition from present social isolation to communal life in truly idyllic colours. just as he has transformed real society into a "society of ideas", so that "led by his own idea he should be able to wander hither and thither, and contemplate everything in the minutest detail, as far as his time requires", so he transforms the real social movement which, in all civilised countries, already proclaims the approach of a terrible social upheaval into a process of *comfortable* and *peaceful conversion*, into a *still life* which will permit the owners and rulers of the world to slumber *peacefully*. For the idealist, the *theoretical abstractions* of real events, their ideal signs, are *reality*; *real events* are merely "sign that the old world is going to its doom".

"Wherefore do ye strive so anxiously for the things of the moment," scolds the prophet on page 118, "they are nothing more than signs that the old world is going to its doom; and wherefore do ye dissipate your strength in strivings which cannot fulfil your hopes and expectations?"

"Ye shall not tear down nor destroy that which ye find in your path, ye shall rather shun it and abandon it. And when ye have shunned it and abandoned it, then it shall cease to exist of itself, for it shall find no other nourishment."

"If ye seek truth and spread light abroad, then lying and darkness will vanish from your midst" (p. 116).

"But there will be many who will say: 'How shall we build a new life as long as the old order prevails and hinders us? Must it not first be destroyed?' 'By no means,' answers the wisest, the most virtuous and the most blissful man. 'By no means. If ye dwell with others in a house' that has become rotten and is too small and uncomfortable for you, and the others wish to remain in it, then ye shall not pull it down and dwell in the open, but ye shall first build a new house, and when it is ready ye shall enter it and abandon the old to its fate"' (p. 120).

The prophet now gives two pages of rules as to how one can *insinuate* oneself into the new world. Then he becomes aggressive:

"But it is not enough that ye should stand together and forsake the old world — ye shall also take up arms against it to make war upon it and to extend your kingdom and strengthen it. Not by the use of force, however, but rather by the use of free persuasion."

But if *nevertheless* it comes about that one has to take up a *real* sword and hazard one's *real* life "to conquer heaven by force", the prophet promises his sacred host a Russian immortality (the Russians believe that they will rise again in their respective localities if they are killed in battle by the enemy):

"And they who shall fall by the wayside shall be born anew and shall rise more beauteous than they were before. Therefore" (therefore) "take no thought for your life and fear not death" (p. 129).

Even in a conflict with real weapons, says the prophet reassuringly to his sacred host, you do not *really* risk your life; you merely pretend to risk it. The prophet's doctrine is in every sense *sedative*. After these samples of his Holy Scripture one cannot wonder at the applause it has met with among certain *easy-going slowcoaches*.

Footnotes

1. A reference to the writers of *Young Germany* (*Junges Deutschland*) — a literary group that emerged in Germany in the 1830s and was influenced by Heinrich Heine and Ludwig Börne. The Young Germany writers (Karl Gutzkow, Ludolf Wienbarg, Theodor Mundt and others) came out in defence of freedom of conscience and the press. Their writings reflected opposition sentiments of the petty bourgeoisie and intellectuals. The views of the Young Germans were politically vague and inconsistent; soon the majority of them turned into mere liberals
2. ↑ The *Levellers* were a democratic-republican trend in the English bourgeois revolution of the mid-17th century. The reference in the text is probably to the most radical section of the Levellers known as True Levellers, or Diggers. The Diggers represented the poorest strata that suffered both from feudal and capitalist exploitation in the town and the countryside. In contrast to the mass of the Levellers, who wanted to retain private property, the Diggers advocated common property and other ideas of equalitarian communism
3. ↑ *National reformers* — members of the National Reform Association founded in the U.S.A. in 1845. The Association, which consisted mainly of artisans and workers, and declared that every worker should have the right to a piece of land free of charge, started a campaign for a land reform against the slave-owning planters and land speculators. It also put forward a number of other democratic demands such as abolition of the standing army, abolition of slavery and introduction of the ten-hour working day
4. ↑ *Humaniora* (humanities) — the subjects the study of which was considered essential for the knowledge of ancient classical culture; the humanists of the Renaissance and their followers regarded these subjects as the basis of humanistic education
5. ↑ *Neue Anekdota* — collection of articles by Moses Hess, Karl Grün, Otto Lüning and other representatives of "true socialism" published in Darmstadt at the end of May 1845
6. ↑ *Cabinet Montpensier* — a reading room in the Palais-Royal, formerly a palace of the Princes of Orleans in Paris
7. ↑ Probably an allusion to the organisers of the first political parties of American workers and artisans founded at the end of the 1820s — the Republican Political Association of the Working Men of the City of

Philadelphia, the New York Working Men's Party (their leaders were Frances Wright, Robert Dale Owen, Thomas Skidmore) and other labour associations in various American towns. These organisations had a democratic programme, advocated land reform and other social measures and supported the demand for a ten-hour working day. Although they were short-lived (they existed only until 1834), had a local characters and were composed of factions holding rather heterogeneous views, these first workers' parties gave an impetus to the incipient labour movement in the United States and helped to disseminate utopian socialist ideas, for many of their members were supporters of this trend

8. ↑ The *States-General* — the supreme executive and legislative organ of the Netherlands or the Republic of the United Provinces, as the country was called from 1579 to 1795. 'this assembly consisted of representatives of the seven provinces. The trading bourgeoisie played a dominant part in it
9. ↑ *Lettres d'un Habitant de Cenève à ses Contemporains* was written by Saint-Simon in 1802 and published anonymously in Paris in 1803
10. ↑ *The Newton Council* — a plan to set up such a council was put forward by Saint-Simon in his book *Lettres d'un Habitant de Cenève à ses Contemporains*. Its purpose was to create conditions that would enable scientists and artists to develop their talents freely. Funds were to be raised by public subscription. Each subscriber was to nominate three mathematicians, three physicists, three chemists, three physiologists, three writers, three painters and three musicians. The sum collected by subscription was to be divided among the three mathematicians, physicists, etc., who had received the greatest number of votes and had thus become members of the Newton Council
11. ↑ The reference is to the following sentences: "The aim of all social institutions must be to improve the moral, intellectual and physical condition of the most numerous and poorest class. "All inherited privileges, without exception, are abolished. "To each according to his capacity, to each capacity according to its works
12. ↑ The first schism of the Saint-Simonian school occurred in November 183 1, caused by Enfantin's and Bazard's increasingly discordant views on religion, marriage and the family
13. ↑ *Ménilmontant* — then a suburb of Paris where Enfantin, who after Bazard's death became the acknowledged leader of the Saint-Simonian school, the "father superior" of the Saint-Simonists, tried to establish a labour commune in 1832. Enfantin's work *Économie politique et Politique* was printed in book form in Paris in 183 1, after having been published earlier as a series of articles in the newspaper *Le Globe*.
14. ↑ *Le Livre nouveau* (The New Book) — a manuscript containing an exposition of the Saint-Simonian doctrine. It was drawn up by the leaders of

the Saint-Simonian school, which was headed by Enfantin, in the course of a series of meetings held in July 1832. Among the leaders present were Barrot, Fournel, Chevalier, Duverier and Lambert. The authors intended the book to become the "new Bible" of the Saint-Simonian doctrine. Extracts from the *Livre nouveau* and other information about it can be found in Reybaud's book *Études sur les réformateurs ou socialistes modernes.*

15. ↑ *Fourier's series* — a method of classification which Fourier used to analyse various natural and social phenomena. With the help of this method he tried, in particular, to work out a new social science based on the doctrine of attraction and repulsion of passions. which he regarded as the principal factor of social development (passions, in their turn, were classified by Fourier into groups or series). In this method Fourier combines unscientific and fantastic elements with rational observations
16. ↑ Organisers of labour — an allusion to the utopian socialists (in particular Fourier and his followers) who put forward a plan for the peaceful transformation of society by means of associations, that is, by "organisation of labour", which they opposed to the anarchy of production under capitalism.
    Some of these ideas were used by the French petty-bourgeois socialist Louis Blanc in his book Organisation du travail (Paris, 1839) in which he proposed that the bourgeois state should transform contemporary society into a socialist society.
17. ↑ *Patristic philosophy* — the teachings of the Fathers of the Church (3rd to 5th century)
18. ↑ The spontaneous popular risings which took place in many parts of France, and also in Paris, in 1775 were caused by crop failure and famine. The feudal aristocracy which was against Turgot's reforms used these uprisings to oust him from the post of Controller-General of Finance. In the spring of 1776, Turgot was dismissed and the reforms he had introduced (free trade in grain, abolition of some feudal privileges and of the guilds) were rescinded.
19. ↑ Unlike the other extant chapters of Volume II, which are in Engels' handwriting, the manuscript of Chapter V is in Joseph Weydemeyer's hand and "M. Hess" is written at the end. In December 1845, the journal *Gesellschaftsspiegel* No. 6 carried an article by Hess under the heading "Umtriebe der Kommunistischen Propheten" which discussed the same subject in a similar way as this chapter. It is probable that Chapter V was written by Hess, copied by Weydemeyer and edited by Marx and Engels. *Die Neue Welt oder das Reich des Geistes auf Erden*, the book examined in this chapter, was published anonymously in 1845. It consists of lectures by Georg Kuhlmann delivered in the Swiss communities of the League of the

Just. These communities were founded by Wilhelm Weitling. The League of the Just was a secret organisation of German workers and artisans, which had branches in Germany, France, Switzerland and England. The ideas of "true socialism" were at that time widespread among the members of the League, many of whom were artisans living abroad. A criticism of Kuhlmann's activities and his book can be found in the article "Zur Geschichte des Urchristentums" written

Note on the Text

Marx wrote this huge manuscript as part of his preparation for what would become *A Contribution to the Critique of Political Economy* (published in 1859) and *Capital* (published 1867).

Soviet Marxologists released several never-before-seen Marx/Engels works in the 1930s. Most were early works – like the *Economic and Philosophical Manuscripts* – but the *Grundrisse* stood alone as issuing forth from the most intense period of Marx’s decade-long, in-depth study of economics. It is an extremely rich and thought-provoking work, showing signs of humanism and the influence of Hegelian dialectic method. Do note, though, Marx did not intend it for publication as is, so it can be stylistically very rough in places.

The series of seven notebooks were rough-drafted by Marx, chiefly for purposes of self-clarification, during the winter of 1857-8. The manuscript became lost in circumstances still unknown and was first effectively published, in the German original, in 1953. A limited edition was published by Foreign Language Publishers in Moscow in two volumes, 1939 and 1941 respectively, under the editorship of the Marx-Engels-Lenin Institute, Moscow. The first volume contained the introduction and the seven notebooks translated here. The second added fragments from Marx’s 1851 notebooks of excerpts from Ricardo, the fragment ‘Bastiat and Carey’ (also included in this translation), and miscellaneous related material; also extensive annotations and sources. A photo-offset reprint of the two volumes bound in one, minus illustrations and facsimiles, was issued by Dietz Verlag, Berlin (E.), in 1953, and is the basis of the present translation. It is referred to hereafter as *Grundrisse*. Rosdolsky states that only three or four copies of the 1939-41 edition ever reached ‘the western world’.

(2) General relation between production, distribution, exchange and consumption
(3) The method of political economy
(4) Means (forces) of production and relations of production, relations of production and relations of circulation
THE CHAPTER ON MONEY (Notebooks I and II, pp. 1–7)
Darimon's theory of crises
Gold export and crises
Convertibility and note circulation
Value and price
Transformation of the commodity into exchange value; money
Contradictions in the money relation
(1) Contradiction between commodity as product and commodity as exchange value
(2) Contradiction between purchase and sale
(3) Contradiction between exchange for the sake of exchange and exchange for the sake of commodities
(Aphorisms)
(4) Contradiction between money as particular commodity and money as general commodity
(The *Economist* and the *Morning Star* on money)
Attempts to overcome the contradictions by the issue of time-chits
Exchange value as mediation of private interests
Exchange value (money) as social bond
Social relations which create an undeveloped system of exchange
The product becomes a commodity; the commodity becomes exchange value; the exchange value of the commodity becomes money
Money as measure
Money as objectification of general labour time
(Incidental remark on gold and silver)
Distinction between particular labour time and general labour time
Distinction between planned distribution of labour time and measurement of exchange values by labour time
(Strabo on money among the Albanians)

The precious metals as subjects of the money relation
(a) Gold and silver in relation to the other metals
(b) Fluctuations in the value-relations between the different metals
(c) and (d) (headings only): Sources of gold and silver; money as coin
Circulation of money and opposite circulation of commodities
General concept of circulation
(a) Circulation circulates exchange values in the form of prices
(Distinction between real money and accounting money)
(b) Money as the medium of exchange
(What determines the quantity of money required for circulation)
(Comment on (a))
Commodity circulation requires appropriation through alienation
Circulation as an endlessly repeated process
The price as external to and independent of the commodity
Creation of general medium of exchange
Exchange as a special business
Double motion of circulation: C–M; M–C, and M–C; C–M
Three contradictory functions of money
(1) Money as general material of contracts, as measuring unit of exchange values
(2) Money as medium of exchange and realizer of prices
(Money, as representative of price, allows commodities to be exchanged at equivalent prices)
(An example of confusion between the contradictory functions of money)
(Money as particular commodity and money as general commodity)
(3) Money as money: as material representative of wealth (accumulation of money)
(Dissolution of ancient communities through money)
(Money, unlike coin, has a universal character)
(Money in its third function is the negation (negative unity) of its character as medium of circulation and measure)
(Money in its metallic being; accumulation of gold and silver)
(Headings on money, to be elaborated later)
THE CHAPTER ON CAPITAL (Notebooks II pp. 8–28, III-VII)
The Chapter on Money as Capital
Difficulty in grasping money in its fully developed character as money
Simple exchange: relations between the exchangers
(Critique of socialists and harmonizers: Bastiat, Proudhon)

SECTION ONE: THE PRODUCTION PROCESS OF CAPITAL

Nothing is expressed when capital is characterized merely as a sum of values
Landed property and capital
Capital comes from circulation; its content is exchange value; merchant capital, money capital, and money interest
Circulation presupposes another process; motion between presupposed extremes
Transition from circulation to capitalist production
Capital is accumulated labour (etc.)
‘Capital is a sum of values used for the production of values’
Circulation, and exchange value deriving from circulation, the presupposition of capital
Exchange value emerging from circulation, a presupposition of circulation, preserving and multiplying itself in it by means of labour
Product and capital. Value and capital. Proudhon
Capital and labour. Exchange value and use value for exchange value
Money and its use value (labour) in this relation capital. Self-multiplication of value is its only movement
Capital, as regards substance, objectified labour. Its antithesis living, productive labour
Productive labour and labour as performance of a service
Productive and unproductive labour. A. Smith etc.
The two different processes in the exchange of capital with labour
Capital and modern landed property
The market
Exchange between capital and labour. Piecework wages
Value of labour power
Share of the wage labourer in general wealth determined only quantitatively
Money is the worker’s equivalent; he thus confronts capital as an equal
But the aim of his exchange is satisfaction of his need. Money for him is only medium of circulation
Savings, self-denial as means of the worker’s enrichment
Valuelessness and devaluation of the worker a condition of capital
(Labour power as capital!)
Wages not productive
The exchange between capital and labour belongs within simple circulation, does not enrich the worker
Separation of labour and property the precondition of this exchange

Labour as object absolute poverty, labour as subject general possibility of wealth
Labour without particular specificity confronts capital
Labour process absorbed into capital
(Capital and capitalist)
Production process as content of capital
The worker relates to his labour as exchange value, the capitalist as use value
The worker divests himself of labour as the wealth-producing power; capital appropriates it as such
Transformation of labour into capital
Realization process
(Costs of production)
Mere self-preservation, non-multiplication of value contradicts the essence of capital
Capital enters the cost of production as capital. Interest-bearing capital
(Parentheses on: original accumulation of capital, historic presuppositions of capital, production in general)
Surplus value. Surplus labour time
Value of labour. How it is determined
Conditions for the self-realization of capital
Capital is productive as creator of surplus labour
But this is only a historical and transitory phenomenon
Theories of surplus value (Ricardo; the Physiocrats; Adam Smith; Ricardo again)
Surplus value and productive force. Relation when these increase
Result: in proportion as necessary labour is already diminished, the realization of capital becomes more difficult
Concerning increases in the value of capital
Labour does not reproduce the value of material and instrument, but rather preserves it by relating to them in the labour process as to their objective conditions
Absolute surplus labour time. Relative
It is not the quantity of living labour, but rather its quality as labour which preserves the labour time already contained in the material
The change of form and substance in the direct production process
It is inherent in the simple production process that the previous stage of production is preserved through the subsequent one
Preservation of the old use value by new labour

The quantity of objectified labour is preserved because contact with living labour preserves its quality as use value for new labour

In the real production process, the separation of labour from its objective moments of existence is suspended. But in this process labour is already incorporated in capital

The capitalist obtains surplus labour free of charge together with the maintenance of the value of material and instrument

Through the appropriation of present labour, capital already possesses a claim to the appropriation of future labour

Confusion of profit and surplus value. Carey’s erroneous calculation

The capitalist, who does not pay the worker for the preservation of the old value, then demands remuneration for giving the worker permission to preserve the old capital

Surplus Value and Profit

Difference between consumption of the instrument and of wages. The former consumed in the production process, the latter outside it

Increase of surplus value and decrease in rate of profit

Multiplication of simultaneous working days

Machinery

Growth of the constant part of capital in relation to the variable part spent on wages = growth of the productivity of labour

Proportion in which capital has to increase in order to employ the same number of workers if productivity rises

Percentage of total capital can express very different relations

Capital (like property in general) rests on the productivity of labour

Increase of surplus labour time. Increase of simultaneous working days. (Population)

(Population can increase in proportion as necessary labour time becomes smaller)

Transition from the process of the production of capital into the process of circulation

SECTION TWO: THE CIRCULATION PROCESS OF CAPITAL

Devaluation of capital itself owing to increase of productive forces

(Competition)

Capital as unity and contradiction of the production process and the realization process

Capital as limit to production. Overproduction

Demand by the workers themselves

Barriers to capitalist production

Overproduction; Proudhon
Price of the commodity and labour time
The capitalist does not sell too dear; but still above what the thing costs him
Price can fall below value without damage to capital
Number and unit (measure) important in the multiplication of prices
Specific accumulation of capital. (Transformation of surplus labour into capital)
The determination of value and of prices
The general rate of profit
The capitalist merely sells at his own cost of production, then it is a transfer to another capitalist. The worker gains almost nothing thereby
Barrier of capitalist production. Relation of surplus labour to necessary labour. Proportion of the surplus consumed by capital to that transformed into capital
Devaluation during crises
Capital coming out of the production process becomes money again
(Parenthesis on capital in general)
Surplus Labour or Surplus Value Becomes Surplus Capital
All the determinants of capitalist production now appear as the result of (wage) labour itself
The realization process of labour at the same time its de-realization process
Formation of surplus capital I
Surplus capital II
Inversion of the law of appropriation
Chief result of the production and realization process
Original Accumulation of Capital
Once developed historically, capital itself creates the conditions of its existence
(Performance of personal services, as opposed to wage labour)
(Parenthesis on inversion of the law of property, real alien relation of the worker to his product, division of labour, machinery)
Forms which precede capitalist production. (Concerning the process which precedes the formation of the capital relation or of original accumulation)
Exchange of labour for labour rests on the worker’s propertylessness
Circulation of capital and circulation of money
Production process and circulation process moments of production. The productivity of the different capitals (branches of industry) determines that of the individual capital
Circulation period. Velocity of circulation substitutes for volume of capital. Mutual dependence of capitals in the velocity of their circulation

The four moments in the turnover of capital
Moment II to be considered here: transformation of the product into money; duration of this operation
Transport costs
Circulation costs
Means of communication and transport
Division of the branches of labour
Concentration of many workers; productive force of this concentration
General as distinct from particular conditions of production
Transport to market (spatial condition of circulation) belongs in the production process
Credit, the temporal moment of circulation
Capital is circulating capital
Influence of circulation on the determination of value; circulation time = time of devaluation
Difference between the capitalist mode of production and all earlier ones (universality, propagandistic nature)
(Capital itself is the contradiction)
Circulation and creation of value
Capital not a source of value-creation
Continuity of production presupposes suspension of circulation time
Theories of Surplus Value
Ramsay’s view that capital is its own source of profit
No surplus value according to Ricardo’s law
Ricardo’s theory of value. Wages and profit
Quincey
Ricardo
Wakefield. Conditions of capitalist production in colonies
Surplus value and profit. Example (Malthus)
Difference between labour and labour capacity
Carey’s theory of the cheapening of capital for the worker
Carey’s theory of the decline of the rate of profit
Wakefield on the contradiction between Ricardo’s theories of wage labour and of value
Bailey on dormant capital and increase of production without previous increase of capital
Wade’s explanation of capital. Capital, collective force. Capital, civilization
Rossi. What is capital? Is raw material capital? Are wages necessary for it?

Malthus. Theory of value and of wages
Aim of capitalist production value (money), not commodity, use value etc. Chalmers
Difference in return. Interruption of the production process. Total duration of the production process. Unequal periods of production
The concept of the free labourer contains the pauper. Population and overpopulation
Necessary labour. Surplus labour. Surplus population. Surplus capital
Adam Smith: work as sacrifice
Adam Smith: the origin of profit
Surplus labour. Profit. Wages
Immovable capital. Return of capital. Fixed capital. John Stuart Mill
Turnover of capital. Circulation process. Production process
Circulation costs. Circulation time
Capital’s change of form and of substance; different forms of capital; circulating capital as general character of capital
Fixed (tied down) capital and circulating capital
Constant and variable capital
Competition
Surplus value. Production time. Circulation time. Turnover time
Competition (continued)
Part of capital in production time, part in circulation time
Surplus value and production phase. Number of reproductions of capital = number of turnovers
Change of form and of matter in the circulation of capital C–M–C. M–C–M
Difference between production time and labour time
Formation of a mercantile estate; credit
Small-scale circulation. The process of exchange between capital and labour capacity generally
Threefold character, or mode, of circulation
Fixed capital and circulating capital
Influence of fixed capital on the total turnover time of capital
Fixed capital. Means of labour. Machine
Transposition of powers of labour into powers of capital both in fixed and in circulating capital
To what extent fixed capital (machine) creates value
Fixed capital & continuity of the production process. Machinery & living labour

Contradiction between the foundation of bourgeois production (value as measure) and its development
Significance of the development of fixed capital (for the development of capital generally)
The chief role of capital is to create disposable time; contradictory form of this in capital
Durability of fixed capital
Real saving (economy) = saving of labour time = development of productive force
True conception of the process of social production
Owen’s historical conception of industrial (capitalist) production
Capital and value of natural agencies
Scope of fixed capital indicates the level of capitalist production
Is money fixed capital or circulating capital?
Turnover time of capital consisting of fixed capital and circulating capital. Reproduction time of fixed capital
The same commodity sometimes circulating capital, sometimes fixed capital
Every moment which is a presupposition of production is at the same time its result, in that it reproduces its own conditions
The counter-value of circulating capital must be produced within the year. Not so for fixed capital. It engages the production of subsequent years
Maintenance costs of fixed capital
Revenue of fixed capital and circulating capital
Free labour = latent pauperism. Eden
The smaller the value of fixed capital in relation to its product, the more useful
Movable and immovable, fixed and circulating
Connection of circulation and reproduction

SECTION THREE: CAPITAL AS FRUCTIFEROUS. TRANSFORMATION OF SURPLUS VALUE INTO PROFIT

Rate of profit. Fall of the rate of profit
Surplus value as profit always expresses a lesser proportion
Wakefield, Carey and Bastiat on the rate of profit
Capital and revenue (profit). Production and distribution. Sismondi
Transformation of surplus value into profit
Laws of this transformation
Surplus value = relation of surplus labour to necessary labour
Value of fixed capital and its productive power
Machinery and surplus labour. Recapitulation of the doctrine of surplus value

generally
Relation between the objective conditions of production. Change in the proportion of the component parts of capital

MISCELLANEOUS

Money and fixed capital: presupposes a certain amount of wealth. Relation of fixed capital and circulating capital. (*Economist*)
Slavery and wage labour; profit upon alienation (Steuart)
Steuart, Montanari and Gouge on money
The wool industry in England since Elizabeth; silk-manufacture; iron; cotton
Origin of free wage labour. Vagabondage. (Tuckett)
Blake on accumulation and rate of profit; dormant capital
Domestic agriculture at the beginning of the sixteenth century. (Tuckett)
Profit. Interest. Influence of machinery on the wage fund. (*Westminster Review*)
Money as measure of values and yardstick of prices. Critique of theories of the standard measure of money
Transformation of the medium of circulation into money. Formation of treasures. Means of payment. Prices of commodities and quantity of circulating money. Value of money
Capital, not labour, determines the value of money. (Torrens)
The minimum of wages
Cotton machinery and working men in 1826. (Hodgskin)
How the machine creates raw material. (*Economist*)
Machinery and surplus labour
Capital and profit. Relation of the worker to the conditions of labour in capitalist production. All parts of capital bring a profit
Tendency of the machine to prolong labour
Cotton factories in England. Example for machinery and surplus labour
Examples from Glasgow for the rate of profit
Alienation of the conditions of labour with the development of capital. Inversion
Merivale. Natural dependence of the worker in colonies to be replaced by artificial restrictions
How the machine saves material. Bread. D'eau de la Malle
Development of money and interest
Productive consumption. Newman. Transformations of capital. Economic cycle
Dr Price. Innate power of capital
Proudhon. Capital and simple exchange. Surplus

Necessity of the worker's propertylessness
Galiani
Theory of savings. Storch
MacCulloch. Surplus. Profit
Arnd. Natural interest
Interest and profit. Carey
How merchant takes the place of master
Merchant wealth
Commerce with equivalents impossible. Opdyke
Principal and interest
Double standard
On money
James Mill's false theory of prices
Ricardo on currency
On money
Theory of foreign trade. Two nations may exchange according to the law of profit in such a way that both gain, but one is always defrauded
Money in its third role, as money

BASTIAT AND CAREY
Bastiat's economic harmonies
Bastiat on wages

Introduction

Late August – Mid-September 1857

1. Production, Consumption, Distribution, Exchange (Circulation)

(1) PRODUCTION

Independent Individuals. Eighteenth-century Ideas

The object before us, to begin with, *material production*.

Individuals producing in society – hence socially determined individual production – is, of course, the point of departure. The individual and isolated hunter and fisherman, with whom Smith and Ricardo begin, belongs among the unimaginative conceits of the eighteenth-century Robinsonades, [1] which in no way express merely a reaction against over-sophistication and a return to a misunderstood natural life, as cultural historians imagine. As little as Rousseau's *contrat social*, which brings naturally independent, autonomous subjects into relation and connection by contract, rests on such naturalism. This is the semblance, the merely aesthetic semblance, of the Robinsonades, great and small. It is, rather, the anticipation of 'civil society', in preparation since the sixteenth century and making giant strides towards maturity in the eighteenth. In this society of free competition, the individual appears detached from the natural bonds etc. which in earlier historical periods make him the accessory of a definite and limited human conglomerate. Smith and Ricardo still stand with both feet on the shoulders of the eighteenth-century prophets, in whose imaginations this eighteenth-century individual – the product on one side of the dissolution of the feudal forms of society, on the other side of the new forces of production developed since the sixteenth century – appears as an ideal, whose existence they project into the past. Not as a historic result but as history's point of departure. As the Natural Individual appropriate to their notion of human nature, not arising historically, but posited by nature. This illusion has been common to each new epoch to this day. Steuart [2] avoided this simple-mindedness because as an aristocrat and in antithesis to the eighteenth century, he had in some respects a more historical footing.

The more deeply we go back into history, the more does the individual, and hence also the producing individual, appear as dependent, as belonging to a greater whole: in a still quite natural way in the family and in the family expanded into the clan [*Stamm*]; then later in the various forms of communal society arising out of the antitheses and fusions of the clan. Only in the eighteenth century, in ‘civil society’, do the various forms of social connectedness confront the individual as a mere means towards his private purposes, as external necessity. But the epoch which produces this standpoint, that of the isolated individual, is also precisely that of the hitherto most developed social (from this standpoint, general) relations. The human being is in the most literal sense a ζῶον πολιτιχόν, [3] not merely a gregarious animal, but an animal which can individuate itself only in the midst of society. Production by an isolated individual outside society – a rare exception which may well occur when a civilized person in whom the social forces are already dynamically present is cast by accident into the wilderness – is as much of an absurdity as is the development of language without individuals living *together* and talking to each other. There is no point in dwelling on this any longer. The point could go entirely unmentioned if this twaddle, which had sense and reason for the eighteenth-century characters, had not been earnestly pulled back into the centre of the most modern economics by Bastiat, [4] Carey, [5] Proudhon etc. Of course it is a convenience for Proudhon et al. to be able to give a historico-philosophic account of the source of an economic relation, of whose historic origins he is ignorant, by inventing the myth that Adam or Prometheus stumbled on the idea ready-made, and then it was adopted, etc. Nothing is more dry and boring than the fantasies of a *locus communis*. [6]

Eternalization of historic relations of production. – Production and distribution in general. – Property

Whenever we speak of production, then, what is meant is always production at a definite stage of social development – production by social individuals. It might seem, therefore, that in order to talk about production at all we must either pursue the process of historic development through its different phases, or declare beforehand that we are dealing with a specific historic epoch such as e.g. modern bourgeois production, which is indeed our particular theme. However, all epochs of production have certain common traits, common characteristics. *Production in general* is an abstraction, but a rational abstraction in so far as it really brings out and fixes the common element and thus saves us repetition. Still, this *general* category, this common element sifted out by comparison, is itself segmented many times over and splits into different determinations. Some determinations belong to all epochs, others only to a few. [Some] determinations will be shared by the most modern epoch and the most ancient. No production will be thinkable without them; however even though the most developed languages have laws and characteristics in common with the least developed, nevertheless, just those things which determine their development, i.e. the elements which are not general and common, must be separated out from the determinations valid for production as such, so that in their unity – which arises already from the identity of the subject, humanity, and of the object, nature – their essential difference is not forgotten. The whole profundity of those modern economists who demonstrate the eternity and harmoniousness of the existing social relations lies in this forgetting. For example. No production possible without an instrument of production, even if this instrument is only the hand. No production without stored-up, past labour, even if it is only the facility gathered together and concentrated in the hand of the savage by repeated practice. Capital is, among other things, also an instrument of production, also objectified, past labour. Therefore capital is a general, eternal relation of nature; that is, if I leave out just the specific quality which alone makes ‘instrument of production’ and ‘stored-up labour’ into capital. The entire history of production relations thus appears to Carey, for example, as a malicious forgery perpetrated by governments.

If there is no production in general, then there is also no general production. Production is always a *particular* branch of production – e.g. agriculture, cattle-raising, manufactures etc. – or it is a *totality*. But political economy is not technology. The relation of the general characteristics of production at a given stage of social development to the particular forms of production to be developed elsewhere (later). Lastly, production also is not only a particular production. Rather, it is always a certain social body, a social subject, which is active in a greater or sparser totality of branches of production. Nor does the relationship between scientific presentation and the real movement belong here yet. Production in general. Particular branches of production. Totality of production.

It is the fashion to preface a work of economics with a general part – and precisely this part figures under the title ‘production’ (see for example J. St. Mill) [7] – treating of the *general preconditions* of all production. This general part consists or is alleged to consist of (1) the conditions without which production is not possible. I.e. in fact, to indicate nothing more than the essential moments of all production. But, as we will see, this reduces itself in fact to a few very simple characteristics, which are hammered out into flat tautologies; (2) the conditions which promote production to a greater or lesser degree, such as e.g. Adam Smith’s progressive and stagnant state of society. While this is of value in his work as an insight, to elevate it to scientific significance would require investigations into the periodization of *degrees of productivity* in the development of individual peoples – an investigation which lies outside the proper boundaries of the theme, but, in so far as it does belong there, must be brought in as part of the development of competition, accumulation etc. In the usual formulation, the answer amounts to the general statement that an industrial people reaches the peak of its production at the moment when it arrives at its historical peak generally. In fact. The industrial peak of a people when its main concern is not yet gain, but rather to gain. Thus the Yankees over the English. Or, also, that e.g. certain races, locations, climates, natural conditions such as harbours, soil fertility etc. are more advantageous to production than others. This too amounts to the tautology that wealth is more easily created where its elements are subjectively and objectively present to a greater degree.

But none of all this is the economists’ real concern in this general part. The aim is, rather, to present production – see e.g. Mill – as distinct from distribution etc., as encased in eternal natural laws independent of history, at which opportunity *bourgeois* relations are then quietly smuggled in as the inviolable natural laws on which society in the abstract is founded. This is the more or less conscious purpose of the whole proceeding. In distribution, by contrast, humanity has allegedly permitted itself to be considerably more arbitrary. Quite apart from this crude tearing-apart of production and distribution and of their real relationship, it must be apparent from the outset that, no matter how differently distribution may have been arranged in different stages of social development, it must be possible here also, just as with production, to single out common characteristics, and just as possible to confound or to extinguish all historic differences under *general human* laws. For example, the slave, the serf and the wage labourer all receive a quantity of food which makes it possible for them to exist as slaves, as serfs, as wage labourers. The conqueror who lives from tribute, or the official who lives from taxes, or the landed proprietor and his rent, or the monk and his alms, or the Levite and his tithe, all receive a quota of social production, which is determined by other laws than that of the slave's, etc. The two main points which all economists cite under this rubric are: (1) property; (2) its protection by courts, police, etc. To this a very short answer may be given:

to 1. All production is appropriation of nature on the part of an individual within and through a specific form of society. In this sense it is a tautology to say that property (appropriation) is a precondition of production. But it is altogether ridiculous to leap from that to a specific form of property, e.g. private property. (Which further and equally presupposes an antithetical form, *non-property*.) History rather shows common property (e.g. in India, among the Slavs, the early Celts, etc.) to be the more [8] original form, a form which long continues to play a significant role in the shape of communal property. The question whether wealth develops better in this or another form of property is still quite beside the point here. But that there can be no production and hence no society where some form of property does not exist is a tautology. An appropriation which does not make something into property is a *contradictio in subjecto*.

to 2. Protection of acquisitions etc. When these trivialities are reduced to their real content, they tell more than their preachers know. Namely that every form of production creates its own legal relations, form of government, etc. In bringing things which are organically related into an accidental relation, into a merely reflective connection, they display their crudity and lack of conceptual understanding. All the bourgeois economists are aware of is that production can be carried on better under the modern police than e.g. on the principle of might makes right. They forget only that this principle is also a legal relation, and that the right of the stronger prevails in their ‘constitutional republics’ as well, only in another form.

When the social conditions corresponding to a specific stage of production are only just arising, or when they are already dying out, there are, naturally, disturbances in production, although to different degrees and with different effects.

To summarize: There are characteristics which all stages of production have in common, and which are established as general ones by the mind; but the so-called *general preconditions* of all production are nothing more than these abstract moments with which no real historical stage of production can be grasped.

(2) THE GENERAL RELATION OF PRODUCTION TO DISTRIBUTION, EXCHANGE, CONSUMPTION

Before going further in the analysis of production, it is necessary to focus on the various categories which the economists line up next to it.

The obvious, trite notion: in production the members of society appropriate (create, shape) the products of nature in accord with human needs; distribution determines the proportion in which the individual shares in the product; exchange delivers the particular products into which the individual desires to convert the portion which distribution has assigned to him; and finally, in consumption, the products become objects of gratification, of individual appropriation. Production creates the objects which correspond to the given needs; distribution divides them up according to social laws; exchange further parcels out the already divided shares in accord with individual needs; and finally, in consumption, the product steps outside this social movement and becomes a direct object and servant of individual need, and satisfies it in being consumed. Thus production appears as the point of departure, consumption as the conclusion, distribution and exchange as the middle, which is however itself twofold, since distribution is determined by society and exchange by individuals. The person objectifies himself in production, the thing subjectifies itself in the person; [9] in distribution, society mediates between production and consumption in the form of general, dominant determinants; in exchange the two are mediated by the chance characteristics of the individual.

Distribution determines the relation in which products fall to individuals (the amount); exchange determines the production [10] in which the individual demands the portion allotted to him by distribution.

Thus production, distribution, exchange and consumption form a regular syllogism; production is the generality, distribution and exchange the particularity, and consumption the singularity in which the whole is joined together. This is admittedly a coherence, but a shallow one. Production is determined by general natural laws, distribution by social accident, and the latter may therefore promote production to a greater or lesser extent; exchange stands between the two as formal social movement; and the concluding act, consumption, which is conceived not only as a terminal point but also as an end-in-itself, actually belongs outside economics except in so far as it reacts in turn upon the point of departure and initiates the whole process anew.

The opponents of the political economists – whether inside or outside its realm – who accuse them of barbarically tearing apart things which belong together, stand either on the same ground as they, or beneath them. Nothing is more common than the reproach that the political economists view production too much as an end in itself, that distribution is just as important. This accusation is based precisely on the economic notion that the spheres of distribution and of production are independent, autonomous neighbours. Or that these moments were not grasped in their unity. As if this rupture had made its way not from reality into the textbooks, but rather from the textbooks into reality, and as if the task were the dialectic balancing of concepts, and not the grasping of real relations!

[*Consumption and Production*]

(a_1) Production is also immediately consumption. Twofold consumption, subjective and objective: the individual not only develops his abilities in production, but also expends them, uses them up in the act of production, just as natural procreation is a consumption of life forces. Secondly: consumption of the means of production, which become worn out through use, and are partly (e.g. in combustion) dissolved into their elements again. Likewise, consumption of the raw material, which loses its natural form and composition by being used up. The act of production is therefore in all its moments also an act of consumption. But the economists admit this. Production as directly identical with consumption, and consumption as directly coincident with production, is termed by them *productive consumption.* This identity of production and consumption amounts to Spinoza's thesis: *determinatio est negatio.* [11]

But this definition of productive consumption is advanced only for the purpose of separating consumption as identical with production from consumption proper, which is conceived rather as the destructive antithesis to production. Let us therefore examine consumption proper.

Consumption is also immediately production, just as in nature the consumption of the elements and chemical substances is the production of the plant. It is clear that in taking in food, for example, which is a form of consumption, the human being produces his own body. But this is also true of every kind of consumption which in one way or another produces human beings in some particular aspect. Consumptive production. But, says economics, this production which is identical with consumption is secondary, it is derived from the destruction of the prior product. In the former, the producer objectified himself, in the latter, the object he created personifies itself. Hence this consumptive production – even though it is an immediate unity of production and consumption – is essentially different from production proper. The immediate unity in which production coincides with consumption and consumption with production leaves their immediate duality intact.

Production, then, is also immediately consumption, consumption is also immediately production. Each is immediately its opposite. But at the same time a mediating movement takes place between the two. Production mediates consumption; it creates the latter's material; without it, consumption would lack an object. But consumption also mediates production, in that it alone creates for the products the subject for whom they are products. The product only obtains its last finish in consumption. A railway on which no trains run, hence which is not used up, not consumed, is a railway only δυνάμει, [13] and not in reality.

Without production, no consumption; but also, without consumption, no production; since production would then be purposeless. Consumption produces production in a double way, (1) because a product becomes a real product only by being consumed. For example, a garment becomes a real garment only in the act of being worn; a house where no one lives is in fact not a real house; thus the product, unlike a mere natural object, proves itself to be, *becomes,* a product only through consumption. Only by decomposing the product does consumption give the product the finishing touch; for the product is production not as [14] objectified activity, but rather only as object for the active subject; (2) because consumption creates the need for *new* production, that is it creates the ideal, internally impelling cause for production, which is its presupposition. Consumption creates the motive for production; it also creates the object which is active in production as its determinant aim. If it is clear that production offers consumption its external object, it is therefore equally clear that consumption *ideally posits* the object of production as an internal image, as a need, as drive and as purpose. It creates the objects of production in a still subjective form. No production without a need. But consumption reproduces the need.

Production, for its part, correspondingly (1) furnishes the material and the object for consumption. [15] Consumption without an object is not consumption; therefore, in this respect, production creates, produces consumption. (2) But the object is not the only thing which production creates for consumption. Production also gives consumption its specificity, its character, its finish. Just as consumption gave the product its finish as product, so does production give finish to consumption. *Firstly,* the object is not an object in general, but a specific object which must be consumed in a specific manner, to be mediated in its turn by production itself. Hunger is hunger, but the hunger gratified by cooked meat eaten with a knife and fork is a different hunger from that which bolts down raw meat with the aid of hand, nail and tooth. Production thus produces not only the object but also the manner of consumption, not only objectively but also subjectively. Production thus creates the consumer. (3) Production not only supplies a material for the need, but it also supplies a need for the material. As soon as consumption emerges from its initial state of natural crudity and immediacy – and, if it remained at that stage, this would be because production itself had been arrested there – it becomes itself mediated as a drive by the object. The need which consumption feels for the object is created by the perception of it. The object of art – like every other product – creates a public which is sensitive to art and enjoys beauty. Production thus not only creates an object for the subject, but also a subject for the object. Thus production produces consumption (1) by creating the material for it; (2) by determining the manner of consumption; and (3) by creating the products, initially posited by it as objects, in the form of a need felt by the consumer. It thus produces the object of consumption, the manner of consumption and the motive of consumption. Consumption likewise produces the producer's *inclination* by beckoning to him as an aim-determining need.

The identities between consumption and production thus appear threefold:

(1) *Immediate identity:* Production is consumption, consumption is production. Consumptive production. Productive consumption. The political economists call both productive consumption. But then make a further distinction. The first figures as reproduction, the second as productive consumption. All investigations into the first concern productive or unproductive labour; investigations into the second concern productive or non-productive consumption.

(2) [In the sense] that one appears as a means for the other, is mediated by the other: this is expressed as their mutual dependence; a movement which relates them to one another, makes them appear indispensable to one another, but still leaves them external to each other. Production creates the material, as external object, for consumption; consumption creates the need, as internal object, as aim, for production. Without production no consumption; without consumption no production. [This identity] figures in economics in many different forms.

(3) Not only is production immediately consumption and consumption immediately production, not only is production a means for consumption and consumption the aim of production, i.e. each supplies the other with its object (production supplying the external object of consumption, consumption the conceived object of production); but also, each of them, apart from being immediately the other, and apart from mediating the other, in addition to this creates the other in completing itself, and creates itself as the other. Consumption accomplishes the act of production only in completing the product

as product by dissolving it, by consuming its independently material form, by raising the inclination developed in the first act of production, through the need for repetition, to its finished form; it is thus not only the concluding act in which the product becomes product, but also that in which the producer becomes producer. On the other side, production produces consumption by creating the specific manner of consumption; and, further, by creating the stimulus of consumption, the ability to consume, as a need. This last identity, as determined under (3), [is] frequently cited in economics in the relation of demand and supply, of objects and needs, of socially created and natural needs.

Thereupon, nothing simpler for a Hegelian than to posit production and consumption as identical. And this has been done not only by socialist belletrists but by prosaic economists themselves, e.g. Say; [16] in the form that when one looks at an entire people, its production is its consumption. Or, indeed, at humanity in the abstract. Storch [17] demonstrated Say's error, namely that e.g. a people does not consume its entire product, but also creates means of production, etc., fixed capital, etc. To regard society as one single subject is, in addition, to look at it wrongly; speculatively. With a single subject, production and consumption appear as moments of a single act. The important thing to emphasize here is only that, whether production and consumption are viewed as the activity of one or of many individuals, they appear in any case as moments of one process, in which production is the real point of departure and hence also the predominant moment. Consumption as urgency, as need, is itself an intrinsic moment of productive activity. But the latter is the point of departure for realization and hence also its predominant moment; it is the act through which the whole process again runs its course. The individual produces an object and, by consuming it, returns to himself, but returns as a productive and self-reproducing individual. Consumption thus appears as a moment of production.

In society, however, the producer's relation to the product, once the latter is finished, is an external one, and its return to the subject depends on his relations to other individuals. He does not come into possession of it directly. Nor is its immediate appropriation his purpose when he produces in society. *Distribution* steps between the producers and the products, hence between production and consumption, to determine in accordance with social laws what the producer's share will be in the world of products.

Now, does distribution stand at the side of and outside production as an autonomous sphere?

Distribution and production

(b_1) When one examines the usual works of economics, it is immediately striking that everything in them is posited doubly. For example, ground rent, wages, interest and profit figure under distribution, while land, labour and capital figure under production as agents of production. In the case of capital, now, it is evident from the outset that it is posited doubly, (1) as agent of production, (2) as source of income, as a determinant of specific forms of distribution. Interest and profit thus also figure as such in production, in so far as they are forms in which capital increases, grows, hence moments of its own production. Interest and profit as forms of distribution presuppose capital as agent of production. They are modes of distribution whose presupposition is capital as agent of production. They are, likewise, modes of reproduction of capital.

The category of wages, similarly, is the same as that which is examined under a different heading as wage labour: the characteristic which labour here possesses as an agent of production appears as a characteristic of distribution. If labour were not specified as wage labour, then the manner in which it shares in the products would not appear as wages; as, for example, under slavery. Finally, to take at once the most developed form of distribution, ground rent, by means of which landed property shares in the product, presupposes large-scale landed property (actually, large-scale agriculture) as agent of production, and not merely land as such, just as wages do not merely presuppose labour as such. The relations and modes of distribution thus appear merely as the obverse of the agents of production. An individual who participates in production in the form of wage labour shares in the products, in the results of production, in the form of wages. The structure [*Gliederung*] of distribution is completely determined by the structure of production. Distribution is itself a product of production, not only in its object, in that only the results of production can be distributed, but also in its form, in that the specific kind of participation in production determines the specific forms of distribution, i.e. the pattern of participation in distribution. It is altogether an illusion to posit land in production, ground rent in distribution, etc.

Thus, economists such as Ricardo, who are the most frequently accused of focusing on production alone, have defined distribution as the exclusive object of economics, because they instinctively conceived the forms of distribution as the most specific expression into which the agents of production of a given society are cast.

To the single individual, of course, distribution appears as a social law which determines his position within the system of production within which he produces, and which therefore precedes production. The individual comes into the world possessing neither capital nor land. Social distribution assigns him at birth to wage labour. But this situation of being assigned is itself a consequence of the existence of capital and landed property as independent agents of production.

As regards whole societies, distribution seems to precede production and to determine it in yet another respect, almost as if it were a pre-economic fact. A conquering people divides the land among the conquerors, thus imposes a certain distribution and form of property in land, and thus determines production. Or it enslaves the conquered and so makes slave labour the foundation of production. Or a people rises in revolution and smashes the great landed estates into small parcels, and hence, by this new distribution, gives production a new character. Or a system of laws assigns property in land to certain families in perpetuity, or distributes labour [as] a hereditary privilege and thus confines it within certain castes. In all these cases, and they are all historical, it seems that distribution is not structured and determined by production, but rather the opposite, production by distribution.

In the shallowest conception, distribution appears as the distribution of products, and hence as further removed from and quasi-independent of production. But before distribution can be the distribution of products, it is: (1) the distribution of the instruments of production, and (2), which is a further specification of the same relation, the distribution of the members of the society among the different kinds of production. (Subsumption of the individuals under specific relations of production.) The distribution of products is evidently only a result of this distribution, which is comprised within the process of production itself and determines the structure of production. To examine production while disregarding this internal distribution within it is obviously an empty abstraction; while conversely, the distribution of products follows by itself from this distribution which forms an original moment of production. Ricardo, whose concern was to grasp the specific social structure of modern production, and who is the economist of production *par excellence,* declares for precisely that reason that *not* production but distribution is the proper study of modern economics. [18] This again shows the ineptitude of those economists who portray production as an eternal truth while banishing history to the realm of distribution.

The question of the relation between this production-determining distribution, and production, belongs evidently within production itself. If it is said that, since production must begin with a certain distribution of the instruments of production, it follows that distribution at least in this sense precedes and forms the presupposition of production, then the reply must be that production does indeed have its determinants and preconditions which form its moments. At the very beginning these may appear as spontaneous, natural. But by the process of production itself they are transformed from natural into historic determinants, and if they appear to one epoch as natural presuppositions of production, they were its historic product for another. Within production itself they are constantly being changed. The application of machinery, for example, changed the distribution of instruments of production as well as of products. Modern large-scale landed property is itself the product of modern commerce and of modern industry, as well as of the application of the latter to agriculture.

The questions raised above all reduce themselves in the last instance to the role played by general-historical relations in production, and their relation to the movement of history generally. The question evidently belongs within the treatment and investigation of production itself.

Still, in the trivial form in which they are raised above, they can be dealt with equally briefly. In all cases of conquest, three things are possible. The conquering people subjugates the conquered under its own mode of production (e.g. the English in Ireland in this century, and partly in India); or it leaves the old mode intact and contents itself with a tribute (e.g. Turks and Romans); or a reciprocal interaction takes place whereby something new, a synthesis, arises (the Germanic conquests, in part). In all cases, the mode of production, whether that of the conquering people, that of the conquered, or that emerging from the fusion of both, is decisive for the new distribution which arises. Although the latter appears as a presupposition of the new period of production, it is thus itself in turn a product of production, not only of historical production generally, but of the specific historic mode of production.

The Mongols, with their devastations in Russia, e.g., were acting in accordance with their production, cattle-raising, for which vast uninhabited spaces are a chief precondition. The Germanic barbarians, who lived in isolation on the land and for whom agriculture with bondsmen was the traditional production, could impose these conditions on the Roman provinces all the more easily as the concentration of landed property which had taken place there had already entirely overthrown the earlier agricultural relations.

It is a received opinion that in certain periods people lived from pillage alone. But, for pillage to be possible, there must be some thing to be pillaged, hence production. And the mode of pillage is itself in turn determined by the mode of production. A stock-jobbing nation, for example, cannot be pillaged in the same manner as a nation of cow-herds.

To steal a slave is to steal the instrument of production directly. But then the production of the country for which the slave is stolen must be structured to allow of slave labour, or (as in the southern part of America etc.) a mode of production corresponding to the slave must be created.

Laws may perpetuate an instrument of production, e.g. land, in certain families. These laws achieve economic significance only when large-scale landed property is in harmony with the society’s production, as e.g. in England. In France, small-scale agriculture survived despite the great landed estates, hence the latter were smashed by the revolution. But can laws perpetuate the small-scale allotment? Despite these laws, ownership is again becoming concentrated. The influence of laws in stabilizing relations of distribution, and hence their effect on production, requires to be determined in each specific instance.

(c$_1$) Exchange, Finally, and Circulation

Exchange and production

Circulation itself [is] merely a specific moment of exchange, or [it is] also exchange regarded in its totality.

In so far as *exchange* is merely a moment mediating between production with its production-determined distribution on one side and consumption on the other, but in so far as the latter itself appears as a moment of production, to that extent is exchange obviously also included as a moment within the latter.

It is clear, firstly, that the exchange of activities and abilities which takes place within production itself belongs directly to production and essentially constitutes it. The same holds, secondly, for the exchange of products, in so far as that exchange is the means of finishing the product and making it fit for direct consumption. To that extent, exchange is an act comprised within production itself. Thirdly, the so-called exchange between dealers and dealers is by its very organization entirely determined by production, as well as being itself a producing activity. Exchange appears as independent of and indifferent to production only in the final phase where the product is exchanged directly for consumption. But (1) there is no exchange without division of labour, whether the latter is spontaneous, natural, or already a product of historic development; (2) private exchange presupposes private production; (3) the intensity of exchange, as well as its extension and its manner, are determined by the development and structure of production. For example. Exchange between town and country; exchange in the country, in the town etc. Exchange in all its moments thus appears as either directly comprised in production or determined by it.

The conclusion we reach is not that production, distribution, exchange and consumption are identical, but that they all form the members of a totality, distinctions within a unity. Production predominates not only over itself, in the antithetical definition of production, but over the other moments as well. The process always returns to production to begin anew. That exchange and consumption cannot be predominant is self-evident. Likewise, distribution as distribution of products; while as distribution of the agents of production it is itself a moment of production. A definite production thus determines a definite consumption, distribution and exchange as well as *definite relations between these different moments*. Admittedly, however, *in its one-sided form,* production is itself determined by the other moments. For example if the market, i.e. the sphere of exchange, expands, then production grows in quantity and the divisions between its different branches become deeper. A change in distribution changes production, e.g. concentration of capital, different distribution of the population between town and country, etc. Finally, the needs of consumption determine production. Mutual interaction takes place between the different moments. This the case with every organic whole.

(3) THE METHOD OF POLITICAL ECONOMY

When we consider a given country politico-economically, we begin with its population, its distribution among classes, town, country, the coast, the different branches of production, export and import, annual production and consumption, commodity prices etc.

It seems to be correct to begin with the real and the concrete, with the real precondition, thus to begin, in economics, with e.g. the population, which is the foundation and the subject of the entire social act of production. However, on closer examination this proves false. The population is an abstraction if I leave out, for example, the classes of which it is composed. These classes in turn are an empty phrase if I am not familiar with the elements on which they rest. E.g. wage labour, capital, etc. These latter in turn presuppose exchange, division of labour, prices, etc. For example, capital is nothing without wage labour, without value, money, price etc. Thus, if I were to begin with the population, this would be a chaotic conception [*Vorstellung*] of the whole, and I would then, by means of further determination, move analytically towards ever more simple concepts [*Begriff*], from the imagined concrete towards ever thinner abstractions until I had arrived at the simplest determinations. From there the journey would have to be retraced until I had finally arrived at the population again, but this time not as the chaotic conception of a whole, but as a rich totality of many determinations and relations. The former is the path historically followed by economics at the time of its origins. The economists of the seventeenth century, e.g., always begin with the living whole, with population, nation, state, several states, etc.; but they always conclude by discovering through analysis a small number of determinant, abstract, general relations such as division of labour, money, value, etc. As soon as these individual moments had been more or less firmly established and abstracted, there began the economic systems, which ascended from the simple relations, such as labour, division of labour, need, exchange value, to the level of the state, exchange between nations and the world market. The latter is obviously the scientifically correct method. The concrete is concrete because it is the concentration of many determinations, hence unity of the diverse. It appears in the process of thinking, therefore, as a process of concentration, as a result, not as a point of departure, even though it is the point of departure in reality and hence also the point of departure for observation [*Anschauung*] and conception. Along the first path the full conception was evaporated to yield an abstract determination; along the second, the abstract determinations lead towards a reproduction of the concrete by way of thought. In this way Hegel fell into the illusion of conceiving the real as the product of thought concentrating itself, probing its own depths, and unfolding itself out of itself, by itself, whereas the method of rising from the abstract to the concrete is only the way in which thought appropriates the concrete, reproduces it as the concrete in the mind. But this is by no means the process by which the concrete itself comes into being. For example, the simplest economic category, say e.g. exchange value, presupposes population, moreover a population producing in specific relations; as well as a certain kind of family, or commune, or state, etc. It can never exist other than as an abstract, one-sided relation within an already given, concrete, living whole. As a category, by contrast, exchange value leads an antediluvian existence. Therefore, to the kind of consciousness – and this is characteristic of the philosophical consciousness – for which conceptual thinking is the real human being, and for which the conceptual world as such is thus the only reality, the movement of the categories appears as the real act of production – which only, unfortunately, receives a jolt from the outside – whose product is the world; and – but this is again a tautology – this is correct in so far as the concrete totality is a totality of thoughts, concrete in thought, in fact a product of thinking and comprehending; but not in any way a product of the concept which thinks and generates itself outside or above observation and conception; a product, rather, of the working-up of observation and conception into concepts. The totality as it appears in the head, as a totality of thoughts, is a product of a thinking head, which appropriates the world in the only way it can, a way different from the artistic, religious, practical and mental appropriation of this world. The real subject retains its autonomous existence outside the head just as before; namely as long as the head's conduct is merely speculative, merely theoretical. Hence, in the theoretical method, too, the subject, society, must always be kept in mind as the presupposition.

But do not these simpler categories also have an independent historical or natural existence pre-dating the more concrete ones? That depends. Hegel, for example, correctly begins the Philosophy of Right with possession, this being the subject's simplest juridical relation. But there is no possession preceding the family or master-servant relations, which are far more concrete relations. However, it would be correct to say that there are families or clan groups which still merely *possess,* but have no *property.* The simple category therefore appears in relation to property as a relation of simple families or clan groups. In the higher society it appears as the simpler relation of a developed organization. But the concrete substratum of which possession is a relation is always presupposed. One can imagine an individual savage as possessing something. But in that case possession is not a juridical relation. It is incorrect that possession develops historically into the family. Possession, rather, always presupposes this 'more concrete juridical category.' There would still always remain this much, however, namely that the simple categories are the expressions of relations within which the less developed concrete may have already realized itself before having posited the more many-sided connection or relation which is mentally expressed in the more concrete category; while the more developed concrete preserves the same category as a subordinate relation. Money may exist, and did exist historically, before capital existed, before banks existed, before wage labour existed, etc. Thus in this respect it may be said that the simpler category can express the dominant relations of a less developed whole, or else those subordinate relations of a more developed whole which already had a historic existence before this whole developed in the direction expressed by a more concrete category. To that extent the path of abstract thought, rising from the simple to the combined, would correspond to the real historical process.

It may be said on the other hand that there are very developed but nevertheless historically less mature forms of society, in which the highest forms of economy, e.g. cooperation, a developed division of labour, etc., are found, even though there is no kind of money, e.g. Peru. Among the Slav communities also, money and the exchange which determines it play little or no role within the individual communities, but only on their boundaries, in traffic with others; it is simply wrong to place exchange at the centre of communal society as the original, constituent element. It originally appears, rather, in the connection of the different communities with one another, not in the relations between the different members of a single community. Further, although money everywhere plays a role from very early on, it is nevertheless a predominant element, in antiquity, only within the confines of certain one-sidedly developed nations, trading nations. And even in the most advanced parts of the ancient world, among the Greeks and Romans, the full development of money, which is presupposed in modern bourgeois society, appears only in the period of their dissolution. This very simple category, then, makes a historic appearance in its full intensity only in the most developed conditions of society. By no means does it wade its way through all economic relations. For example, in the Roman Empire, at its highest point of development, the foundation remained taxes and payments in kind. The money system actually completely developed there only in the army. And it never took over the whole of labour. Thus, although the simpler category may have existed historically before the more concrete, it can achieve its full (intensive and extensive) development precisely in a combined form of society, while the more concrete category was more fully developed in a less developed form of society.

Labour seems a quite simple category. The conception of labour in this general form – as labour as such – is also immeasurably old. Nevertheless, when it is economically conceived in this simplicity, ‘labour’ is as modern a category as are the relations which create this simple abstraction. The Monetary System [19] for example, still locates wealth altogether objectively, as an external thing, in money. Compared with this standpoint, the commercial, or manufacture, system took a great step forward by locating the source of wealth not in the object but in a subjective activity – in commercial and manufacturing activity – even though it still always conceives this activity within narrow boundaries, as money-making. In contrast to this system, that of the Physiocrats posits a certain kind of labour – agriculture – as the creator of wealth, and the object itself no longer appears in a monetary disguise, but as the product in general, as the general result of labour. This product, as befits the narrowness of the activity, still always remains a naturally determined product – the product of agriculture, the product of the earth *par excellence.*

It was an immense step forward for Adam Smith to throw out every limiting specification of wealth-creating activity – not only manufacturing, or commercial or agricultural labour, but one as well as the others, labour in general. With the abstract universality of wealth-creating activity we now have the universality of the object defined as wealth, the product as such or again labour as such, but labour as past, objectified labour. How difficult and great was this transition may be seen from how Adam Smith himself from time to time still falls back into the Physiocratic system. Now, it might seem that all that had been achieved thereby was to discover the abstract expression for the simplest and most ancient relation in which human beings – in whatever form of society – play the role of producers. This is correct in one respect. Not in another. Indifference towards any specific kind of labour presupposes a very developed totality of real kinds of labour, of which no single one is any longer predominant. As a rule, the most general abstractions arise only in the midst of the richest possible concrete development, where one thing appears as common to many, to all. Then it ceases to be thinkable in a particular form alone. On the other side, this abstraction of labour as such is not merely the mental product of a concrete totality of labours. Indifference towards specific labours corresponds to a form of society in which individuals can with ease transfer from one labour to another, and where the specific kind is a matter of chance for them, hence of indifference. Not only the category, labour, but labour in reality has here become the means of creating wealth in general, and has ceased to be organically linked with particular individuals in any specific form. Such a state of affairs is at its most developed in the most modern form of existence of bourgeois society – in the United States. Here, then, for the first time, the point of departure of modern economics, namely the abstraction of the category 'labour', 'labour as such', labour pure and simple, becomes true in practice. The simplest abstraction, then, which modern economics places at the head of its discussions, and which expresses an immeasurably ancient relation valid in all forms of society, nevertheless achieves practical truth as an abstraction only as a category of the most modern society. One could say that this indifference towards particular kinds of labour, which is a historic product in the United States, appears e.g. among the Russians as a spontaneous inclination. But there is a devil of a difference between barbarians who are fit by nature to be used for anything, and civilized people who apply themselves to everything. And then in practice the Russian indifference to the specific character of labour corresponds to being embedded by tradition within a very specific kind of labour, from which only external influences can jar them loose.

This example of labour shows strikingly how even the most abstract categories, despite their validity – precisely because of their abstractness – for all epochs, are nevertheless, in the specific character of this abstraction, themselves likewise a product of historic relations, and possess their full validity only for and within these relations.

Bourgeois society is the most developed and the most complex historic organization of production. The categories which express its relations, the comprehension of its structure, thereby also allows insights into the structure and the relations of production of all the vanished social formations out of whose ruins and elements it built itself up, whose partly still unconquered remnants are carried along within it, whose mere nuances have developed explicit significance within it, etc. Human anatomy contains a key to the anatomy of the ape. The intimations of higher development among the subordinate animal species, however, can be understood only after the higher development is already known. The bourgeois economy thus supplies the key to the ancient, etc. But not at all in the manner of those economists who smudge over all historical differences and see bourgeois relations in all forms of society. One can understand tribute, tithe, etc., if one is acquainted with ground rent. But one must not identify them. Further, since bourgeois society is itself only a contradictory form of development, relations derived from earlier forms will often be found within it only in an entirely stunted form, or even travestied. For example, communal property. Although it is true, therefore, that the categories of bourgeois economics possess a truth for all other forms of society, this is to be taken only with a grain of salt. They can contain them in a developed, or stunted, or caricatured form etc., but always with an essential difference. The so-called historical presentation of development is founded, as a rule, on the fact that the latest form regards the previous ones as steps leading up to itself, and, since it is only rarely and only under quite specific conditions able to criticize itself – leaving aside, of course, the historical periods which appear to themselves as times of decadence – it always conceives them one-sidedly. The Christian religion was able to be of assistance in reaching an objective understanding of earlier mythologies only when its own self-criticism had been accomplished to a certain degree, so to speak, δυνάμει. [20] Likewise, bourgeois economics arrived at an understanding of feudal, ancient, oriental economics only after the self-criticism of bourgeois society had begun. In so far as the bourgeois economy did not mythologically identify itself altogether with the past, its critique of the previous economies, notably of feudalism, with which it was still engaged in direct struggle, resembled the critique which Christianity levelled against paganism, or also that of Protestantism against Catholicism.

In the succession of the economic categories, as in any other historical, social science, it must not be forgotten that their subject – here, modern bourgeois society – is always what is given, in the head as well as in reality, and that these categories therefore express the forms of being, the characteristics of existence, and often only individual sides of this specific society, this subject, and that therefore this society by no means begins only at the point where one can speak of it *as such;* this holds *for science as well.* This is to be kept in mind because it will shortly be decisive for the order and sequence of the categories. For example, nothing seems more natural than to begin with ground rent, with landed property, since this is bound up with the earth, the source of all production and of all being, and with the first form of production of all more or less settled societies – agriculture. But nothing would be more erroneous. In all forms of society there is one specific kind of production which predominates over the rest, whose relations thus assign rank and influence to the others. It is a general illumination which bathes all the other colours and modifies their particularity. It is a particular ether which determines the specific gravity of every being which has materialized within it. For example, with pastoral peoples (mere hunting and fishing peoples lie outside the point where real development begins). Certain forms of tillage occur among them, sporadic ones. Landed property is determined by this. It is held in common, and retains this form to a greater or lesser degree according to the greater or lesser degree of attachment displayed by these peoples to their tradition, e.g. the communal property of the Slavs. Among peoples with a settled agriculture – this settling already a great step – where this predominates, as in antiquity and in the feudal order, even industry, together with its organization and the forms of property corresponding to it, has a more or less landed-proprietary character; is either completely dependent on it, as among the earlier Romans, or, as in the Middle Ages, imitates, within the city and its relations, the organization of the land. In the Middle Ages, capital itself – apart from pure money-capital – in the form of the traditional artisans' tools etc., has this landed-proprietary character. In bourgeois society it is the opposite. Agriculture more and more becomes merely a branch of industry, and is entirely dominated by capital. Ground rent likewise. In all forms where landed property rules, the natural relation still predominant. In those where capital rules, the social, historically created element. Ground rent cannot be understood without capital. But capital can certainly be understood without ground rent. Capital is the all-dominating economic power of bourgeois society. It must form the starting-point as well as the finishing-point, and must be dealt with before landed property. After both have been examined in particular, their interrelation must be examined.

It would therefore be infeasible and wrong to let the economic categories follow one another in the same sequence as that in which they were historically decisive. Their sequence is determined, rather, by their relation to one another in modern bourgeois society, which is precisely the opposite of that which seems to be their natural order or which corresponds to historical development. The point is not the historic position of the economic relations in the succession of different forms of society. Even less is it their sequence 'in the idea' (Proudhon) [21] (a muddy notion of historic movement). Rather, their order within modern bourgeois society.

The purity (abstract specificity) in which the trading peoples – Phoenicians, Carthaginians – appear in the old world is determined precisely by the predominance of the agricultural peoples. Capital, as trading-capital or as money-capital, appears in this abstraction precisely where capital is not yet the predominant element of societies. Lombards, Jews take up the same position towards the agricultural societies of the Middle Ages.

As a further example of the divergent positions which the same category can occupy in different social stages: one of the latest forms of bourgeois society, *joint-stock companies.* These also appear, however, at its beginning, in the great, privileged monopoly trading companies.

The concept of national wealth creeps into the work of the economists of the seventeenth century – continuing partly with those of the eighteenth – in the form of the notion that wealth is created only to enrich the state, and that its power is proportionate to this wealth. This was the still unconsciously hypocritical form in which wealth and the production of wealth proclaimed themselves as the purpose of modern states, and regarded these states henceforth only as means for the production of wealth.

The order obviously has to be (1) the general, abstract determinants which obtain in more or less all forms of society, but in the above-explained sense. (2) The categories which make up the inner structure of bourgeois society and on which the fundamental classes rest. Capital, wage labour, landed property. Their interrelation. Town and country. The three great social classes. Exchange between them. Circulation. Credit system (private). (3) Concentration of bourgeois society in the form of the state. Viewed in relation to itself. The ‘unproductive’ classes. Taxes. State debt. Public credit. The population. The colonies. Emigration. (4) The international relation of production. International division of labour. International exchange. Export and import. Rate of exchange. (5) The world market and crises. [22]

(4) PRODUCTION. MEANS OF PRODUCTION AND RELATIONS OF PRODUCTION. RELATIONS OF PRODUCTION AND RELATIONS OF CIRCULATION. FORMS OF THE STATE AND FORMS OF CONSCIOUSNESS IN RELATION TO RELATIONS OF PRODUCTION AND CIRCULATION. LEGAL RELATIONS. FAMILY RELATIONS.

Notabene in regard to points to be mentioned here and not to be forgotten:

(1) *War* developed earlier than peace; the way in which certain economic relations such as wage labour, machinery etc. develop earlier, owing to war and in the armies etc., than in the interior of bourgeois society. The relation of productive force and relations of exchange also especially vivid in the army.

(2) *Relation of previous ideal historiography to the real. Namely of the so-called cultural histories,* which are only histories of religions and of states. (On that occasion something can also be said about the various kinds of previous historiography. The so-called objective. Subjective (moral among others). The philosophical.)

(3) *Secondary and tertiary* matters; in general, *derivative, inherited,* not original relations of production. Influence here of international relations.

(4) *Accusations about the materialism of this conception. Relation to naturalistic materialism.*

(5) *Dialectic of the concepts productive force (means of production) and relation of production,* a dialectic whose boundaries are to be determined, and which does not suspend the real difference.

(6) *The uneven development of material production relative to e.g. artistic development.* In general, the concept of progress not to be conceived in the usual abstractness. Modern art etc. This disproportion not as important or so difficult to grasp as within practical-social relations themselves. E.g. the relation of education. Relation of the *United States* to Europe. But the really difficult point to discuss here is how relations of production develop unevenly as legal relations. Thus e.g. the relation of Roman private law (this less the case with criminal and public law) to modern production.

(7) *This conception appears as necessary development.* But legitimation of chance. How. (Of freedom also, among other things.) (Influence of means of communication. World history has not always existed; history as world history a result.)

(8) *The point of departure obviously from the natural characteristic;* subjectively and objectively. Tribes, races etc.

(1) In the case of the arts, it is well known that certain periods of their flowering are out of all proportion to the general development of society, hence

also to the material foundation, the skeletal structure as it were, of its organization. For example, the Greeks compared to the moderns or also Shakespeare. It is even recognized that certain forms of art, e.g. the epic, can no longer be produced in their world epoch-making, classical stature as soon as the production of art, as such, begins; that is, that certain significant forms within the realm of the arts are possible only at an undeveloped stage of artistic development. If this is the case with the relation between different kinds of art within the realm of the arts, it is already less puzzling that it is the case in the relation of the entire realm to the general development of society. The difficulty consists only in the general formulation of these contradictions. As soon as they have been specified, they are already clarified.

Let us take e.g. the relation of Greek art and then of Shakespeare to the present time. It is well known that Greek mythology is not only the arsenal of Greek art but also its foundation. Is the view of nature and of social relations on which the Greek imagination and hence Greek [mythology] is based possible with self-acting mule spindles and railways and locomotives and electrical telegraphs? What chance has Vulcan against Roberts and Co., Jupiter against the lightning-rod and Hermes against the Crédit Mobilier? All mythology overcomes and dominates and shapes the forces of nature in the imagination and by the imagination; it therefore vanishes with the advent of real mastery over them. What becomes of Fama alongside Printing House Square? Greek art presupposes Greek mythology, i.e. nature and the social forms already reworked in an unconsciously artistic way by the popular imagination. This is its material. Not any mythology whatever, i.e. not an arbitrarily chosen unconsciously artistic reworking of nature (here meaning everything objective, hence including society). Egyptian mythology could never have been the foundation or the womb of Greek art. But, in any case, a *mythology.* Hence, in no way a social development which excludes all mythological, all mythologizing relations to nature; which therefore demands of the artist an imagination not dependent on mythology.

From another side: is Achilles possible with powder and lead? Or the *Iliad* with the printing press, not to mention the printing machine? Do not the song and the saga and the muse necessarily come to an end with the printer’s bar, hence do not the necessary conditions of epic poetry vanish?

But the difficulty lies not in understanding that the Greek arts and epic are bound up with certain forms of social development. The difficulty is that they still afford us artistic pleasure and that in a certain respect they count as a norm and as an unattainable model.

A man cannot become a child again, or he becomes childish. But does he not find joy in the child’s naïvité, and must he himself not strive to reproduce its truth at a higher stage? Does not the true character of each epoch come alive in the nature of its children? Why should not the historic childhood of humanity, its most beautiful unfolding, as a stage never to return, exercise an eternal charm? There are unruly children and precocious children. Many of the old peoples belong in this category. The Greeks were normal children. The charm of their art for us is not in contradiction to the undeveloped stage of society on which it grew. [It] is its result, rather, and is inextricably bound up, rather, with the fact that the unripe social conditions under which it arose, and could alone arise, can never return.

NOTEBOOK I

October 1857

The Chapter on Money

Alfred Darimon, *De la réforme des banques*, Paris, 1856. [1]

‘The root of the evil is the predominance which opinion obstinately assigns to the role of the precious metals in circulation and exchange.’ (pp. 1, 2.) [2]

Begins with the measures which the Banque de France adopted in October 1855 to ‘stem the progressive diminution of its reserves.’ (p. 2.) Wants to give us a statistical tableau of the condition of this bank during the six months preceding its October measures. To this end, compares its bullion assets during these three months and the *‘fluctuations du portefeuille’*, i.e. the quantity of discounts extended by the bank (commercial papers, *bills of exchange* in its portfolio). The figure which expresses the value of the securities held by the bank, ‘represents’, according to Darimon, ‘the greater or lesser need felt by the public for its services, or, *which amounts to the same thing, the requirements of circulation’.* (p. 2.) Amounts to the same thing? Not at all. If the mass of bills presented for discount were identical with the ‘requirements of circulation’, of *monetary turnover* in the proper sense, then the turnover of banknotes would have to be determined by the quantity of discounted bills of exchange. But this movement is on the average not only not parallel, but often an inverse one. The quantity of discounted bills and the fluctuations in this quantity express the requirements of credit, whereas the quantity of money in circulation is determined by quite different influences. In order to reach any conclusions about circulation at all, Darimon would above all have had to present a column showing the amount of notes in circulation next to the column on bullion assets and the column on discounted bills. In order to discuss the requirements of circulation, it did not require a very great mental leap to look first of all at the fluctuations in circulation proper. The omission of this necessary link in the equation immediately betrays the bungling of the dilettante, and the intentional muddling together of the requirements of credit with those of monetary circulation – a confusion on which rests in fact the whole secret of Proudhonist wisdom. (A mortality chart listing illnesses on one side and deaths on the other, but forgetting births.) The two columns (see p. 3) given by Darimon, i.e. the bank’s metallic assets from April to September on the one side, the movement of its portfolio on the other, express nothing but the tautological fact, which requires no display of statistical illustration, that the bank's portfolio filled up with bills of exchange and its vaults emptied of metal in proportion as bills of exchange were presented to it for the purpose of withdrawing metal. And the table which Darimon offers to prove this tautology does not even demonstrate it in a pure form. It shows, rather, that the metallic assets of the bank declined by about 144 million between 12 April and 13 September 1855, while its portfolio holdings increased by about 101 million. The decline in bullion thus exceeded the rise in discounted commercial papers by 43 million. The identity of both movements is wrecked against this net imbalance at the end of six months. A more detailed comparison of the figures shows us additional incongruities.

Metal in bank	*Paper discounted by bank*
12 April – 432,614,799 fr.	12 April – 322,904,313
10 May – 420,914,028	10 May – 310,744,925

In other words: between 12 April and 10 May, the metal assets decline by 11,700,769, while the amount of securities increases by 12,159,388; i.e. the increase of securities exceeds the decline of metal by about half a million (458,619 fr.). [3] The opposite finding, but on a far more surprising scale, appears when we compare the months of May and June:

Metal in bank	*Paper discounted by bank*
10 May – 420,914,028	10 May – 310,744,925
14 June – 407,769,813	14 June – 310,369,439

That is, between 10 May and 14 June the metal assets of the bank declined by 13,144,225 fr. Did its securities increase to the same degree? On the contrary, they fell during the same period by 375,486 fr. Here, in other words, we no longer have a merely quantitative disproportion between the decline on one side and the rise on the other. Even the inverse relation of both movements has disappeared. An enormous decline on one side is accompanied by a relatively weak decline on the other.

Metal in bank	*Paper discounted by bank*
14 June – 407,769,813	14 June – 310,369,439
12 July – 314,629,614	12 July – 381,699,256

Comparison of the months June and July shows a decline of metal assets by 93,140,199 and an increase of securities by 71,329,817; i.e. the decline in metal assets is 21,810,382 greater than the increase of the portfolio.

Metal in bank	*Paper discounted by bank*
12 July – 314,629,614	12 July – 381,699,256
9 August – 338,784,444	9 August – 458,689,605

Here we see an increase on both sides; metal assets by 24,154,830, and on the portfolio side the much more significant 76,990,349.

Metal in bank	*[Paper discounted by bank]*
9 August – 338,784,444	9 August – 458,689,605
13 Sept. – 288,645,333	[13 Sept.] – 431,390,562

The decline in metal assets of 50,139,111 fr. is here accompanied by a decline in securities of 27,299,043 fr. (Despite the restrictive measures adopted by the Banque de France, its reserves again declined by 24 million in December 1855.)

What's sauce for the gander is sauce for the goose. The conclusions that emerge from a sequential comparison of the six-month period have the same claim to validity as those which emerge from Mr Darimon's comparison of the beginning of the series with its end. And what does the comparison show? Conclusions which reciprocally devour each other. Twice, the portfolio increases more rapidly than the metal assets decrease (April-May, June-July). Twice the metal assets and the portfolio both decline, but the former more rapidly than the latter (May – June, August-September). Finally, during one period both metal assets and the portfolio increase, but the latter more rapidly than the former. Decrease on one side, increase on the other; decrease on both sides; increase on both sides; in short, everything except a lawful regularity, above all no inverse correlation, not even an interaction, since a decline in portfolio cannot be the cause of a decline in metal assets, and an increase in portfolio cannot be the cause of an increase in metal assets. An inverse relation and an interaction are not even demonstrated by the isolated comparison which Darimon sets up between the first and last months. Since the increase in portfolio by 101 million does not cover the decrease in metal assets, 144 million, then the possibility remains open that there is no causal link whatever between the increase on one side and the decrease on the other. Instead of providing a solution, the statistical illustration threw up a quantity of intersecting questions; instead of one puzzle, a bushelful. These puzzles, it is true, would disappear the moment Mr Darimon presented columns on circulation of banknotes and on deposits next to his columns on metal assets and portfolio (discounted paper). An increase in portfolio more rapid than a decrease in metal would then be explained by a simultaneous increase in metallic deposits or by the fact that a portion of the banknotes issued in exchange for discounted paper was not converted into metal but remained instead in circulation, or, finally, that the issued banknotes immediately returned in the form of deposits or in repayment of due bills, without entering into circulation. A decrease in metal assets accompanied by a lesser decrease in portfolio could be explained by the withdrawal of deposits from the bank or the presentation of banknotes for conversion into metal, thus adversely affecting the bank's discounts through the agency of the owners of the withdrawn deposits or of the metallized notes. Finally, a lesser decline in metal assets accompanied by a lesser decline in portfolio could be explained on the same grounds (we entirely leave out of consideration the possibility of an outflow of metal to replace silver currency inside the country, since Darimon does not bring it into the field of his observations). But a table whose columns would have explained one another reciprocally in this manner would have proved what was not supposed to be proved, namely that the fulfillment by the bank of increasing commercial needs does not necessarily entail an increase in the turnover of its notes, that the increase or decrease of this turnover does not correspond to the increase or decrease of its metallic assets, that the bank does not control the quantity of the means of circulation, etc. – a lot of conclusions which did not fit in with Mr Darimon's intent. In his hasty effort to present in the most lurid colours his preconceived opinion that the metal basis of the bank, represented by its metallic assets, stands in contradiction to the requirements of circulation, which, in his view, are represented by the bank's portfolio, he tears two columns of figures out of their necessary context with the result that this isolation deprives the figures of all meaning or, at the most, leads them to testify against him. We have dwelt on this *fact* in some detail in order to make clear with one example what the entire worth of the statistical and positive illustrations of the Proudhonists amounts to. Economic facts do not furnish them with the test of their theories; rather, they furnish the proof of their lack of mastery of the facts, in order to be able to play with them. Their manner of playing with the facts shows, rather, the genesis of their theoretical abstractions.

Let us pursue Darimon further.

When the Bank of France saw its metal assets diminished by 144 million and its portfolio increased by 101 million, it adopted, on 4 and 18 October 1855, a set of measures to defend its vaults against its portfolio. It raised its discount rate successively from 4 to 5 and from 5 to 6% and reduced the time of payment of bills presented for discount from 90 to 75 days. In other words: it raised the terms on which it made its metal available to commerce. What does this demonstrate? 'That a bank', says Darimon, 'organized on present principles, i.e. on the rule of gold and silver, withdraws its services from the public precisely at the moment when the public most needs them.' Did Mr Darimon require his figures to prove that supply increases the cost of its services to the same degree as demand makes claims upon them (and exceeds them)? And do not the gentlemen who represent the 'public' *vis-à-vis* the bank follow the same 'agreeable customs of life'? The philanthropic grain merchants who present their bills to the bank in order to receive notes, in order to exchange the notes for the bank's gold, in order to exchange the bank's gold for another country's grain, in order to exchange the grain of another country for the money of the French public – were they perhaps motivated by the idea that, since the public then had the greatest need of grain, it was therefore their duty to let them have grain on easier terms, or did they not rather rush to the bank in order to exploit the increase of grain prices, the misery of the public and the disproportion between its supply and its demand? And the bank should be made an exception to these general economic laws? *Quelle idée!* But perhaps the present organization of the banks has as its consequence that gold must be piled up in great quantity so that the means of purchase, which, in case of insufficient grain, could have the greatest utility for the nation, should be condemned to lie fallow; in short, so that capital, instead of passing through the necessary transformation of production, becomes the unproductive and lazy basis of circulation. In this case the problem would be, then, that the unproductive stock of metal still stands above its necessary minimum within the present system of bank organization, because hoarding of the gold and silver in circulation has not yet been restricted to its economic limits. It is a question of something more or something less, but on the same foundation. But then the question would have been deflated from the socialist heights down to the practical bourgeois plains where we find it promenading among the majority of the English bourgeois opponents of the Bank of England. What a come-down! Or is the issue not a greater or lesser saving of metal by means of banknotes and other bank arrangements, but a departure from the metal basis altogether? But then the statistical fable is worthless again, as is its moral. If, for any reason whatever, the bank must send precious metals to other countries in case of need, then it must first accumulate them, and if the other country is to accept these metals in exchange for its commodities, then the predominance of the metals must first have been secured.

The causes of the precious metals' flight from the bank, according to Darimon, were crop failures and the consequent need to import grain from abroad. He forgets the failure of the silk harvest and the need to purchase it in vast quantities from China. Darimon further cites the numerous great undertakings coinciding with the last months of the industrial exhibition in Paris. Again he forgets the great speculations and ventures abroad launched by the Crédit Mobilier and its rivals for the purpose of showing, as Isaac Péreire [4] says, that French capital is as distinguished among capitals by its cosmopolitan nature as is the French language among languages. Plus the unproductive expenditures entailed by the Crimean War: borrowings of 750 million. That is, on one side, a great and unexpected collapse in two of the most important branches of French production! On the other, an unusual employment of French capital in foreign markets for undertakings which by no means immediately paid their way and which in part will perhaps never cover their costs of production! In order to balance the decrease of domestic production by means of imports, on the one side, and the increase of industrial undertakings abroad on the other side, what would have been required were not symbols of circulation which facilitate the exchange of equivalents, but these equivalents themselves; not money but capital. The losses in French domestic production, in any case, were not an equivalent for the employment of French capital abroad. Now suppose that the Bank of France did not rest on a metallic base, and that other countries were willing to accept the French currency or its capital in any form, not only in the specific form of the precious metals. Would the bank not have been equally forced to raise the terms of its discounting precisely at the moment when its ‘public’ clamoured most eagerly for its services? The notes with which it discounts the bills of exchange of this public are at present nothing more than drafts on gold and silver. In our hypothetical case, they would be drafts on the nation’s stock of products and on its directly employable labour force: the former is limited, the latter can be increased only within very positive limits and in certain amounts of time. The printing press, on the other hand, is inexhaustible and works like a stroke of magic. At the same time, while the crop failures in grain and silk enormously diminish the directly exchangeable wealth of the nation, the foreign railway and mining enterprises freeze the same exchangeable wealth in a form which creates no direct equivalent and therefore devours it, for the moment, without replacement! Thus, the directly exchangeable wealth of the nation (i.e. the wealth which can be circulated and is acceptable abroad) absolutely diminished! On the other side, an unlimited increase in bank drafts. Direct consequence: increase in the price of products, raw materials and labour. On the other side, decrease in price of bank drafts. The bank would not have increased the wealth of the nation through a stroke of magic, but would merely have undertaken a very ordinary operation to devalue its own paper. With this devaluation, a sudden paralysis of production! But no, says the Proudhonist. Our new organization of the banks would not be satisfied with the negative accomplishment of abolishing the metal basis and leaving everything else the way it was. It would also create entirely new conditions of production and circulation, and hence its intervention would take place under entirely new preconditions. Did not the introduction of our present banks, in its day, revolutionize the conditions of production? Would large-scale modern industry have become possible without this new financial institution, without the concentration of credit which it created, without the state revenues which it created in antithesis to ground rent, without finance in antithesis to landed property, without the moneyed interest in antithesis to the landed interest; without these things could there have been stock companies etc., and the thousand forms of circulating paper which are as much the preconditions as the product of modern commerce and modern industry?

We have here reached the fundamental question, which is no longer related to the point of departure. The general question would be this: Can the existing relations of production and the relations of distribution which correspond to them be revolutionized by a change in the instrument of circulation, in the organization of circulation? Further question: Can such a transformation of circulation be undertaken without touching the existing relations of production and the social relations which rest on them? If every such transformation of circulation presupposes changes in other conditions of production and social upheavals, there would naturally follow from this the collapse of the doctrine which proposes tricks of circulation as a way of, on the one hand, avoiding the violent character of these social changes, and, on the other, of making these changes appear to be not a presupposition but a gradual result of the transformations in circulation. An error in this fundamental premise would suffice to prove that a similar misunderstanding has occurred in relation to the inner connections between the relations of production, of distribution and of circulation. The above-mentioned historical case cannot of course decide the matter, because modern credit institutions were as much an effect as a cause of the concentration of capital, since they only form a moment of the latter, and since concentration of wealth is accelerated by a scarcity of circulation (as in ancient Rome) as much as by an increase in the facility of circulation. It should further be examined, or rather it would be part of the general question, whether the different civilized forms of money – metallic, paper, credit money, labour money (the last-named as the socialist form) – can accomplish what is demanded of them without suspending the very relation of production which is expressed in the category money, and whether it is not a self-contradictory demand to wish to get around essential determinants of a relation by means of formal modifications? Various forms of money may correspond better to social production in various stages; one form may remedy evils against which another is powerless; but none of them, as long as they remain forms of money, and as long as money remains an essential relation of production, is capable of overcoming the contradictions inherent in the money relation, and can instead only hope to reproduce these contradictions in one or another form. One form of wage labour may correct the abuses of another, but no form of wage labour can correct the abuse of wage labour itself. One lever may overcome the inertia of an immobile object better than another. All of them require inertia to act at all as levers. This general question about the relation of circulation to the other relations of production can naturally be raised only at the end. But, from the outset, it is suspect that Proudhon and his associates never even raise the question in its pure form, but merely engage in occasional declamations about it. Whenever it is touched on, we shall pay close attention.

This much is evident right at the beginning of Darimon, namely that he completely identifies *monetary turnover* with *credit,* which is economically wrong. (The notion of *crédit gratuit,* incidentally, is only a hypocritical, philistine and anxiety-ridden form of the saying: property is theft. Instead of the workers *taking* the capitalists' capital, the capitalists are supposed to be compelled to give it to them.) This too we shall have to return to.

In the question under discussion now, Darimon got no further than the point that banks, which deal in credit, like merchants who deal in commodities or workers who deal in labour, sell at a higher price when demand rises in relation to supply, i.e. they make their services more difficult for the public to obtain at the very moment the public has the greatest need for them. We saw that the bank has to act in this way whether the notes it issues are convertible or inconvertible.

The behaviour of the Bank of France in October 1855 gave rise to an 'immense clamour' (p. 4) and to a 'great debate' between it and the spokesmen of the public. Darimon summarizes, or pretends to summarize, this debate. We will follow him here only occasionally, since his synopsis displays the weak sides of both opponents, revealed in their constant desultory irrelevances. Groping about in extrinsic arguments. Each of the antagonists is at every moment dropping his weapon in order to search for another. Neither gets to the point of striking any actual blows, not only because they are constantly changing the weapons with which they are supposed to hit each other, but also because they hardly meet on one terrain before they take rapid flight to another.

(The discount rate in France had not been raised to 6% since 1806: for 50 years the time of payment for commercial bills of exchange had stood firm at 90 days.)

The weakness of the bank's defending arguments, as presented by Darimon, and his own misconceptions, emerge for example from the following passage in his fictitious dialogue:

Says the bank's opponent: 'By virtue of your monopoly you are the dispenser and regulator of credit. When you take up an attitude of severity, the discounters not only imitate you but they further exaggerate your rigour … Your measures have brought business to a standstill.' (p. 5.)

The bank replies, and indeed 'humbly': '"What would you have me do?" the bank humbly said … "To defend myself against the foreigner, I have to defend myself against our citizens … Above all I must prevent the outflow of the currency, without which I am nothing and can do nothing."' (p. 5.)

The bank's script is ridiculous. It is made to sidetrack the question, to turn it into a rhetorical generality, in order to be able to answer it with a rhetorical generality. In this dialogue the bank is made to share Darimon's illusion that its monopoly really allows it to regulate credit. In fact the power of the bank begins only where the private 'discounters' stop, hence at a moment when its power is already extraordinarily limited. Suppose that during easy conditions on the money market, when everybody else is discounting at 2 1/2%, the bank holds at 5%; instead of imitating it, the discounters will discount all its business away before its very eyes. Nowhere is this more vividly demonstrated than in the history of the Bank of England since the law of 1844, which made it into a real rival of the private bankers in the business of discounting, etc. In order to secure for itself a share, and a growing share, of the discount business during the periods of easiness on the money market, the Bank of England was constantly forced to reduce its rates not only to the level adopted by the private bankers but often below it. Its 'regulation of credit' is thus to be taken with a grain of salt; Darimon, however, makes his superstitious faith in its absolute control of the money market and of credit into his point of departure.

Instead of analysing critically the determinants of the bank's real power over the money market, he immediately grabs on to the phrase that cash is everything for the bank and that it has to prevent its outflow from the country. A professor of the Collège de France (Chevalier) [5] replies: 'Gold and silver are commodities like any other … The only purpose of the bank's metallic reserves is to make purchases abroad in moments of emergency.' The bank rejoins: 'Metallic money is not a commodity like any other; it is an instrument of exchange, and by virtue of this title it holds the privilege of prescribing laws for all the other commodities.' Now Darimon leaps between the combatants: 'Thus the privilege held by gold and silver, that of being the only authentic instrument of circulation and exchange, is responsible not only for the present crisis, but for the periodic commercial crises as well.' In order to control all the undesirable features of crises 'it would be enough that gold and silver were made commodities like any other, or, precisely expressed, that all commodities were made instruments of exchange on an equal footing (*au même titre*) with gold and silver; that products were truly exchanged for products'. (pp. 5–7.)

Shallowness with which the disputed question is presented here. If the bank issues drafts on money (notes) and promissory notes on capital repayable in gold (or silver) (deposits), then it is self-evident that it can watch and endure the decrease of its metal reserves only up to a certain point without reacting. That has nothing to do with the theory of metallic money. We will return to Darimon's theory of crises later.

In the chapter "Short History of the Crises of Circulation", Mr Darimon omits the English crisis of 1809–11 and confines himself to noting the appointment of the Bullion Committee in 1810; and for 1811 he again leaves out the crisis itself (which began in 1809), and merely mentions the adoption by the House of Commons of the resolution that 'the depreciation of notes relative to bullion stems not from a depreciation of paper money but from an increase in the price of bullion', together with Ricardo's pamphlet which maintains the opposite thesis, the conclusion of which is supposed to read: 'A currency is in its most perfect state when it consists wholly of paper money.' (pp. 22, 23.) [6] The crises of 1809 and 1811 were important here because the bank at that time issued inconvertible notes, meaning that the crises did not stem from the convertibility of notes into gold (metal) and hence could not be restrained by the abolition of convertibility. Like a nimble tailor, Darimon skips over these facts which contradict his theory of crises. He clutches on to Ricardo's aphorism, which had nothing to do with the real subject of discussion in the pamphlet, namely the depreciation of banknotes. He is unaware that Ricardo's theory of money is as completely refuted as its false assumptions that the bank controls the quantity of notes in circulation, and that the quantity of means of circulation determines prices, whereas on the contrary prices determine the quantity of means of circulation etc. In Ricardo's time all detailed studies of the phenomena of monetary circulation were still lacking. This by the way.

Gold and silver are commodities like the others. Gold and silver are not commodities like the others: as general instruments of exchange they are the privileged commodities and degrade the other commodities by virtue of this privilege. This is the last analysis to which Darimon reduces the antagonism. His final judgement is: abolish the privilege of gold and silver, degrade them to the rank of all other commodities. Then you no longer have the specific evils of gold and silver money, or of notes convertible into gold and silver. You abolish all evils. Or, better, elevate all commodities to the monopoly position now held by gold and silver. Let the pope remain, but make everybody pope. Abolish money by making every commodity money and by equipping it with the specific attributes of money. The question here arises whether this problem does not already pronounce its own nonsensicality, and whether the impossibility of the solution is not already contained in the premises of the question. Frequently the only possible answer is a critique of the question and the only solution is to negate the question. The real question is: does not the bourgeois system of exchange itself necessitate a specific instrument of exchange? Does it not necessarily create a specific equivalent for all values? One form of this instrument of exchange or of this equivalent may be handier, more fitting, may entail fewer inconveniences than another. But the inconveniences which arise from the existence of every specific instrument of exchange, of any specific but general equivalent, must necessarily reproduce themselves in every form, however differently. Darimon naturally skips over this question with enthusiasm. Abolish money and don't abolish money! Abolish the exclusive privilege possessed by gold and silver in virtue of their exclusive monetary role, but turn all commodities to money, i.e. give them all together equally a quality which no longer exists once its exclusiveness is gone.

The bullion drains do in fact bring to the surface a contradiction which Darimon formulates superficially and distorts as well. It is evident that gold and silver are not commodities like the others, and that modern economics is horrified to see itself suddenly and temporarily thrown back again and again to the prejudices of the Mercantile System. The English economists attempt to overcome the difficulty by means of a distinction. What is demanded in moments of such monetary crises, they say, is not gold and silver as money, not gold and silver as coin, but gold and silver as capital. They forget to add: yes, capital, but capital in the specific form of gold and silver. Why else is there an outflow of precisely these commodities, while most of the others depreciate owing to lack of outflow, if capital were exportable in every form?

Let us take specific examples: drain as a result of domestic harvest failures in a chief food crop (e.g. grain), crop failure abroad and hence increased prices in one of the main imported consumer goods (e.g. tea); drain because of a crop failure in decisive industrial raw materials (cotton, wool, silk, flax etc.); drain because of excessive imports (caused by speculation, war etc.). The replacement of a sudden or chronic shortage (grain, tea, cotton, flax, etc.) in the case of a domestic crop failure deprives the nation doubly. A part of its invested capital or labour is not reproduced – real loss of production. A part of that capital which has been reproduced has to be shifted to fill this gap; and this part, moreover, does not stand in a simple arithmetical relation to the loss, because the deficient product rises and must rise on the world market as a result of the decreased supply and the increased demand. It is necessary to analyse precisely how such crises would look if money were disregarded, and what determinants money introduces into the given relations. (*Grain crop failures* and *excess imports* the most important cases. The impact of war is self-evident, since economically it is exactly the same as if the nation were to drop a part of its capital into the ocean.)

Case of a grain crop failure: Seen in comparison to other nations, it is clear that the nation's capital (not only its real wealth) has diminished, just as clear as that a peasant who burns his loaves and has to buy bread at the baker's is impoverished to the extent of the price of his purchase. In reference to the domestic situation, the rise in grain prices, as far as value enters into the question, seems to leave everything as it was. Except for the fact that the lesser quantity of grain multiplied by the increased price, in real crop failures, never = the normal quantity multiplied by the lesser price. Suppose that the entire English wheat crop were 1 quarter, and that this 1 quarter fetched the same price as 30 million quarters previously. Then, leaving aside the fact that it lacks the means to reproduce either life or wheat, and if we postulate that the working day necessary to produce 1 quarter = A, then the nation would exchange A × 30 million working days (cost of production) for 1 × A working days (product); the productive force of its capital would have diminished by millions and the sum of all values in the land would have diminished, since every working day would have depreciated by a factor of 30 million. Every unit of capital would then represent only 1/30,000,000 of its earlier value, of its equivalent in production costs, even though in this given case the nominal value of the nation's capital would not have diminished (apart from the depreciation of land and soil), since the decrease in value of all other products would have been exactly compensated by the increase in value of the 1 quarter of wheat. The increase in the wheat price by a factor of A × 30 million would be the expression of an equivalent depreciation of all other products. This distinction between domestic and foreign, incidentally, is altogether illusory. The relation between the nation which suffers a crop failure and another nation where the former makes purchases is like that between every individual of the nation and the farmer or grain merchant. The surplus sum which it must expend in purchasing grain is a direct subtraction from its capital, from its disposable means.

So as not to obscure the question with unessential influences, it must be postulated that the nation has free trade in grain. Even if the imported grain were as cheap as the domestically produced grain, the nation would still be poorer to the amount of capital not reproduced by the farmers. However, on the above assumption of free trade, the nation always imports as much foreign grain as is possible at the normal price. The increase of imports thus presupposes a rise in the price.

The rise in the grain price is = to the fall in the price of all other commodities. The increased cost of production (represented by the price) at which the quarter of wheat is obtained is = to the decreased productivity of capital in all other forms. The surplus used to purchase grain must correspond to a deficit in the purchase of all other products and hence already a decline in their prices. With or without metallic money, or money of any other kind, the nation would find itself in a crisis not confined to grain, but extending to all other branches of production, not only because their productivity would have positively diminished and the price of their production depreciated as compared to their value, which is determined by the normal cost of production, but also because all contracts, obligations etc. rest on the average prices of products. For example, *x* bushels of grain have to be supplied to service the state's indebtedness, but the cost of producing these *x* bushels has increased by a given factor. Quite apart from the role of money the nation would thus find itself in a general crisis. If we abstract not only from money but from exchange value as well, then products would have depreciated and the nation's productivity diminished while all its economic relations are based on the average productivity of its labour.

A crisis caused by a failure in the grain crop is therefore not at all created by the drain of bullion, although it can be aggravated by obstacles set up to impede this drain.

In any case, we cannot agree with Proudhon either when he says that the crisis stems from the fact that the precious metals alone possess an authentic value in contrast to the other commodities; for the rise in the grain price first of all means only that more gold and silver have to be given in exchange for a certain quantity of grain, i.e. that the price of gold and silver has declined relative to the price of grain. Thus gold and silver participate with all other commodities in the depreciation relative to grain, and no privilege protects them from this. The depreciation of gold and silver relative to grain is identical with the rise of the grain price (not quite correct. The quarter of grain rises from 50s. to 100s., i.e. by 100%, but cotton goods fall by 80. Silver has declined by 50 relative to grain; cotton goods (owing to declining demand etc.) have declined by 80% relative to it. That is to say, the prices of other commodities fall to a greater extent than those of grain rise. But the opposite also occurs. For example in recent years, when grain temporarily rose by 100%, it never entered the heads of the industrial products to decline in the same proportion in which gold had declined relative to grain. This circumstance does not immediately affect the general thesis). Neither can it be said that gold possesses a privilege because its quantity is precisely and authentically defined in the coin form. One thaler (silver) remains under all circumstances one thaler. But a bushel of wheat is also always a bushel, and a yard of linen a yard.

The depreciation of most commodities (labour included) and the resultant crisis, in the case of an important crop mishap, cannot therefore be crudely ascribed to the export of gold, because depreciation and crisis would equally take place if no gold whatever were exported and no grain imported. The crisis reduces itself simply to the law of supply and demand, which, as is known, acts far more sharply and energetically within the sphere of primary needs – seen on a national scale – than in all other spheres. Exports of gold are not the cause of the grain crisis, but the grain crisis is the cause of gold exports.

Gold and silver in themselves can be said to intervene in the crisis and to aggravate its symptoms in only two ways: (1) When the export of gold is made more difficult by the metal reserve requirements to which the banks are bound; when the measures which the banks therefore undertake against the export of gold react disadvantageously on domestic circulation; (2) When the export of gold becomes necessary because foreign nations will accept capital only in the form of gold and not otherwise.

Difficulty No. 2 can remain even if difficulty No. 1 is removed. The Bank of England experienced this precisely during the period when it was legally empowered to issue inconvertible notes. [7] These notes declined in relation to gold bullion, but the mint price of gold likewise declined in relation to its bullion price. In relation to the note, gold had become a special kind of commodity. It can be said that the note still remained dependent on gold only to the extent that it nominally represented a certain quantity of gold for which it could not in fact be exchanged. Gold remained its denomination, although it was no longer legally exchangeable for this quantity of gold at the bank.

There can be hardly a doubt (?) (this is to be examined later and does not directly belong with the subject under discussion) that as long as paper money retains its denomination in gold (i.e. so long as a £5 note for example is the paper representative of 5 sovereigns), the convertibility of the note into gold remains its economic law, whether this law also exists *politically* or not. The Bank of England's notes continued during the years 1799–1819 to state that they represented the value of a given quantity of gold. How can this assertion be put to the test other than by the fact that the note indeed commands so-and-so-much bullion? From the moment when bullion to the value of 5 sovereigns could no longer be had for a £5 note, the note was depreciated even though it was inconvertible. The equivalence of the note with an amount of gold equal to its face-value immediately entered into contradiction with the factual non-equivalence between banknotes and gold. The point in dispute among the English who want to keep gold as the denomination of notes is not in fact the convertibility of the note into gold – which is only the practical equivalence of what the face of the note expresses theoretically – but rather the question how this convertibility is to be secured, whether through limits imposed by law on the bank or whether the bank is to be left to its own devices. The advocates of the latter course assert that this convertibility is achieved on the average by a bank of issue which lends against bills of exchange and whose notes thus have an assured reflux, and charge that their opponents despite everything never achieved better than this average measure of security. The latter is a fact. The average, by the way, is not to be despised, and calculations on the basis of averages have to form the basis for banks just as well as for all insurance companies etc. In this regard the Scottish banks are above all, and rightly, held up as a model. The strict bullionists say for their part that they take convertibility as a serious matter, that the bank's obligation to convert notes keeps the notes convertible, that the necessity of this convertibility is given by the denomination of the notes themselves, that this forms a barrier against over-issue, and that their opponents are pseudo-defenders of inconvertibility. Between these two sides, various shadings, a mass of little 'species'. [8] The defenders of inconvertibility, finally, the determined anti-bullionists, are, without knowing it, just as much pseudo-defenders of convertibility as their opponents are of inconvertibility, because they retain the denomination of the note and hence make the practical equation between a note of a given denomination and a given quantity of gold the measure of their notes' full value. Prussia has paper money of forced currency. (A reflux is secured by the obligation to pay a portion of taxes in paper.) These paper thalers are not drafts on silver; no bank will legally convert them. They are not issued by a commercial bank against bills of exchange but by the government to meet its expenses. But their denomination is that of silver. A paper thaler proclaims that it represents the same value as a silver thaler. If confidence in the government were to be thoroughly shaken, or if this paper money were issued in greater proportions than required by circulation, then the paper thaler would in practice cease to be equal to the silver thaler and would be depreciated because it had fallen beneath the value proclaimed on its face. It would even depreciate if neither of the above conditions obtained but if a special need for silver, e.g. for exports, gave silver a privileged position *vis-à-vis* the paper thaler. Convertibility into gold and silver is therefore the practical measure of the value of every paper currency denominated in gold or silver, whether this paper is legally convertible or not. Nominal value runs alongside its body as a mere shadow; whether the two balance can be shown only by actual convertibility (exchangeability). A fall of real value beneath nominal value is depreciation. Convertibility is when the two really run alongside each other and change places with each other. The convertibility of inconvertible notes shows itself not in the bank's stock of bullion but in the everyday exchange between paper and the metal whose denomination the paper carries. In practice, the convertibility of convertible notes is already endangered when this is no longer confirmed by everyday routine exchange in all parts of the country, but has to be established specifically by large-scale operations on the part of the bank. In the Scottish countryside paper money is even preferred to metal money. Before 1845, when the English law of 1844 [9] was forced upon it, Scotland naturally took part in all English social crises, and experienced some crises to a higher degree because the clearing of the land proceeded more ruthlessly there. Nevertheless, Scotland never experienced a real monetary crisis (the fact that a few banks, exceptions, collapsed because they had made careless loans is irrelevant here); no depreciation of notes, no complaints and no inquiries into the sufficiency or insufficiency of the currency in circulation etc. Scotland is important here because it shows on the one hand how the monetary system can be completely regulated on the present basis – all the evils Darimon bewails can be abolished – without departing from the present social basis; while at the same time its contradictions, its antagonisms, the class contradiction etc. have reached an even higher degree than in any other country in the world. It is characteristic that both Darimon and the patron who introduces his book – Émile Girardin,

[10] who complements his practical swindles with theoretical utopianism – do not find the antithesis of the monopoly banks of France and England in Scotland, but rather look for it in the United States, where the banking system, owing to the need to obtain a charter from the individual State, is only nominally free, where the prevailing system is not free competition among banks but a federation of monopoly banks. The Scottish banking and monetary system was indeed the most perilous reef for the illusions of the circulation artists. Gold or silver money (except where coins of both kinds are legal tender) are not said to depreciate no matter how often their value changes relative to other commodities. Why not? Because they form their own denomination; because their title is not a title to a value, i.e. they are not measured in a third commodity, but merely express fractional parts of their own substance, 1 sovereign = so much gold of a given weight. Gold is therefore nominally undepreciable, not because it alone expresses *an authentic value,* but because as money it does *not* express *value at all,* but merely expresses a given quantity of its own substance, merely carries its own quantitative definition on its forehead. (To be examined more closely later: whether this characteristic mark of gold and silver money is in the last analysis an intrinsic property of all money.) Deceived by this nominal undepreciability of metallic money, Darimon and consorts see only the one aspect which surfaces during crises: the appreciation of gold and silver in relation to nearly all other commodities; they do not see the other side, the *depreciation* of gold and silver or of *money* in relation to all other commodities (labour perhaps, not always, excluded) in periods of so-called *prosperity,* periods of a temporary general rise of prices. Since this depreciation of metallic money (and of all kinds of money which rest on it) always precedes its appreciation, they ought to have formulated the problem the other way round: how to prevent the periodic depreciation of money (in their language, to abolish the privileges of commodities in relation to money). In this last formulation the problem would have reduced itself to: how to overcome the rise and fall of prices. The way to do this: abolish prices. And how? By doing away with exchange value. But this problem arises: exchange corresponds to the bourgeois organization of society. Hence one last problem: to revolutionize bourgeois society economically. It would then have been self-evident from the outset that the evil of bourgeois

society is not to be remedied by ‘transforming’ the banks or by founding a rational ‘money system’.

Convertibility, therefore – legal or not – remains a requirement of every kind of money whose title makes it a value-symbol, i.e. which equates it as a quantity with a third commodity. The equation already includes the antithesis, the possibility of nonequivalence; convertibility includes its opposite, inconvertibility; appreciation includes depreciation, δυνάμει, [11] as Aristotle would say. Suppose for example that the sovereign were not only called a sovereign, which is a mere honorific for the *x*th fraction of an ounce of gold (accounting name), in the same way that a metre is the name for a certain length, but were called, say, *x hours of labour time.* 1/*x* ounce of gold is in fact nothing more than 1/*x* hours of labour time materialized, objectified. But gold is labour time accumulated in the past, labour time defined. Its title would make a given quantity of labour as such into its standard. The pound of gold would have to be convertible into *x* hours of labour time, would have to be able to purchase it at any given moment: as soon as it could buy a greater or a lesser amount, it would be appreciated or depreciated; in the latter case its convertibility would have ceased. What determines value is not the amount of labour time incorporated in products, but rather the amount of labour time necessary at a given moment. Take the pound of gold itself: let it be the product of 20 hours’ labour time. Suppose that for some reason it later requires only 10 hours to produce a pound of gold. The pound of gold whose title advises that it = 20 hours’ labour time would now merely = 10 hours’ labour time, since 20 hours’ labour time = 2 pounds of gold. 10 hours of labour are in practice exchanged for 1 pound of gold; hence 1 pound of gold cannot any longer be exchanged for 20 hours of labour time. Gold money with the plebeian title *x hours of labour* would be exposed to greater fluctuations than any other sort of money and particularly more than the present gold money, because gold cannot rise or fall in relation to gold (it is equal to itself), while the labour time accumulated in a given quantity of gold, in contrast, must constantly rise or fall in relation to present, living labour time. In order to maintain its convertibility, the productivity of labour time would have to be kept stationary. Moreover, in view of the general economic law that the costs of production constantly decline, that living labour becomes constantly more productive, hence that the labour time objectified in products constantly depreciates, the inevitable fate of this golden labour money would be constant depreciation. In order to control this evil, it might be said that the title of labour time should go not to gold but, as Weitling proposed, with Englishmen ahead of him and French after, Proudhon & Co. among them, to paper money, to a mere symbol of value. The labour time incorporated in the paper itself would then have as little relevance as the paper value of banknotes. The former would be merely the representation of hours of labour, as the latter is of gold or silver. If the hour of labour became more productive, then the chit of paper which represents it would rise in buying power, and vice versa, exactly as a £5 note at present buys more or less depending on whether the relative value of gold in comparison to other commodities rises or falls. According to the same law which would subject golden labour money to a constant depreciation, paper labour money would enjoy a constant appreciation. And that is precisely what we are after; the worker would reap the joys of the rising productivity of his labour, instead of creating proportionately more alien wealth and devaluing himself as at present. Thus the socialists. But, unfortunately, there arise some small scruples. First of all: if we once presuppose money, even if it is only time-chits, then we must also presuppose the accumulation of this money, as well as contracts, obligations, fixed burdens etc., which are entered into in the form of this money. The accumulated chits would constantly appreciate together with the newly issued ones, and thus on the one hand the rising productivity of labour would go to the benefit of non-workers, and on the other hand the previously contracted burdens would keep step with the rising yield of labour. The rise and fall in the value of gold or silver would be quite irrelevant if the world could be started afresh at each new moment and if, hence, previous obligations to pay a certain quantity of gold did not survive the fluctuations in the value of gold. The same holds, here, with the time-chit and hourly productivity.

The point to be examined here is the convertibility of the time-chit. We reach the same goal if we make a detour. Although it is still too early, a few observations can be made about the delusions on which the time-chit rests, which allow us an insight into the depths of the secret which links Proudhon’s theory of circulation with his general theory – his theory of the determination of value. We find the same link e.g. in Bray [12] and Gray. [13] Whatever basis in truth it may happen to have will be examined later [14] (but first, incidentally: seen only as drafts on gold, banknotes should not be issued in amounts exceeding the quantity of gold which they pretend to replace, or they depreciate. Three drafts of £15 which I issue to three different creditors on the same £15 in gold are in fact only drafts on £15 / 3 = £5 each. Each of these notes would have depreciated to 33 1/3 per cent from the outset.)

The *value* (the real exchange value) of all commodities (labour included) is determined by their cost of production, in other words by the labour time required to produce them. Their *price* is this exchange value of theirs, expressed in money. The replacement of metal money (and of paper or fiat money denominated in metal money) by labour money denominated in labour time would therefore equate the *real value* (exchange value) of commodities with their *nominal value, price, money value.* Equation of *real value and nominal value, of value and price.* But such is by no means the case. The value of commodities as determined by labour time is only their *average value.* This average appears as an external abstraction if it is calculated out as the average figure of an epoch, e.g. 1 lb. of coffee = 1s. if the average price of coffee is taken over 25 years; but it is very real if it is at the same time recognized as the driving force and the moving principle of the oscillations which commodity prices run through during a given epoch. This reality is not merely of theoretical importance: it forms the basis of mercantile speculation, whose calculus of probabilities depends both on the median price averages which figure as the centre of oscillation, and on the average peaks and average troughs of oscillation above or below this centre. The *market value* is always different, is always below or above this average value of a commodity. Market value equates itself with real value by means of its constant oscillations, never by means of an equation with real value as if the latter were a third party, but rather by means of constant non-equation of itself (as Hegel would say, not by way of abstract identity, but by constant negation of the negation, i.e. of itself as negation of real value). [15] In my pamphlet against Proudhon I showed that real value itself – independently of its rule over the oscillations of the market price (seen apart from its role as the *law* of these oscillations) – in turn negates itself and constantly posits the real value of commodities in contradiction with its own character, that it constantly depreciates or appreciates the real value of already produced commodities; this is not the place to discuss it in greater detail. [16] *Price* therefore is distinguished from *value* not only as the nominal from the real; not only by way of the denomination in gold and silver, but because the latter appears as the law of the motions which the former runs through. But the two are constantly different and never balance out, or balance only coincidentally and exceptionally. The price of a commodity constantly stands above or below the value of the commodity, and the value of the commodity itself exists only in this up-and-down movement of commodity prices. Supply and demand constantly determine the prices of commodities; never balance, or only coincidentally; but the cost of production, for its part, determines the oscillations of supply and demand. The gold or silver in which the price of a commodity, its market value, is expressed is itself a certain quantity of accumulated labour, a certain measure of materialized labour time. On the assumption that the production costs of a commodity and the production costs of gold and silver remain constant, the rise or fall of its market price means nothing more than that a commodity, $= x$ labour time, constantly commands $>$ or $< x$ labour time on the market, that it stands above or beneath its average value as determined by labour time. The first basic illusion of the time-chitters consists in this, that by annulling the *nominal difference* between real value and market value, between exchange value and price – that is, by expressing value in units of labour time itself instead of in a given objectification of labour time, say gold and silver – that in so doing they also remove the real difference and contradiction between price and value. Given this illusory assumption it is self-evident that the mere introduction of the time-chit does away with all crises, all faults of bourgeois production. The money price of commodities = their real value; demand = supply; production = consumption; money is simultaneously abolished and preserved; the labour time of which the commodity is the product, which is materialized in the commodity, would need only to be measured in order to create a corresponding mirror-image in the form of a value-symbol, money, time-chits. In this way every commodity would be directly transformed into money; and gold and silver, for their part, would be demoted to the rank of all other commodities.

It is not necessary to elaborate that the contradiction between exchange value and price – the average price and the prices of which it is the average –

that the difference between magnitudes and average magnitudes is not overcome merely by suppressing the *difference in name,* e.g. by saying, instead of: 1 lb. bread costs 8d., 1 lb. bread = 1/x hours of labour. Inversely, if 8d. = 1/x hours of labour, and if the labour time which is materialized in one pound of bread is greater or less than 1/x hours of labour, then, because the measure of value would be at the same time the element in which the price is expressed, the difference between price and value, which is hidden in the gold price or silver price, would never be glaringly visible. An infinite equation would result. 1/x hours of labour (as contained in 8d. or represented by a chit) > < than 1/x hours of labour (as contained in the pound of bread).

The time-chit, representing *average labour time,* would never correspond to or be convertible into *actual labour time;* i.e. the amount of labour time objectified in a commodity would never command a quantity of labour time equal to itself, and vice versa, but would command, rather, either more or less, just as at present every oscillation of market values expresses itself in a rise or fall of the gold or silver prices of commodities.

The constant depreciation of commodities – over longer periods – in relation to time-chits, which we mentioned earlier, arises out of the law of the rising productivity of labour time, out of the disturbances within relative value itself which are created by its own inherent principle, namely labour time. This inconvertibility of the time-chits which we are now discussing is nothing more than another expression for the inconvertibility between real value and market value, between exchange value and price. In contrast to all other commodities, the time-chit would represent an ideal labour time which would be exchanged sometimes against more and sometimes against less of the actual variety, and which would achieve a separate existence of its own in the time-chit, an existence corresponding to this non-equivalence. The general equivalent, medium of circulation and measure of commodities would again confront the commodities in an individual form, following its own laws, alienated, i.e. equipped with all the properties of money as it exists at present but unable to perform the same services. The medium with which commodities – these objectified quantities of labour time – are compared would not be a third commodity but would be rather their own measure of value, labour time itself; as a result, the confusion would reach a new height altogether. Commodity A, the objectification of 3 hours' labour time, is = 2 labour-hour-chits; commodity B, the objectification, similarly, of 3 hours' labour, is = 4 labour-hour-chits. This contradiction is in practice expressed in money prices, but in a veiled form. The difference between price and value, between the commodity measured by the labour time whose product it is, and the product of the labour time against which it is exchanged, this difference calls for a third commodity to act as a measure in which the real exchange value of commodities is expressed. *Because price is not equal to value, therefore the value-determining element – labour time – cannot be the element in which prices are expressed, because labour time would then have to express itself simultaneously as the determining and the non-determining element, as the equivalent and non-equivalent of itself.* Because labour time as the measure of value exists only as an ideal, it cannot serve as the matter of price-comparisons. (Here at the same time it becomes clear how and why the value relation obtains a separate material existence in the form of money. This to be developed further.) The difference between price and value calls for values to be measured as prices on a different standard from their own. Price as distinct from value is necessarily money price. It can here be seen that the nominal difference between price and value is conditioned by their real difference.

Commodity A = 1s. (i.e. = $1/x$ silver); commodity B = 2s. (i.e. $2/x$ silver). Hence commodity B = double the value of commodity A. The value relation between A and B is expressed by means of the proportion in which they are exchanged for a quantity of a third commodity, namely silver; they are not exchanged for a value-relation.

Every commodity (product or instrument of production) is = the objectification of a given amount of labour time. Their value, the relation in which they are exchanged against other commodities, or other commodities against them, is = to the quantity of labour time realized in them. If a commodity e.g. = 1 hour of labour time, then it exchanges with all other commodities which are the product of 1 hour of labour time. (This whole reasoning on the presupposition that exchange value = market value; real value = price.) The value of the commodity is different from the commodity itself. The commodity is a value (exchange value) only within exchange (real or imagined); value is not only the exchangeability of the commodity in general, but its specific exchangeability. Value is at the same time the exponent of the relation in which the commodity is exchanged with other commodities, as well as the exponent of the relation in which it has already been exchanged with other commodities (materialized labour time) in production; it is their quantitatively determined exchangeability. Two commodities, e.g. a yard of cotton and a measure of oil, considered as cotton and as oil, are different by nature, have different properties, are measured by different measures, are incommensurable. Considered as values, all commodities are qualitatively equal and differ only quantitatively, hence can be measured against each other and substituted for one another (are mutually exchangeable, mutually convertible) in certain quantitative relations. Value is their social relation, their economic quality. A book which possesses a certain value and a loaf of bread possessing the same value are exchanged for one another, are the same value but in a different material. As a value, a commodity is an equivalent for all other commodities in a given relation. As a value, the commodity is an equivalent; as an equivalent, all its natural properties are extinguished; it no longer takes up a special, qualitative relationship towards the other commodities; but is rather the general measure as well as the general representative, the general medium of exchange of all other commodities. As value, it is *money.* But because the commodity, or rather the product or the instrument of production, is different from its value, its existence as value is different from its existence as product. Its property of being a value not only can but must achieve an existence different from its natural one. Why? Because commodities as values are different from one another only quantitatively; therefore each commodity must be qualitatively different from its own value. Its value must therefore have an existence which is qualitatively distinguishable from it, and in actual exchange this separability must become a real separation, because the natural distinctness of commodities must come into contradiction with their economic equivalence, and because both can exist together only if the commodity achieves a double existence, not only a natural but also a purely economic existence, in which latter it is a mere symbol, a cipher for a relation of production, a mere symbol for its own value. As a value, every commodity is equally divisible; in its natural existence this is not the case. As a value it remains the same no matter how many metamorphoses and forms of existence it goes through; in reality, commodities are exchanged only because they are not the same and correspond to different systems of needs. As a value, the commodity is general; as a real commodity it is particular. As a value it is always exchangeable; in real exchange it is exchangeable only if it fulfills particular conditions. As a value, the measure of its exchangeability is determined by itself; exchange value expresses precisely the relation in which it replaces other commodities; in real exchange it is exchangeable only in quantities which are linked with its natural properties and which correspond to the needs of the participants in exchange. (In short, all properties which may be cited as the special qualities of money are properties of the commodity as exchange value, of the product as value as distinct from the value as product.) (The exchange value of a commodity, as a separate form of existence accompanying the commodity itself, is *money*; the form in which all commodities equate, compare, measure themselves; into which all commodities dissolve themselves; that which dissolves itself into all commodities; the universal equivalent.) Every moment, in calculating, accounting etc., that we transform commodities into value symbols, we fix them as mere exchange values, making abstraction from the matter they are composed of and all their natural qualities. On paper, in the head, this metamorphosis proceeds by means of mere abstraction; but in the real exchange process a real *mediation* is required, a means to accomplish this abstraction. In its natural existence, with its natural properties, in natural identity with itself, the commodity is neither constantly exchangeable nor exchangeable against *every other commodity;* this it is only as something different from itself, something distinct from itself, as exchange value. We must first transpose the commodity into itself as exchange value in order then to be able to compare this exchange value with other exchange values and to exchange it. In the crudest barter, when two commodities are exchanged for one another, each is first equated with a symbol which expresses their exchange value, e.g. among certain Negroes on the West African coast, = *x* bars. One commodity is = 1 bar; the other = 2 bars. They are exchanged in this relation. The commodities are first transformed into bars in the head and in speech before they are exchanged for one another. They are appraised before being exchanged, and in order to appraise them they must be brought into a given numerical relation to one another. In order to bring them into such a numerical relation, in order to make them commensurable, they must obtain the same denomination (unit). (The bar has a merely imaginary existence, just as, in general, a relation can obtain a particular embodiment and become individualized only by means of abstraction.) In order to cover the excess of one value over another in exchange, in order to liquidate the balance, the crudest barter, just as with international trade today, requires payment in money.

Products (or activities) are exchanged only as commodities; commodities in exchange exist only as values; only as values are they comparable. In order to determine what amount of bread I need in order to exchange it for a yard of linen, I first equate the yard of linen with its exchange value, i.e. = $1/x$ hours of labour time. Similarly, I equate the pound of bread with its exchange value, = $1/x$ or $2/x$ hours of labour time. I equate each of the commodities with a third; i.e. not with themselves. This third, which differs from them both, exists initially only in the head, as a conception, since it expresses a relation; just as, in general, relations can be established as existing only by being *thought,* as distinct from the subjects which are in these relations with each other. In becoming an exchange value, a product (or activity) is not only transformed into a definite quantitative relation, a relative number – that is, a number which expresses the quantity of other commodities which equal it, which are its equivalent, or the relation in which it is their equivalent – but it must also at the same time be transformed qualitatively, be transposed into another element, so that both commodities become magnitudes of the same kind, of the same unit, i.e. commensurable. The commodity first has to be transposed into labour time, into something qualitatively different from itself (qualitatively different (1) because it is not labour time as labour time, but materialized labour time; labour time not in the form of motion, but at rest; not in the form of the process, but of the result; (2) because it is not the objectification of labour time in general, which exists only as a conception (it is only a conception of labour separated from its quality, subject merely to quantitative variations), but rather the specific result of a specific, of a naturally specified, kind of labour which differs qualitatively from other kinds), in order then to be compared as a specific amount of labour time, as a certain magnitude of labour, with other amounts of labour time, other magnitudes of labour. For the purpose of merely making a comparison – an appraisal of products – of determining their value ideally, it suffices to make this transformation in the head (a transformation in which the product exists merely as the expression of quantitative relations of production). This abstraction will do for comparing commodities; but in actual exchange this abstraction in turn must be objectified, must be symbolized, realized in a symbol. This necessity enters into force for the following reasons: (1) As we have already said, both the commodities to be exchanged are transformed in the head into common relations of magnitude, into exchange values, and are thus reciprocally compared. But if they are then to be exchanged in reality, their natural properties enter into contradiction with their character as exchange values and as mere denominated numbers. They are not divisible at will etc. (2) In the real exchange process, particular commodities are always exchanged against particular commodities, and the exchangeability of commodities, as well as the relation in which they are exchangeable, depends on conditions of place and time, etc. But the transformation of the commodity into exchange value does not equate it to any other particular commodity, but expresses it as equivalent, expresses its exchangeability relation, *vis-à-vis* all other commodities. This comparison, which the head accomplishes in one stroke, can be achieved in reality only in a delimited sphere determined by needs, and only in successive steps. (For example, I exchange an income of 100 thalers as my needs would have it one after another against a whole range of commodities whose sum = the exchange value of 100 thalers.) Thus, in order to realize the commodity as exchange value in one stroke, and in order to give it the general influence of an exchange value, it is not enough to exchange it for one particular commodity. It must be exchanged against a third thing which is not in turn itself a particular commodity, but is the symbol of the commodity as commodity, of the commodity's exchange value itself; *which thus represents, say, labour time as such,* say a piece of paper or of leather, which represents a fractional part of labour time. (Such a symbol presupposes general recognition; it can only be a social symbol; it expresses, indeed, nothing more than a social relation.) This symbol represents the fractional parts of labour time; it represents exchange value in such fractional parts as are capable of expressing all relations between exchange values by means of simple arithmetical combination; this symbol, this material sign of exchange value, is a product of exchange itself, and not the execution of an idea conceived *a priori.* (In fact the commodity which is required as medium of exchange becomes transformed into money, into a symbol, only little by little; as soon as this has happened, it can in turn be replaced by a symbol of itself. It then becomes the conscious sign of exchange value.)

The process, then, is simply this: The product becomes a commodity, *i.e. a mere moment of exchange.* The commodity is transformed into exchange value. In order to equate it with itself as an exchange value, it is exchanged for a symbol which represents it as exchange value as such. As such a symbolized exchange value, it can then in turn be exchanged in definite relations for every other commodity. Because the product becomes a commodity, and the commodity becomes an exchange value, it obtains, at first only in the head, a double existence. This doubling in the idea proceeds (and must proceed) to the point where the commodity appears double in real exchange: as a natural product on one side, as exchange value on the other. I.e. the commodity's exchange value obtains a material existence separate from the commodity.

The definition of a product as exchange value thus necessarily implies that exchange value obtains a separate existence, in isolation from the product. The exchange value which is separated from commodities and exists alongside them as itself a commodity, this is – *money.* In the form of *money* all properties of the commodity as exchange value appear as an object distinct from it, as a form of social existence separated from the natural existence of the commodity. (This to be further shown by enumerating the usual properties of money.) (The material in which this symbol is expressed is by no means a matter of indifference, even though it manifests itself in many different historical forms. In the development of society, not only the symbol but likewise the material corresponding to the symbol are worked out – a material from which society later tries to disentangle itself; if a symbol is not to be arbitrary, certain conditions are demanded of the material in which it is represented. The symbols for words, for example the alphabet etc., have an analogous history.) Thus, the exchange value of a product creates money alongside the product. Now, just as it is impossible to suspend the complications and contradictions which arise from the existence of money alongside the particular commodities merely by altering the form of money (although difficulties characteristic of a lower form of money may be avoided by moving to a higher form), so also is it impossible to abolish money itself as long as exchange value remains the social form of products. It is necessary to see this clearly in order to avoid setting impossible tasks, and in order to know the limits within which monetary reforms and transformations of circulation are able to give a new shape to the relations of production and to the social relations which rest on the latter.

The properties of money as (1) measure of commodity exchange; (2) medium of exchange; (3) representative of commodities (hence object of contracts); (4) general commodity alongside the particular commodities, all simply follow from its character as exchange value separated from commodities themselves and objectified. (By virtue of its property as the general commodity in relation to all others, as the embodiment of the exchange value of the other commodities, money at the same time becomes the realized and always realizable form of capital; the form of capital's appearance which is always valid – a property which emerges in bullion drains; hence capital appears in history initially only in the money form; this explains, finally, the link between money and the rate of interest, and its influence on the latter.)

To the degree that production is shaped in such a way that every producer becomes dependent on the exchange value of his commodity, i.e. as the product increasingly becomes an exchange value in reality, and exchange value becomes the immediate object of production – to the same degree must *money relations* develop, together with the contradictions immanent in the *money relation,* in the relation of the product to itself as money. The need for exchange and for the transformation of the product into a pure exchange value progresses in step with the division of labour, i.e. with the increasingly social character of production. But as the latter grows, so grows the power of *money,* i.e. the exchange relation establishes itself as a power external to and independent of the producers. What originally appeared as a means to promote production becomes a relation alien to the producers. As the producers become more dependent on exchange, exchange appears to become more independent of them, and the gap between the product as product and the product as exchange value appears to widen. Money does not create these antitheses and contradictions; it is, rather, the development of these contradictions and antitheses which creates the seemingly transcendental power of money. (To be further developed, the influence of the transformation of all relations into money relations: taxes in kind into money taxes, rent in kind into money rent, military service into mercenary troops, all personal services in general into money services, of patriarchal, slave, serf and guild labour into pure wage labour.)

The product becomes a commodity; the commodity becomes exchange value; the exchange value of the commodity is its immanent money-property; this, its money-property, separates itself from it in the form of money, and achieves a general social existence separated from all particular commodities and their natural mode of existence; the relation of the product to itself as exchange value becomes its relation to money, existing alongside it; or, becomes the relation of all products to money, external to them all. Just as the real exchange of products creates their exchange value, so does their exchange value create money.

The next question to confront us is this: are there not contradictions, inherent in this relation itself, which are wrapped up in the existence of money alongside commodities?

Firstly: The simple fact that the commodity exists doubly, in one aspect as a specific product whose natural form of existence ideally contains (latently contains) its exchange value, and in the other aspect as manifest exchange value (money), in which all connection with the natural form of the product is stripped away again – this double, *differentiated* existence must develop into a *difference*, and the difference into *antithesis* and *contradiction.* The same contradiction between the particular nature of the commodity as product and its general nature as exchange value, which created the necessity of positing it doubly, as this particular commodity on one side and as money on the other – this contradiction between the commodity's particular natural qualities and its general social qualities contains from the beginning the possibility that these two separated forms in which the commodity exists are not convertible into one another. The exchangeability of the commodity exists as a thing beside it, as money, as something different from the commodity, something no longer directly identical with it. As soon as money has become an external thing alongside the commodity, the exchangeability of the commodity for money becomes bound up with external conditions which may or may not be present; it is abandoned to the mercy of external conditions. The commodity is demanded in exchange because of its natural properties, because of the needs for which it is the desired object. Money, by contrast, is demanded only because of its exchange value, as exchange value. Hence, whether or not the commodity is transposable into money, whether or not it can be exchanged for money, whether its exchange value can be posited for it – this depends on circumstances which initially have nothing to do with it as exchange value and are independent of that. The transposability of the commodity depends on the natural properties of the product; that of money coincides with its existence as symbolized exchange value. There thus arises the possibility that the commodity, in its specific form as product, can no longer be exchanged for, equated with, its general form as money.

By existing outside the commodity as money, the exchangeability of the commodity has become something different from and alien to the commodity, with which it first has to be brought into equation, to which it is therefore at the beginning unequal; while the equation itself becomes dependent on external conditions, hence a matter of chance.

Secondly: Just as the exchange value of the commodity leads a double existence, as the particular commodity and as money, so does the act of exchange split into two mutually independent acts: exchange of commodities for money, exchange of money for commodities; purchase and sale. Since these have now achieved a spatially and temporally separate and mutually indifferent form of existence, their immediate identity ceases. They may correspond or not; they may balance or not; they may enter into disproportion with one another. They will of course always attempt to equalize one another; but in the place of the earlier immediate equality there now stands the constant movement of equalization, which evidently presupposes constant non-equivalence. It is now entirely possible that consonance may be reached only by passing through the most extreme dissonance.

Thirdly: With the separation of purchase and sale, with the splitting of exchange into two spatially and temporally independent acts, there further emerges another, new relation.

Just as exchange itself splits apart into two mutually independent acts, so does the overall movement of exchange itself become separate from the exchangers, the producers of commodities. Exchange for the sake of exchange separates off from exchange for the sake of commodities. A mercantile estate [17] steps between the producers; an estate which only buys in order to sell and only sells so as to buy again, and whose aim in this operation is not the possession of commodities as products but merely the obtaining of exchange values as such, of money. (A mercantile estate can take shape even with mere barter. But since only the overflow of production on both sides is at its disposal, its influence on production, and its importance as a whole, remain completely secondary.) The rise of exchange (commerce) as an independent function torn away from the exchangers corresponds to the rise of exchange value as an independent entity, as money, torn away from products. Exchange value was the measure of commodity exchange; but its aim was the direct possession of the exchanged commodity, its consumption (regardless of whether this consumption consists of serving to satisfy needs directly, i.e. serving as product, or of serving in turn as a tool of production). The purpose of commerce is not consumption, directly, but the gaining of money, of exchange values. This doubling of exchange – exchange for the sake of consumption and exchange for exchange – gives rise to a new disproportion. In his exchange, the merchant is guided merely by the difference between the purchase and sale of commodities; but the consumer who buys a commodity must replace its exchange value once and for all. Circulation, i.e. exchange within the mercantile estate, and the point at which circulation ends, i.e. exchange between the mercantile estate and the consumers – as much as they must ultimately condition one another – are determined by quite different laws and motives, and can enter into the most acute contradiction with one another. The possibility of commercial crises is already contained in this separation. But since production works directly for commerce and only indirectly for consumption, it must not only create but also and equally be seized by this incongruency between commerce and exchange for consumption. (The relations of demand and supply become entirely inverted.) (The money business then in turn separates from commerce proper.)

Aphorisms. (All commodities are perishable money; money is the imperishable commodity. With the development of the division of labour, the immediate product ceases to be a medium of exchange. The need arises for a general medium of exchange, i.e. a medium of exchange independent of the specific production of each individual. Money implies the separation between the value of things and their substance. Money is originally the representative of all values; in practice this situation is inverted, and all real products and labours become the representatives of money. In direct barter, every article cannot be exchanged for every other; a specific activity can be exchanged only for certain specific products. Money can overcome the difficulties inherent in barter only by generalizing them, making them universal. It is absolutely necessary that forcibly separated elements which essentially belong together manifest themselves by way of forcible eruption as the *separation* of things which belong together in essence. The unity is brought about *by force.* As soon as the antagonistic split leads to eruptions, the economists point to the *essential unity* and abstract from the alienation. Their apologetic wisdom consists in forgetting their own definitions at every decisive moment. The product as direct medium of exchange is (1) still directly bound to its natural quality, hence limited in every way by the latter; it can, for example, deteriorate etc.; (2) connected with the immediate need which another may have or not have at the time, or which he may have for his own product. When the product becomes subordinated to labour and labour to exchange, then a moment enters in which both are separated from their owner. Whether, after this separation, they return to him again in another shape becomes a matter of *chance*. When money enters into exchange, I am forced to exchange my product for exchange value in general or for the general capacity to exchange, hence my product becomes dependent on the state of general commerce and is torn out of its local, natural and individual boundaries. For exactly that reason it can cease to be a product.)

Fourthly: Just as exchange value, in the form of money, takes its place as the *general commodity* alongside all particular commodities, so does exchange value as money therefore at the same time take its place as a *particular commodity* (since it has a particular existence) alongside all other commodities. An incongruency arises not only because money, which exists only in exchange, confronts the particular exchangeability of commodities as their general exchangeability, and directly extinguishes it, while, nevertheless, the two are supposed to be always convertible into one another; but also because money comes into contradiction with itself and with its characteristic by virtue of being itself a *particular* commodity (even if only a symbol) and of being subject, therefore, to particular conditions of exchange in its exchange with other commodities, conditions which contradict its general unconditional exchangeability. (Not to speak of money as fixed in the substance of a particular product, etc.) Besides its existence in the commodity, exchange value achieved an existence of its own in money, was separated from its substance exactly because the natural characteristic of this substance contradicted its general characteristic as exchange value. Every commodity is equal (and comparable) to every other as exchange value (*qualitatively*: each now merely represents a *quantitative* plus or minus of exchange value). For that reason, this equality, this unity of the commodity is distinct from its natural differentiation; and appears in money therefore as their common element as well as a third thing which confronts them both. But on one side, exchange value naturally remains at the same time an inherent quality of commodities while it simultaneously exists outside them; on the other side, when money no longer exists as a property of commodities, as a common element within them, but as an individual entity apart from them, then money itself becomes a *particular* commodity alongside the other commodities. (Determinable by demand and supply; splits into different kinds of money, etc.) It becomes a commodity like other commodities, and at the same time it is not a commodity like other commodities. Despite its general character it is one exchangeable entity among other exchangeable entities. It is not only the general exchange value, but at the same time a particular exchange value alongside other particular exchange values. Here a new source of contradictions which make themselves felt in practice. (The particular nature of money emerges again in the separation of the money business from commerce proper.)

We see, then, how it is an inherent property of money to fulfil its purposes by simultaneously negating them; to achieve independence from commodities; to be a means which becomes an end; to realize the exchange value of commodities by separating them from it; to facilitate exchange by splitting it; to overcome the difficulties of the direct exchange of commodities by generalizing them; to make exchange independent of the producers in the same measure as the producers become dependent on exchange.

(It will be necessary later, before this question is dropped, to correct the idealist manner of the presentation, which makes it seem as if it were merely a matter of conceptual determinations and of the dialectic of these concepts. Above all in the case of the phrase: product (or activity) becomes commodity; commodity, exchange value; exchange value, money.)

(*Economist.* 24 January 1857. The following passage to be borne in mind on the subject of banks:

‘So far as the mercantile classes share, which they now do very generally, in the profits of banks – and may to a still greater extent by the wider diffusion of joint-stock banks, the abolition of all corporate privileges, and the extension of perfect freedom to the business of banking – they have been enriched by the increased rates of money. In truth, the mercantile classes by the extent of their deposits, are virtually their own bankers; and so far as that is the case, the rate of discount must be to them of little importance. All banking and other reserves must of course be the results of continual industry, and of savings laid by out of profits; and consequently, taking the mercantile and industrious classes as a whole, they must be their own bankers, and it requires only that the principles of free trade should be extended to all businesses, to equalize or naturalize for them the advantages and disadvantages of all the fluctuations in the money market.’)

All contradictions of the *monetary system* and of the exchange of products under the monetary system are the development of the relation of products as *exchange values,* of their definition as *exchange value* or as *value* pure and simple.

(*Morning Star.* 12 February 1857. ‘The pressure of money during last year, and the high rate of discount which was adopted in consequence, has been very beneficial to the profit account of the Bank of France. Its dividend has gone on increasing: 118 fr. in 1852, 154 fr. in 1853, 194 fr. in 1854, 200 fr. in 1855, 272 fr. in 1856.')

Also to be noted, the following passage: The English silver coins issued at a price higher than the value of the silver they contain. A pound silver of an intrinsic value of 60–62s. (£3 on an average in gold) was coined into 66s. The Mint pays the 'market price of the day, from 5s. to 5s. 2d. the ounce, and issues at the rate of 5s. 6d. the ounce. There are two reasons which prevent any practical inconvenience resulting from this arrangement:' (*of silver tokens*, not of intrinsic value) 'first, the coin can only be procured at the Mint, and at that price; as home circulation, then, it cannot be depreciated, and it cannot be sent abroad because it circulates here for more than its intrinsic value; and secondly, as it is a legal tender only up to 40s., it never interferes with the gold coins, nor affects their value.' Gives France the advice to do the same: to issue subordinate coins of silver tokens, not of intrinsic value, and limit[ing] the amount to which they should be a legal tender. But at the same time: in fixing the quality of the coin, to take a larger margin between the intrinsic and the nominal value than we have in England, because the increasing value of silver in relation to gold may very probably, before long, rise up to our present Mint price, when we may be obliged again to alter it. Our silver coin is now little more than 5% below the intrinsic value: a short time since it was 10%. (*Economist*. 24 January 1857.)

Now, it might be thought that the issue of time-chits overcomes all these difficulties. (The existence of the time-chit naturally already presupposes conditions which are not directly given in the examination of the relations of exchange value and money, and which can and do exist without the time-chit: public credit, bank etc.; but all this not to be touched on further here, since the time-chit men of course regard it as the ultimate product of the 'series', which, even if it corresponds most to the 'pure' concept of money, 'appears' last in reality.) To begin with: If the preconditions under which the price of commodities = their exchange value are fulfilled and given; balance of demand and supply; balance of production and consumption; and what this amounts to in the last analysis, *proportionate production* (the so-called relations of distribution are themselves relations of production), then the money question becomes entirely secondary, in particular the question whether the tickets should be blue or green, paper or tin, or whatever other form social accounting should take. In that case it is totally meaningless to keep up the pretence that an investigation is being made of the real relations of money.

The bank (any bank) issues the time-chits. [18] A commodity, A = the exchange value x, i.e. = x hours of labour time, is exchanged for a quantity of money representing x labour time. The bank would at the same time have to purchase the commodity, i.e. exchange it for its representative in monetary form, just as e.g. the Bank of England today has to give notes for gold. The commodity, the substantial and therefore accidental existence of exchange value, is exchanged for the symbolic existence of exchange value as exchange value. There is then no difficulty in transposing it from the form of the commodity into the form of money. The labour time contained in it only needs to be authentically verified (which, by the way, is not as easy as assaying the purity and weight of gold and silver) and thereby immediately creates its *counter-value*, its monetary existence. No matter how we may turn and twist the matter, in the last instance it amounts to this: the bank which issues the time-chits buys commodities at their costs of production, buys all commodities, and moreover this purchase costs the bank nothing more than the production of snippets of paper, and the bank gives the seller, in place of the exchange value which he possesses in a definite and substantial form, the symbolic exchange value of the commodity, in other words a draft on all other commodities to the amount of the same exchange value. Exchange value as such can of course exist only symbolically, although in order for it to be employed as a thing and not merely as a formal notion, this symbol must possess an objective existence; it is not merely an ideal notion, but is actually presented to the mind in an objective mode. (A measure can be held in the hand; exchange value measures, but it exchanges only when the measure passes from one hand to the other.) So the bank gives money for the commodity; money which is an exact draft on the exchange value of the commodity, i.e. of all commodities of the same value; the bank buys. The bank is the general buyer, the buyer of not only this or that commodity, but all commodities. For its purpose is to bring about the transposition of every commodity into its symbolic existence as exchange value. But if it is the general buyer, then it also has to be the general seller; not only the dock where all wares are deposited, not only the general warehouse, but also the owner of the commodities, in the same sense as every merchant. I have exchanged my commodity A for the time-chit B, which represents the commodity's exchange value; but I have done this only so that I can then further metamorphose this B into any real commodity C, D, E etc., as it suits me. Now, can this money circulate outside the bank? Can it take any other route than that between the owner of the chit and the bank? How is the convertibility of this chit secured? Only two cases are possible. Either all owners of commodities (be these products or labour) desire to sell their commodities at their exchange value, or some want to and some do not. If they all want to sell at their exchange value, then they will not await the chance arrival or non-arrival of a buyer, but go immediately to the bank, unload their commodities on to it, and obtain their exchange value symbol, money, for them: they redeem them for its money. In this case the bank is simultaneously the general buyer and the general seller in one person. Or the opposite takes place. In this case, the bank chit is mere paper which claims to be the generally recognized symbol of exchange value, but has in fact no value. For this symbol has to have the property of not merely representing, but *being,* exchange value in actual exchange. In the latter case the bank chit would not be money, or it would be money only by convention between the bank and its clients, but not on the open market. It would be the same as a meal ticket good for a dozen meals which I obtain from a restaurant, or a theatre pass good for a dozen evenings, both of which represent money, but only in this particular restaurant or this particular theatre. The bank chit would have ceased to meet the qualifications of money, since it would not circulate among the general public, but only between the bank and its clients. We thus have to drop the latter supposition.

The bank would thus be the general buyer and seller. Instead of notes it could also issue cheques, and instead of that it could also keep simple bank accounts. Depending on the sum of commodity values which X had deposited with the bank, X would have that sum in the form of other commodities to his credit. A second attribute of the bank would be necessary: it would need the power to establish the exchange value of all commodities, i.e. the labour time materialized in them, in an authentic manner. But its functions could not end there. It would have to determine the labour time in which commodities could be produced, with the average means of production available in a given industry, i.e. the time in which they would have to be produced. But that also would not be sufficient. It would not only have to determine the time in which a certain quantity of products had to be produced, and place the producers in conditions which made their labour equally productive (i.e. it would have to balance and to arrange the distribution of the means of labour), but it would also have to determine the amounts of labour time to be employed in the different branches of production. The latter would be necessary because, in order to realize exchange value and make the bank's currency really convertible, social production in general would have to be stabilized and arranged so that the needs of the partners in exchange were always satisfied. Nor is this all. The biggest exchange process is not that between commodities, but that between commodities and labour. (More on this presently.) The workers would not be selling their labour to the bank, but they would receive the exchange value for the entire product of their labour, etc. Precisely seen, then, the bank would be not only the general buyer and seller, but also the general producer. In fact either it would be a despotic ruler of production and trustee of distribution, or it would indeed be nothing more than a board which keeps the books and accounts for a society producing in common. The common ownership of the means of production is presupposed, etc., etc. The Saint-Simonians made their bank into the papacy of production.

The dissolution of all products and activities into exchange values presupposes the dissolution of all fixed personal (historic) relations of dependence in production, as well as the all-sided dependence of the producers on one another. Each individual's production is dependent on the production of all others; and the transformation of his product into the necessaries of his own life is [similarly] dependent on the consumption of all others. Prices are old; exchange also; but the increasing determination of the former by costs of production, as well as the increasing dominance of the latter over all relations of production, only develop fully, and continue to develop ever more completely, in bourgeois society, the society of free competition. What Adam Smith, in the true eighteenth-century manner, puts in the prehistoric period, the period preceding history, is rather a product of history.

This reciprocal dependence is expressed in the constant necessity for exchange, and in exchange value as the all-sided mediation. The economists express this as follows: Each pursues his private interest and only his private interest; and thereby serves the private interests of all, the general interest, without willing or knowing it. The real point is not that each individual's pursuit of his private interest promotes the totality of private interests, the general interest. One could just as well deduce from this abstract phrase that each individual reciprocally blocks the assertion of the others' interests, so that, instead of a general affirmation, this war of all against all produces a general negation. The point is rather that private interest is itself already a socially determined interest, which can be achieved only within the conditions laid down by society and with the means provided by society; hence it is bound to the reproduction of these conditions and means. It is the interest of private persons; but its content, as well as the form and means of its realization, is given by social conditions independent of all.

The reciprocal and all-sided dependence of individuals who are indifferent to one another forms their social connection. This social bond is expressed in *exchange value*, by means of which alone each individual's own activity or his product becomes an activity and a product for him; he must produce a general product – *exchange value*, or, the latter isolated for itself and individualized, *money.* On the other side, the power which each individual exercises over the activity of others or over social wealth exists in him as the owner of *exchange values*, of *money*. The individual carries his social power, as well as his bond with society, in his pocket. Activity, regardless of its individual manifestation, and the product of activity, regardless of its particular make-up, are always *exchange value*, and exchange value is a generality, in which all individuality and peculiarity are negated and extinguished. This indeed is a condition very different from that in which the individual or the individual member of a family or clan (later, community) directly and naturally reproduces himself, or in which his productive activity and his share in production are bound to a specific form of labour and of product, which determine his relation to others in just that specific way.

The social character of activity, as well as the social form of the product, and the share of individuals in production here appear as something alien and objective, confronting the individuals, not as their relation to one another, but as their subordination to relations which subsist independently of them and which arise out of collisions between mutually indifferent individuals. The general exchange of activities and products, which has become a vital condition for each individual – their mutual interconnection – here appears as something alien to them, autonomous, as a thing. In exchange value, the social connection between persons is transformed into a social relation between things; personal capacity into objective wealth. The less social power the medium of exchange possesses (and at this stage it is still closely bound to the nature of the direct product of labour and the direct needs of the partners in exchange) the greater must be the power of the community which binds the individuals together, the patriarchal relation, the community of antiquity, feudalism and the guild system. (See my Notebook XII, 34 B.) [19] Each individual possesses social power in the form of a thing. Rob the thing of this social power and you must give it to persons to exercise over persons. Relations of personal dependence (entirely spontaneous at the outset) are the first social forms, in which human productive capacity develops only to a slight extent and at isolated points. Personal independence founded on *objective [sachlicher]* dependence is the second great form, in which a system of general social metabolism, of universal relations, of all-round needs and universal capacities is formed for the first time. Free individuality, based on the universal development of individuals and on their subordination of their communal, social productivity as their social wealth, is the third stage. The second stage creates the conditions for the third. Patriarchal as well as ancient conditions (feudal, also) thus disintegrate with the development of commerce, of luxury, of *money*, of *exchange value,* while modern society arises and grows in the same measure.

Exchange and division of labour reciprocally condition one another. Since everyone works for himself but his product is nothing for him, each must of course exchange, not only in order to take part in the general productive capacity but also in order to transform his own product into his own subsistence. (See my ‘Remarks on Economics’, p. V (13,20).) [20] Exchange, when mediated by exchange value and money, presupposes the all-round dependence of the producers on one another, together with the total isolation of their private interests from one another, as well as a division of social labour whose unity and mutual complementarity exist in the form of a natural relation, as it were, external to the individuals and independent of them. The pressure of general demand and supply on one another mediates the connection of mutually indifferent persons.

The very necessity of first transforming individual products or activities into *exchange value,* into *money,* so that they obtain and demonstrate their social *power* in this *objective [sachlichen]* form, proves two things: (1) That individuals now produce only for society and in society; (2) that production is not *directly* social, is not 'the offspring of association', which distributes labour internally. Individuals are subsumed under social production; social production exists outside them as their fate; but social production is not subsumed under individuals, manageable by them as their common wealth. There can therefore be nothing more erroneous and absurd than to postulate the control by the united individuals of their total production, on the basis of *exchange value*, of *money,* as was done above in the case of the time-chit bank. The *private exchange* of all products of labour, all activities and all wealth stands in antithesis not only to a distribution based on a natural or political super- and subordination of individuals to one another (to which *exchange* proper only runs parallel or, by and large, does not so much take a grip on the life of entire communities as, rather, insert itself between different communities; it by no means exercises general domination over all relations of production and distribution) (regardless of the character of this super- and subordination: patriarchal, ancient or feudal) but also to free exchange among individuals who are associated on the basis of common appropriation and control of the means of production. (The latter form of association is not arbitrary; it presupposes the development of material and cultural conditions which are not to be examined any further at this point.) Just as the division of labour creates agglomeration, combination, cooperation, the antithesis of private interests, class interests, competition, concentration of capital, monopoly, stock companies – so many antithetical forms of the unity which itself brings the antithesis to the fore – so does private exchange create world trade, private independence creates complete dependence on the so-called world market, and the fragmented acts of exchange create a banking and credit system whose books, at least keep a record of the balance between debit and credit in private exchange. Although the private interests within each nation divide it into as many nations as it has ‘full-grown individuals’, and although the interests of exporters and of importers are antithetical here, etc, etc., national trade does obtain the *semblance* of existence in the form of the rate of exchange. Nobody will take this as a ground for believing that a *reform of the money market* can abolish the *foundations* of internal or external private trade. But within bourgeois society, the society that rests on *exchange value,* there arise relations of circulation as well as of production which are so many mines to explode it. (A mass of antithetical forms of the social unity, whose antithetical character can never be abolished through quiet metamorphosis. On the other hand, if we did not find concealed in society as it is the material conditions of production and the corresponding relations of exchange prerequisite for a classless society, then all attempts to explode it would be quixotic.)

We have seen that, although exchange value is = to the relative labour time materialized in products, money, for its part, is = to the exchange value of commodities, separated from their substance; and that in this exchange value or money relation are contained the contradictions between commodities and their exchange value, between commodities as exchange values and money. We saw that a bank which directly creates the mirror image of the commodity in the form of labour-money is a utopia. Thus, although money owes its existence only to the tendency of exchange value to separate itself from the substance of commodities and to take on a pure form, nevertheless commodities cannot be directly transformed into money; i.e. the authentic certificate of the amount of labour time realized in the commodity cannot serve the commodity as its price in the world of exchange values. How is this?

(In one of the forms of money – in so far as it is *medium* of exchange (not *measure* of exchange value) – it is clear to the economists that the existence of money presupposes the objectification [*Versachlichung*] of the social bond; in so far, that is, as money appears in the form of *collateral* which one individual must leave with another in order to obtain a commodity from him. Here the economists themselves say that people place in a thing (money) the faith which they do not place in each other. But why do they have faith in the thing? Obviously only because that thing is an *objectified relation* between persons; because it is objectified exchange value, and exchange value is nothing more than a mutual relation between people's productive activities. Every other collateral may serve the holder directly in that function: money serves him only as the 'dead pledge of society', [21] but it serves as such only because of its social (symbolic) property; and it can have a social property only because individuals have alienated their own social relationship from themselves so that it takes the form of a thing.)

In the *lists of current prices,* where all values are measured in money, it seems as though this independence from persons of the social character of things is, by the activity of commerce, on this basis of alienation where the relations of production and distribution stand opposed to the individual, to all individuals, at the same time subordinated to the individual again. Since, 'if you please', the autonomization of the world market (in which the activity of each individual is included), increases with the development of monetary relations (exchange value) and vice versa, since the general bond and all-round interdependence in production and consumption increase together with the independence and indifference of the consumers and producers to one another; since this contradiction leads to crises, etc., hence, together with the development of this alienation, and on the same basis, efforts are made to overcome it: institutions emerge whereby each individual can acquire information about the activity of all others and attempt to adjust his own accordingly, e.g. lists of current prices, rates of exchange, interconnections between those active in commerce through the mails, telegraphs etc. (the means of communication of course grow at the same time). (This means that, although the total supply and demand are independent of the actions of each individual, everyone attempts to inform himself about them, and this knowledge then reacts back in practice on the total supply and demand. Although on the given standpoint, alienation is not overcome by these means, nevertheless relations and connections are introduced thereby which include the possibility of suspending the old standpoint.) (The possibility of general statistics, etc.) (This is to be developed, incidentally, under the categories *'Prices, Demand and Supply'*. To be further noted here only that a comprehensive view over the whole of commerce and production in so far as lists of current prices in fact provide it, furnishes indeed the best proof of the way in which their own exchange and their own production confront individuals as an *objective* relation which is *independent* of them. In the case of the *world market,* the *connection of the individual* with all, but at the same time also the *independence of this connection from the individual,* have developed to such a high level that the formation of the world market already at the same time contains the conditions for going beyond it.) *Comparison* in place of real communality and generality.

(It has been said and may be said that this is precisely the beauty and the greatness of it: this spontaneous interconnection, this material and mental metabolism which is independent of the knowing and willing of individuals, and which presupposes their reciprocal independence and indifference. And, certainly, this objective connection is preferable to the lack of any connection, or to a merely local connection resting on blood ties, or on primeval, natural or master-servant relations. Equally certain is it that individuals cannot gain mastery over their own social interconnections before they have created them. But it is an insipid notion to conceive of this merely *objective bond* as a spontaneous, natural attribute inherent in individuals and inseparable from their nature (in antithesis to their conscious knowing and willing). This bond is their product. It is a historic product. It belongs to a specific phase of their development. The alien and independent character in which it presently exists *vis-à-vis* individuals proves only that the latter are still engaged in the creation of the conditions of their social life, and that they have not yet begun, on the basis of these conditions, to live it. It is the bond natural to individuals within specific and limited relations of production. Universally developed individuals, whose social relations, as their own communal [*gemeinschaftlich*] relations, are hence also subordinated to their own communal control, are no product of nature, but of history. The degree and the universality of the development of wealth where *this* individuality becomes possible supposes production on the basis of exchange values as a prior condition, whose universality produces not only the alienation of the individual from himself and from others, but also the universality and the comprehensiveness of his relations and capacities. In earlier stages of development the single individual seems to be developed more fully, because he has not yet worked out his relationships in their fullness, or erected them as independent social powers and relations opposite himself. It is as ridiculous to yearn for a return to that original fullness [22] as it is to believe that with this complete emptiness history has come to a standstill. The bourgeois viewpoint has never advanced beyond this antithesis between itself and this romantic viewpoint, and therefore the latter will accompany it as legitimate antithesis up to its blessed end.)

(The relation of the individual to science may be taken as an example here.)

(To compare money with blood – the term circulation gave occasion for this – is about as correct as Menenius Agrippa's comparison between the patricians and the stomach.) [23] (To compare money with language is not less erroneous. Language does not transform ideas, so that the peculiarity of ideas is dissolved and their social character runs alongside them as a separate entity, like prices alongside commodities. Ideas do not exist separately from language. Ideas which have first to be translated out of their mother tongue into a foreign language in order to circulate, in order to become exchangeable, offer a somewhat better analogy; but the analogy then lies not in language, but in the foreignness of language.)

(The exchangeability of all products, activities and relations with a third, *objective* entity which can be re-exchanged for everything *without distinction* – that is, the development of exchange values (and of money relations) is identical with universal venality, corruption. Universal prostitution appears as a necessary phase in the development of the social character of personal talents, capacities, abilities, activities. More politely expressed: the universal relation of utility and use. The equation of the incompatible, as Shakespeare nicely defined money. [24] Greed as such impossible without money; all other kinds of accumulation and of mania for accumulation appear as primitive, restricted by needs on the one hand and by the restricted nature of products on the other (*sacra auri fames* [25]).)

(The development of the money system obviously presupposes other, prior developments.)

When we look at social relations which create an undeveloped system of exchange, of exchange values and of money, or which correspond to an undeveloped degree of these, then it is clear from the outset that the individuals in such a society, although their relations appear to be more personal, enter into connection with one another only as individuals imprisoned within a certain definition, as feudal lord and vassal, landlord and serf, etc., or as members of a caste etc. or as members of an estate etc. In the money relation, in the developed system of exchange (and this semblance seduces the democrats), the ties of personal dependence, of distinctions of blood, education, etc, are in fact exploded, ripped up (at least, personal ties all appear as *personal* relations); and individuals *seem* independent (this is an independence which is at bottom merely an illusion and it is more correctly called indifference), free to collide with one another and to engage in exchange within this freedom; but they appear thus only for someone who abstracts from the *conditions*, the *conditions of existence* within which these individuals enter into contact (and these conditions, in turn, are independent of the individuals and, although created by society, appear as if they were *natural conditions,* not controllable by individuals). The definedness of individuals, which in the former case appears as a personal restriction of the individual by another, appears in the latter case as developed into an objective restriction of the individual by relations independent of him and sufficient unto themselves. (Since the single individual cannot strip away his personal definition, but may very well overcome and master external relations, his freedom *seems* to be greater in case 2. A closer examination of these external relations, these conditions, shows, however, that it is impossible for the individuals of a class etc. to overcome them *en masse* without destroying them. A particular individual may by chance get on top of these relations, but the mass of those under their rule cannot, since their mere existence expresses subordination, the necessary subordination of the mass of individuals.) These external relations are very far from being an abolition of ‘relations of dependence’; they are rather the dissolution of these relations into a general form; they are merely the elaboration and emergence of the general *foundation* of the relations of personal dependence. Here also individuals come into connection with one another only in determined ways. These *objective* dependency relations also appear, in antithesis to those of *personal* dependence (the objective dependency relation is nothing more than social relations which have become independent and now enter into opposition to the seemingly independent individuals; i.e. the reciprocal relations of production separated from and autonomous of individuals) in such a way that individuals are now ruled by *abstractions,* whereas earlier they depended on one another. The abstraction, or idea, however, is nothing more than the theoretical expression of those material relations which are their lord and master. Relations can be expressed, of course, only in ideas, and thus philosophers have determined the reign of ideas to be the peculiarity of the new age, and have identified the creation of free individuality with the overthrow of this reign. This error was all the more easily committed, from the ideological stand-point, as this reign exercised by the relations (this objective dependency, which, incidentally, turns into certain definite relations of personal dependency, but stripped of all illusions) appears within the consciousness of individuals as the reign of ideas, and because the belief in the permanence of these ideas, i.e. of these objective relations of dependency, is of course consolidated, nourished and inculcated by the ruling classes by all means available.

(As regards the illusion of the ‘purely personal relations’ in feudal times, etc., it is of course not to be forgotten for a moment (1) that these relations, in a certain phase, also took on an objective character within their own sphere, as for example the development of landed proprietorship out of purely military relations of subordination; but (2) the objective relation on which they founder has still a limited, primitive character and therefore *seems* personal, while, in the modern world, personal relations flow purely out of relations of production and exchange.)

The product becomes a commodity. The commodity becomes exchange value. The exchange value of the commodity acquires an existence of its own alongside the commodity; i.e. the commodity in the form in which (1) it is exchangeable with all other commodities, (2) it has hence become a commodity in general, and its natural specificity is extinguished, and (3) the measure of its exchangeability (i.e. the given relation within which it is equivalent to other commodities) has been determined – this commodity is the commodity as money, and, to be precise, not as money in general, but as a *certain definite sum of money,* for, in order to represent exchange value in all its variety, money has to be countable, quantitatively divisible.

Money – the common form into which all commodities as exchange values are transformed, i.e. the universal commodity – must itself exist as a *particular* commodity alongside the others, since what is required is not only that they can be measured against it in the head, but that they can be changed and exchanged for it in the actual exchange process. The contradiction which thereby enters, to be developed elsewhere. Money does not arise by convention, any more than the state does. It arises out of exchange, and arises naturally out of exchange; it is a product of the same. At the beginning, that commodity will serve as money – i.e. it will be exchanged not for the purpose of satisfying a need, not for consumption, but in order to be re-exchanged for other commodities – which is most frequently exchanged and circulated as an object of consumption, and which is therefore most certain to be exchangeable again for other commodities, i.e. which represents within the given social organization wealth κατ᾽ ἐξοχήν, [26] which is the object of the most general demand and supply, and which possesses a particular use value. Thus salt, hides, cattle, slaves. In practice such a commodity corresponds more closely to itself as exchange value than do other commodities (a pity that the difference between *denrée* and *marchandise* cannot be neatly reproduced in German). It is the particular usefulness of the commodity whether as a particular object of consumption (hides), or as a direct instrument of production (slaves), which stamps it as money in these cases. In the course of further development precisely the opposite will occur, i.e. that commodity which has the least utility as an object of consumption or instrument of production will best serve the needs of *exchange as such.* In the former case, the commodity becomes money because of its particular use value; in the latter case it acquires its particular use value from its serviceability as money. The precious metals last, they do not alter, they can be divided and then combined together again, they can be transported relatively easily owing to the compression of great exchange value in little space – for all these reasons they are especially suitable in the latter stage. At the same time, they form the natural transition from the first form of money. At somewhat higher levels of production and exchange, the instrument of production takes *precedence* over products; and the *metals* (prior to that, stones) are the first and most indispensable instruments of production. Both are still combined in the case of *copper,* which played so large a role as money in antiquity; here is the particular use value as an instrument of production together with other attributes which do not flow out of the use value of the commodity but correspond to its function as exchange value (including medium of exchange). The *precious* metals then split off from the remainder by virtue of being inoxidizable, of standard quality etc., and they correspond better, then, to the higher stage, in that their direct utility for consumption and production recedes while, because of their rarity, they better represent value purely based on exchange. From the outset they represent superfluity, the form in which wealth originates. Also, metals preferably exchanged for metals rather than for other commodities.

The first form of money corresponds to a low stage of exchange and of barter, in which money still appears more in its quality of *measure* rather than as a real *instrument of exchange.* At this stage, the measure can still be purely imaginary (although the bar in use among Negroes includes iron) (sea shells etc., however, correspond more to the series of which gold and silver form the culmination).

From the fact that the commodity develops into general exchange value, it follows that exchange value becomes a specific commodity: it can do so only because a specific commodity obtains the privilege of representing, symbolizing, the exchange value of all other commodities, i.e. of becoming *money*. It arises from the essence of exchange value itself that a specific commodity appears as the money-subject, despite the monetary properties possessed by every commodity. In the course of development, the exchange value of money can again exist separately from its matter, its substance, as in the case of paper money, without therefore giving up the privilege of this specific commodity, because the separated form of existence of exchange value must necessarily continue to take its denomination from the specific commodity.

It is because the commodity is exchange value that it is exchangeable for money, is posited = to money. The proportion of its equivalence with money, i.e. the specificity of its exchange value, is *presupposed* before its transposition into money. The proportion in which a particular commodity is exchanged for money, i.e. the quantity of money into which a given quantity of a commodity is transposable, is determined by the amount of labour time objectified in the commodity. The commodity is an exchange value because it is the realization of a *specific* amount of labour time; money not only measures the amount of labour time which the commodity represents, but also contains its general, conceptually adequate, exchangeable form. Money is the physical medium into which exchange values are dipped, and in which they obtain the form corresponding to their general character. Adam Smith says that labour (labour time) is the original money with which all commodities are purchased. [27] As regards the act of production, this always remains true (as well as in the determination of relative values). In production, every commodity is continuously exchanged for labour time. The necessity of a money other than labour time arises precisely because the quantity of labour time must not be expressed in its immediate, particular product, but in a mediated, general product; in its particular product, as a product equal to and convertible into all other products of an equal labour time; of the labour time not in a particular commodity, but in all commodities at once, and hence in a particular commodity which represents all the others. Labour time cannot directly be money (a demand which is the same, in other words, as demanding that every commodity should simply be its own money), precisely because in fact labour time always exists only in the form of particular commodities (as an object): being a general object, it can exist only symbolically, and hence only as a particular commodity which plays the role of money. Labour time does not exist in the form of a general object of exchange which is independent of and separate (in isolation) from the particular natural characteristics of commodities. But it would have to exist in that form if it were directly to fulfil the demands placed on money. The objectification of the general, social character of labour (and hence of the labour time contained in exchange value) is precisely what makes the product of labour time into exchange value; this is what gives the commodity the attributes of money, which however, in turn imply the existence of an independent and external money-subject.

A particular expenditure of labour time becomes objectified in a definite particular commodity with particular properties and a particular relationship to needs; but, in the form of exchange value, labour time is required to become objectified in a commodity which expresses no more than its quota or quantity, which is indifferent to its own natural properties, and which can therefore be metamorphosed into – i.e. exchanged for – every other commodity which objectifies the same labour time. The object should have this character of generality, which contradicts its natural particularity. This contradiction can be overcome only by objectifying it: i.e. by positing the commodity in a double form, first in its natural, immediate form, then in its mediated form, as money. The latter is possible only because a particular commodity becomes, as it were, the general substance of exchange values, or because the exchange values of commodities become identified with a particular commodity different from all others. That is, because the commodity first has to be exchanged for this general commodity, this symbolic general product or general objectification of labour time, before it can function as exchange value and be exchanged for, metamorphosed into, any other commodities at will and regardless of their material properties. Money is labour time in the form of a general object, or the objectification of general labour time, labour time as a *general commodity*. Thus, it may seem a very simple matter that labour time should be able to serve directly as money (i.e. be able to furnish the element in which exchange values are realized as such), because it regulates exchange values and indeed is not only the inherent measure of exchange values but their substance as well (for, as exchange values, commodities have no other substance, no natural attributes). However, this appearance of simplicity is deceptive. The truth is that the exchange-value relation – of commodities as mutually equal and equivalent objectifications of labour time – comprises contradictions which find their objective expression in a *money which is distinct from* labour time.

In Adam Smith this contradiction still appears as a set of parallels. Along with the particular product of labour (labour time as a particular object), the worker also has to produce a quantity of the general commodity (of labour time as general object). The two determinants of exchange value appear to Smith as existing externally, *alongside* one another. The interior of the commodity as a whole does not yet appear as having been seized and penetrated by contradiction. This corresponds to the stage of production which Smith found in existence at that time, in which the worker still directly owned a portion of his subsistence in the form of the product; where neither his entire activity nor his entire product had become dependent on exchange; i.e. where subsistence agriculture (or something similar, as Steuart calls it) [28] still predominated to a great extent, together with patriarchal industry (hand weaving, domestic spinning, linked closely with agriculture). Still it was only the excess which was exchanged within a large area of the nation. Exchange value and determination by labour time not yet fully developed on a national scale.

(*Incidental remark:* It is less true of gold and silver than of any other commodities that their consumption can grow only in inverse proportion to their costs of production. Their consumption grows, rather, in proportion with the growth of general wealth, since their use specifically represents wealth, excess, luxury, because they themselves *represent* wealth in general. Apart from their use as money, silver and gold are consumed more in proportion as wealth in general increases. When, therefore, their supply suddenly increases, even if their costs of production or their value does not proportionately decrease, they find a rapidly expanding market which retards their depreciation. A number of problems which appear inexplicable to the economists – who generally make consumption of gold and silver dependent solely on the decrease in their costs of production – in regard to the *California-Australia case,* [29] where they go around in circles, are thereby clarified. This is precisely linked with their property as money, as representation of wealth.)

(The contrast between gold and silver, as eternal commodities, and the others, which are not, is to be found in Petty, [30] but is already present in Xenophon, *On Revenues,* in reference to marble and silver. ‘οὐ μόνον δὲ κρατεῖ τοῖς ἐπ᾽ ἐνιαυτὸν θάλλουσί τε καὶ γηράσκουσιν, ἀλλὰ καὶ ἀίδια ἀγαθὰ ἔχει ἡ χώρα. πέφυκε μὲν γὰρ λίθος ἐν αὐτῆ ᾄφθονος, etc. (namely marble) ἔστι δὲ καὶ γῆ, ἣ σπειρομὲνη μὲν οὐ φέρει καρπόν, ὀρυττομένη δὲ πολλαπλασίους τρέφει ἢ ἐι σῖτον ἒφεφε.’) [31] (Important to note that exchange between different tribes or peoples – and this, not private exchange, is its first form – begins when an uncivilized tribe sells (or is cheated out of) an excess product which is not the product of its labour, but the natural product of the ground and of the area which it occupies.)

(Develop the ordinary economic contradictions arising from the fact that money has to be symbolized in a particular commodity, and then develop those that arise from this commodity itself (gold, etc.) This No. II. [32] Then determine the relation between the quantity of gold and silver and commodity prices, and whether the exchange takes place in reality or only in the mind, since all commodities have to be exchanged for money in order to be determined as *prices*. This No. III. [33] It is clear that, merely *measured* in gold or silver, the quantity of these metals has no influence on the prices of commodities; the difficulty enters with actual exchange, where the metals actually serve as instruments of exchange; the relations of demand and supply etc. But it is obviously as a measure that its value as an instrument of circulation is affected.)

Labour time itself exists as such only subjectively, only in the form of activity. In so far as it is exchangeable (itself a commodity) as such, it is defined and differentiated not only quantitatively but also qualitatively, and is by no means general, self-equivalent labour time; rather, labour time as subject corresponds as little to the general labour time which determines exchange values as the particular commodities and products correspond to it as object.

A. Smith’s thesis, that the worker has to produce a general commodity alongside his particular commodity, in other words that he has to give a part of his products the form of money, more generally that he has to convert into money all that part of his commodity which is to serve not as use value for himself but as exchange value – this statement means, subjectively expressed, nothing more than that the worker’s particular labour time cannot be directly exchanged for every other particular labour time, but rather that this, its general exchangeability, has first to be mediated, that it has first to take on an objective form, a form different from itself, in order to attain this general exchangeability.

The labour of the individual looked at in the act of production itself, is the money with which he directly buys the product, the object of his particular activity; but it is a *particular* money, which buys precisely only this *specific* product. In order to be *general money* directly, it would have to be not a *particular,* but *general* labour from the outset; i.e. it would have to be *posited* from the outset as a link in *general production.* But on this presupposition it would not be exchange which gave labour its general character; but rather its presupposed communal character would determine the distribution of products. The communal character of production would make the product into a communal, general product from the outset. The exchange which originally takes place in production – which would not be an exchange of exchange values but of activities, determined by communal needs and communal purposes – would from the outset include the participation of the individual in the communal world of products. On the basis of exchange values, labour is *posited* as general only through *exchange*. But on this foundation it would be *posited* as such before exchange; i.e. the exchange of products would in no way be the *medium* by which the participation of the individual in general production is mediated. Mediation must, of course, take place. In the first case, which proceeds from the independent production of individuals – no matter how much these independent productions determine and modify each other *post festum* through their interrelations – mediation takes place through the exchange of commodities, through exchange value and through money; all these are expressions of one and the same relation. In the second case, the *presupposition is itself mediated;* i.e. a communal production, communality, is presupposed as the basis of production. The labour of the individual is posited from the outset as social labour. Thus, whatever the particular material form of the product he creates or helps to create, what he has bought with his labour is not a specific and particular product, but rather a specific share of the communal production. He therefore has no particular product to exchange. His product is *not an exchange value.* The product does not first have to be transposed into a particular form in order to attain a general character for the individual. Instead of a division of labour, such as is necessarily created with the exchange of exchange values, there would take place an organization of labour whose consequence would be the participation of the individual in communal consumption. In the first case the social character of production is *posited* only *post festum* with the elevation of products to exchange values and the exchange of these exchange values. In the second case the *social character of production* is presupposed, and participation in the world of products, in consumption, is not mediated by the exchange of mutually independent labours or products of labour. It is mediated, rather, by the social conditions of production within which the individual is active. Those who want to make the labour of the individual directly into *money* (i.e. his product as well), into *realized exchange value,* want therefore to determine that labour *directly* as general labour, i.e. to negate precisely the conditions under which it must be made into money and exchange values, and under which it depends on private exchange. This demand can be satisfied only under conditions where it can no longer be raised. Labour on the basis of exchange values presupposes, precisely, that neither the labour of the individual nor his product are *directly* general; that the product attains this form only by passing through an *objective mediation* by means of a form of *money* distinct from itself.

On the basis of communal production, the determination of time remains, of course, essential. The less time the society requires to produce wheat, cattle etc., the more time it wins for other production, material or mental. Just as in the case of an individual, the multiplicity of its development, its enjoyment and its activity depends on economization of time. Economy of time, to this all economy ultimately reduces itself. Society likewise has to distribute its time in a purposeful way, in order to achieve a production adequate to its overall needs; just as the individual has to distribute his time correctly in order to achieve knowledge in proper proportions or in order to satisfy the various demands on his activity. Thus, economy of time, along with the planned distribution of labour time among the various branches of production, remains the first economic law on the basis of communal production. It becomes law, there, to an even higher degree. However, this is essentially different from a measurement of exchange values (labour or products) by labour time. The labour of individuals in the same *branch of work,* and the various kinds of work, are different from one another not only quantitatively but also qualitatively. What does a solely *quantitative* difference between things presuppose? The identity of their *qualities.* Hence, the quantitative measure of labours presupposes the equivalence, the identity of their quality.

(Strabo, Book XI. On the Albanians of the Caucasus: ‘καὶ οἱ ἄνθρωνοι κάλλει καὶ μεγέθει διαφέροντες, άπλοῖ δὲ καὶ οὐ καπηλικοί · οὐδἐ γὰρ νομίσματι τὰ πολλὰ κρῶνται, οὐδὲ ἀριθμὸν ἴσασι μείζω τῶν ἑκατόν, ἀλλὰ φορτίοις τὰς ἀμοιβὰς ποιοῦνται.’ It says there further: ‘ἄπειροι δ’ εἰσὶ καὶ μέτρων τῶν ἐπ’ ἀκριβὲς καὶ σταθμῶν.’) [34]

Money appears as *measure* (in Homer, e.g. oxen) earlier than as *medium of exchange,* because in barter each commodity is still its own medium of exchange. But it cannot be its own measure or its own standard of comparison.

(2) [35] This much proceeds from what has been developed so far: A particular product (commodity) (material) must become the subject of money, which exists as the attribute of every exchange value. The subject in which this symbol is represented is not a matter of indifference, since the demands placed

on the representing subject are contained in the conditions – conceptual determinations, characteristic relations – of that which is to be represented. The study of the precious metals as subjects of the money relations, as incarnations of the latter, is therefore by no means a matter lying outside the realm of political economy, as Proudhon believes, any more than the physical composition of paint, and of marble, lie outside the realm of painting and sculpture. The attributes possessed by the commodity as exchange value, attributes for which its natural qualities are not adequate, express the demands made upon those commodities which κατ᾽ ἐξοχήν [36] are the material of money. These demands, at the level to which we have up to now confined ourselves, are most completely satisfied by the precious metals. Metals as such [enjoy] preference over other commodities as instruments of production, and among the metals the one which is first found in its physical fullness and purity – gold; then copper, then silver and iron. The precious metals take preference over others in realizing *metal,* as Hegel would say. [37]

The precious metals uniform in their physical qualities, so that equal quantities of them should be so far identical as to present no ground for preferring this one to the others. Not the case, for example, with equal numbers of cattle and equal quantities of grain.

(a) Gold and silver in relation to the other metals

The other metals oxidize when exposed to air; the precious metals (mercury, silver, gold, platinum) are unaffected by the air.

Aurum (Au). Specific gravity = 19.5; melting point: 1,200° C, ‘Glittering gold is the most magnificent of all metals, and was therefore referred to in antiquity as the sun or the king of metals. Widely distributed, never in great quantities, and is hence also more precious than the other metals. Found generally in pure metallic state, partly in larger pieces, partly in the form of smaller granules fused with other minerals. As the latter decompose, there arises gold-bearing sand, carried by many rivers, from which gold, owing to its greater specific gravity, can be washed out. Enormous malleability of gold; one grain can be drawn to make a 500-foot long wire, and can be hammered into leaves barely 1/200,000 of an inch thick. Gold resists all acids, only chlorine in a free state dissolves it (*aqua regia,* a mixture of nitric and hydrochloric acids). To gild.’

Argentum (Ag). Specific gravity = 10. Melting point = 1,000° C. Bright appearance; the friendliest of metals, very white and malleable; can be beautifully worked up and drawn in very thin wires. Silver found as unalloyed solid; frequently also combined with lead in silvery lead ores.

So much for *chemical* properties of gold and silver. (Divisibility and fusibility, uniformity of pure gold and silver etc. well known.)

Mineralogical:

Gold. It is surely noteworthy that the more precious the metals are, the more isolated is their occurrence; they are found separately from the more commonly prevalent bodies, they are higher natures far from the common herd. Thus we find gold, as a rule, in unalloyed metallic state, as a crystal in various die-shaped forms, or in the greatest variety of shapes; irregular pieces and nuggets, sand and dust, in which form it is found fused into many kinds of stone, e.g. granite: and it finds its way into the sand of rivers and the gravel of floodlands as a result of the disintegration of this stone. Since the specific gravity of gold in this state goes up to 19.4, even the tiniest pieces can be extracted by stirring gold-bearing sand in water. The heavier, metallic elements settle first and can thus, as the saying goes, be washed out. Most frequently found in the company of gold is silver, and one encounters natural combinations of both metals, containing from 0.16 to 38.7 per cent silver; which naturally entails differences in colour and weight.

Silver. With the great variety of its minerals, appears as one of the more prevalent metals, both as unalloyed metal and combined with other metals or with arsenic and sulphur. (Silver chloride, silver bromide, carbonic silver oxide, bismuth-silver ore, Sternbergite, polybasite, etc.)

The chief *chemical* properties are: *all precious metals:* do not oxidize on contact with air; of gold (and platinum): are not dissolved by acids, except in chlorine. Do not oxidize, thus remain pure, free of rust; they present themselves as that which they are. Resistance to oxygen – *imperishability* (so highly lauded by the gold and silver fanatics of antiquity).

Physical properties: Specific gravity, i.e. a great deal of weight in a small space, especially important for means of circulation. Gold 19.5, silver 10.

Brilliance. Gleam of gold, whiteness of silver, magnificence, *malleability;* hence so serviceable for jewellery, ornamentation, and for the addition of splendour to other objects. The *white* shade of silver (which reflects all light rays in their original composition); red-yellow of gold (which absorbs all colours of a mixed beam and reflects back only the red). *Difficult to melt.*

Geological properties: Found (gold especially) as an unalloyed solid, separate from other bodies; isolated, individualized. Individual presentation, independent of the elemental.

About the two other precious metals: (1) *Platinum* lacks the colour: grey on grey (soot of metals); too rare; unknown in antiquity; discovered only after the discovery of America; also discovered in the Urals in the nineteenth century; soluble only in chlorine; always solid; specific gravity = 21; the strongest fire does not melt it; more of scientific value. (2) *Mercury:* found in liquid form; evaporates; vapours poisonous; can be combined with other liquids (amalgams). (Specific gravity = 13.5, boiling point = 360° C.) Thus neither platinum, nor much less mercury, are suitable as money.

One of the *geological* properties is common to all the precious metals: *rarity.* Rarity (apart from supply and demand) is an element of value only in so far as its opposite, the non-rare as such, the negation of rarity, the elemental, has no value because it does not appear as the result of production. In the original definition of value, that which is most independent of conscious, voluntary production is the most valuable, assuming the existence of demand. Common pebbles have no value, relatively speaking, because they are to be had *without production* (even if the latter consists only of searching). For something to become an object of exchange, to have exchange value, it must not be available to everyone without the mediation of exchange; it must not appear in such an elemental form as to be common property. To this extent, rarity is an element of exchange value and hence this property of the precious metal is of importance, even apart from its further relation to supply and demand.

When we look at the advantages of the metals as such as instruments of production, then gold has to its credit that it is at bottom the *first metal to be discovered as metal.* For a double reason. *First,* because more than the others, it presents itself in nature as the most metallic, the most distinct and distinguishable metal; *second,* because in its preparation nature has done the work otherwise left to artifice, and for its first discovery only rough labour is necessary, but neither science nor developed instruments of production.

‘Certain it is that gold must take its place as *the earliest metal known*, and in the first record of man’s progress it is indicated as a standard of man’s position’ (because in the form of excess, the first form in which wealth appears. The first form of value is *use value,* the everyday quality that expresses the relation of the individual to nature; the second, exchange value ALONGSIDE use value, its command over other people’s use values, its social connectedness: exchange value is itself originally a value for use on Sundays only, going beyond immediate physical necessity.)

Very early discovery of gold by man: ’Gold differs remarkably from the other metals, with a very few exceptions, in the fact that it is found in nature in its metallic state. Iron and copper, tin, lead and silver are ordinarily discovered in chemical combinations with oxygen, sulphur, arsenic, or carbon; and the few exceptional occurrences of these metals in an uncombined, or, as it was formerly called, virgin state, are to be cited rather as mineralogical curiosities than as common productions. Gold is, however, always found native or metallic … Therefore, as a metallic mass, curious by its yellow colour, it would attract the eye of the most uneducated man, whereas the other substances likely to lie in his path would offer no features of attraction to his scarcely awakened powers of observation. Again gold, from the circumstance of its having been formed in those rocks which are most exposed to atmospheric action, is found in the *débris* of the mountains. By the disintegrating influences of the atmosphere, of changes of temperature, of the action of water, and particularly by the effects of ice, fragments of rock are continually broken off. These are borne by floods into the valleys and rolled into pebbles by the constant action of flowing water. Amongst these, pebbles, or particles, of gold are discovered. The summer heats, by drying up the waters, rendered those beds which had formed river channels and the courses of winter torrents paths for the journeys of migratory man; and here we can imagine the early discovery of gold.’

‘Gold most frequently occurs pure, or, at all events, so nearly so that its metallic nature can be at once recognized, in rivers as well as in quartz veins.’

‘The specific gravity of quartz, and of most other heavy compact rocks is about 2 1/2, whilst the specific gravity of gold is 18 or 19. Gold, therefore, is somewhere about seven times as heavy as any rock or stone with which it is likely to be associated. A current of water accordingly having sufficient strength to bear along sand or pebbles of quartz or any other rock, might not be able to move the fragments of gold associated with them. Moving water, therefore, has done for the auriferous rocks formerly, just what the miner would do now, break it, namely, up, into fragments, sweep away the lighter particles, and leave the gold behind it. Rivers are, indeed, great natural *cradles,* sweeping off all the lighter and finer particles at once, the heavier ones either sticking against natural impediments, or being left whenever the current slackens its force or velocity.' (See *Gold (Lectures on).* London, 1852.) (pp. 12 and 13.) [38]

'In all probability, from tradition and early history, the *discovery of gold in the sand and gravel of streams would appear to have been the first step in the recognition of metals,* and in almost all, perhaps in all, the countries of Europe, Africa and Asia, greater or smaller quantities of gold have from very early times been washed by simple contrivances from auriferous deposits. Occasionally, the success of gold-streams has been great enough to produce a pulse of excitement which has vibrated for a while through a district, but has been hushed down again. In 760 the poor people turned out in numbers to wash gold from the river sands south of Prague, and three men were able in the day to extract a mark (1/2 lb.) of gold; and so great was the consequent rush to the "diggings" that in the next year the country was visited by famine. We read of a recurrence of similar events several times within the next few centuries, although here, as elsewhere, the general attraction to surface-spread riches has subsided into regular and systematic mining.'

'Two classes of deposits in which gold is found, the *lodes or veins,* which intersect the solid rock in a direction more or less perpendicular to the horizon; and the *drift beds* or *'streams'*, in which the gold mingled with gravel, sand, or clay, has been deposited by the mechanical action of water, upon the surface of those rocks, which are penetrated to unknown depths by the lodes. To the former class belongs more specially the art of *mining*; to the latter the simple operations of *digging*. Gold mining, properly so called, is, like other mining, an art requiring the employment of capital, and of a skill only to be acquired by years of experience. There is no art practised by civilized men which requires for its full development the application of so many sciences and collateral arts. But although so essential to the miner, scarcely any of these are necessary to the gold-washer or streamer, who must trust chiefly to the strength of his arm, or the buoyancy of his health. The apparatus which he employs must necessarily be simple, so as to be conveyed from place to place, to be easily repaired if injured, and not to require any of those niceties of manipulation which would cause him to lose time in the acquiring of small quantities.'

Difference between the drift-deposits of gold, best exemplified at the present day in Siberia, California and Australia; and the fine sands annually brought down by rivers, some of which are also found to contain gold in workable quantities. The latter are of course found literally at the surface, the former may be met with under a cover of from 1 to 70 feet in thickness, consisting of soil, peat, sand, gravel, etc. The modes of working the two must be identical in principle. For the stream-worker nature has pulled down the highest, proudest and richest parts of the lodes, and so triturated and washed up the materials, that the streamer has the heaviest part of the work already done for him: whilst the miner, who attacks the poorer, but more lasting, deep-going lodes, must aid himself with all the resources of the nicest art.

Gold has justly been considered the noblest of metals from various physical and chemical properties. It is unchangeable in air and does not rust. (Its unchangeability consists precisely in its resistance against the oxygen in the atmosphere.) Of a bright reddish yellow colour when in a coherent state, and very dense. Highly malleable. Requires a strong heat to melt it. Specific gravity.

Thus three modes of its production: (1) In the river sand. Simple finding on the surface. *Washing*. (2) In river beds and floodlands. *Digging.* (3) *Mining.* Its production requires, hence, no development of the productive forces. Nature does most of the work in that regard.

(The *roots* of the words for gold, silver etc. (see Grimm); [39] here we find a number of general concepts of *brilliance,* soon to be transferred to the words, proximate to *colour*. Silver white; gold yellow; brass and gold, brass and iron exchange names. Among the Germans bronze in use before iron. Direct affinity between *aes* (bronze) and *aurum* (gold).)

Copper (*brass, bronze:* tin and copper) and gold in use before silver and iron.

'Gold in use long before silver, because it is found pure or only lightly admixed with silver; obtained by simple washing. Silver is found in general in veins threaded through the hardest rocks in primitive terrain: its extraction requires complicated labour and machines. In southern America, veins of gold are not exploited, only gold in the form of dust and nuggets in alluvial terrain. In Herodotus's time, similarly. The most ancient monuments of Greece, Asia, Northern Europe and the New World prove that the use of gold for utensils and for ornamentation is possible in a semi-barbarian condition; while the use of silver for the same purposes by itself already denotes a fairly advanced state of society. See Dureau de la Malle, Notebook. (2.) [40]

Copper as main instrument of war and peace (ibid. 2) (as *money* in Italy ibid.).

(b) Fluctuations in the value-relation between the different metals

If the use of metals as the substance of money, as well as their comparative uses, their earlier or later appearance, are to be examined at all, then it is necessary to look also at the *fluctuations in their relative value*. (Letronne, Böckh, Jacob.) [41] (That part of the question which is linked to the question of the mass of circulating metals as such, and its relation to prices, is to be looked at later, as a historical appendix to the chapter on the relation between money and prices.)

The successive fluctuations between gold, silver and copper in various epochs had to depend first of all on the nature of the sites where they are found, and on their greater or lesser purity. Then, on political changes, such as the invasion of Asia and of a part of Africa by the Persians and the Macedonians; later the conquest of parts of three continents by the Romans (*orbis Romanus,* etc.). Dependent, therefore, on their relative purity and their location.

The value relation between the different metals can be determined without recourse to prices – by means of the simple *quantitative* ratio in which one exchanges for the other. We can employ this form, in general, when we are comparing only a few commodities which have the same measure; e.g. so many quarters of rye, barley, oats for so many quarters of wheat. This method employed in barter, where little of anything is exchanged and where even fewer commodities enter the traffic, and where, hence, no money is required.

Among an *Arab* people neighbouring on Sabaea, according to Strabo, pure gold was so abundant that 10 lb. of it were given for 1 lb. of iron, and 2 lb. were given for 1 lb. silver. A wealth of gold in the Bactrian region (Bactara, etc., in short, Turkestan) and in the part of Asia situated between the Paropamisus (Hindu-kush) and the Imaus (Mustagh Mountains), i.e. in the *Desertum arenosum auro abondans* [42] (Desert of Cobi): according to Dureau de la Malle it is probable, therefore, that from the fifteenth to the sixth century B.C. the ratio of gold to silver was 6:1 or 8:1, the same which existed in China and Japan until the beginning of the nineteenth century; Herodotus puts it at 13:1 for Persia under Darius Hystaspes. According to the code of Manou, written between 1300 and 600 B.C., gold to silver = 2 1/2:1. Silver mines must nearly always be established in primitive terrain; that is where the deposits lie, and only lesser veins are found in easier ground. Instead of in alluvial sand and gravel, silver is ordinarily embedded in the most compact and hard rocks, such as quartz, etc. This metal is more common in regions which are cold, either from latitude or from elevation, while gold generally frequents warm countries. In contrast to gold, silver is only very rarely found in a pure state (usually combined with arsenic or sulphur) (muriatic acid, nitric saltpetre). As far as the quantity of deposits is concerned (prior to the discovery of Australia and California), Humboldt in 1811 estimates the proportion of gold to silver in America at 1:46, and in Europe (including Asiatic Russia) at 1:40. The mineralogists of the Académie des Sciences estimate in our time (1842) that the ratio is 1:52; despite that, the lb. of gold is only worth 15 lb. of silver; thus their value relation = 15:1.

Copper. Specific gravity = 8.9. Beautiful dawn-red colour; fairly hard; requires very high temperatures to melt. Not infrequently encountered pure; frequently combined with oxygen or sulphur. Deposits found in primordial, ancient terrain. However, found more frequently close to the surface, at no great depth, agglomerated in masses of pure metal, sometimes of a considerable weight. Used in peace and war before iron. (Gold relates to silver as the substance of money in the same way as copper to iron as instrument of labour in historical development.) Circulates in great quantity in Italy under the

Romans during the first to the fifth centuries. One can determine *a priori* a people’s degree of civilization if one knows no more than the metal, gold, copper, silver or iron, which it uses for weapons, tools or ornamentation. Hesiod, in his poem on agriculture: ‘χαλκῷ δ’ ειργάζοντο μέλας δ’ οὐκ ἔσκε σίδηρος’. [43]

Lucretius: ‘*Et prior aeris erat quam ferri cognitus usus.*’ [44] Jacob cites ancient copper mines in Nubia and Siberia (see Dureau I, 58); Herodotus says that the Massagetians had only bronze, but no iron. To judge by the collection known as the Oxford Marbles, iron unknown before 1431 B.C. In Homer, iron rare; however, very common use of bronze (an alloy of copper, zinc and tin) which Greek and Roman society used for a very long period, even for the fabrication of axes and razors. Italy fairly wealthy in native copper; thus copper money formed, if not the only currency, at least the normal currency, the monetary unit of central Italy, up to 247 B.C. The Greek colonies in southern Italy received silver directly from Greece and Asia, or via Tyre and Carthage; and used it for money starting in the fifth and sixth centuries. The Romans, it seems, possessed silver money prior to the expulsion of the Kings, but, Pliny says, *‘interdictum id vetere consulto patrum, Italiae parci* ‘ (i.e. the silver mines) *‘jubentium’*, [45] They feared the consequences of a convenient means of circulation – opulence, increase of slaves, accumulation, concentration of land ownership. Among the Etruscans, too, copper money before gold.

Garnier is wrong when he says (see Notebook III, p. 28), ‘The material destined for accumulation was naturally sought for and selected from the realm of the minerals.’ [46] On the contrary, accumulation began after metal money was found (whether as money proper or only as preferred medium of exchange by weight). This point to be discussed especially in regard to gold. Reitemeier is right (see Notebook III, p. 34): ‘Gold, silver and copper were used by the ancients as implements for hacking and breaking, despite their relative softness, before the advent of iron and before they were used as money.” [47] (Improvement of implements when men learned to temper copper and thus make it hard enough to defy solid rock. A very much hardened copper was used to make the chisels and hammers used for mastering rock. Finally, iron was discovered.) Jacob says: ‘In patriarchal times’ (see Notebook IV, p. 3), ‘when the metals used for making weapons, such as (1) brass and (2) iron, were rare and enormously expensive compared with the common food and clothing then used, then, although coined money made of the precious metals was still unknown, yet gold and silver had acquired the faculty of being more easily and conveniently exchanged for the other metals than corn and cattle.’ [48]

‘Besides, in order to obtain the pure or nearly pure gold found in the immense alluvial lands situated between the Hindu-kush chains and the Himalaya, only a simple washing operation was required. In those times the population in these countries of Asia was abundant, and hence labour was cheap. Silver was relatively more expensive owing to the (technical) difficulties of obtaining it. The opposite tendency set in in Asia and in Greece after the death of Alexander. The gold-bearing sands became exhausted; the price of slaves and of manpower rose; and, since mechanics and geometry had made immense progress from Euclid to Archimedes, it was possible to exploit with profit the rich veins of silver mined in Asia, in Thrace and in Spain; and, silver being 52 times more abundant than gold, the value ratio between them necessarily changed, so that the *livre* of gold, which at the time of Xenophon, 350 B.C., was exchanged for 10 *livres* of silver, came to be worth 18 *livres* of the latter metal in the year A.D. 422. [49] Thus, it rose from 10:1 to 18:1.

At the end of the fifth century A.D. an extraordinary diminution in the quantity of precious metals; a halt in mining. In the Middle Ages up to the end of the fifteenth century a relatively significant portion of money in gold coins. (The diminution affected, most of all, silver, which had previously circulated most widely.) Ratio in the fifteenth century = 10:1, in the eighteenth century 14:1 on the continent, in England = 15:1. In most of Asia, silver more as a commodity in trade; especially in China, where copper money (Tehen, a composition of copper, zinc and lead) coin of the realm; in China, gold (and silver) by weight as a commodity to balance foreign trade.

Large fluctuations in Rome between the value of copper and silver (in coins). Up to Servius, metal in bullion form, *aes rude,* for trade. The monetary unit, the copper *as* = 1 pound of copper. In the time of Servius, silver to copper = 279:1; until the beginning of the Punic war = 400:1 ; during the First Punic War = 140:1; Second Punic War = 112:1.

Gold very expensive in Rome at first, whereas silver from Carthage (and Spain); gold used only in ingots until 547. Gold to silver in trade = 13.71:1, in coins = 17.4:1, under Caesar = 12:1 (at the outbreak of the civil war, after the plunder of the *aerarium* [50] by Caesar, only 8:1); under Honorius and Arcadius (397) fixed at = 14.4:1; under Honorius and Theodosius the Younger (422)= 18:1. First silver coin in Rome minted 485; first gold coin: 547. As soon as, after the Second Punic War, the *as* was reduced to 1 ounce, it became small change; the *sesterce* (silver) the monetary unit, and all large payments made in silver. (In everyday commerce copper (later iron) remained the chief metal. Under the Emperors of the Orient and Occident, the *solidus (aureus),* i.e. gold, was the monetary standard.)

Thus, in antiquity, taking the average:

First: Relative increase in value of silver as compared with gold. Apart from special phenomena (Arabs) where gold cheaper than silver and still cheaper than iron, in Asia from the fifteenth to the sixth centuries B.C., gold to silver = 6:1 or 8:1 (the latter ratio in China and Japan until the beginning of the nineteenth century). In the Manou Code itself = 2 1/2:1. This lower ratio arises from the same causes which promote the discovery of gold as the first metal. Gold in those days chiefly from Asia and Egypt. This period corresponds to that of *copper* money in Italian history. In general, copper as main instrument of peace and war corresponds to the pre-eminence of gold among the precious metals. Even in Xenophon’s time, gold to silver = 10:1.

Secondly: after the death of Alexander, relative rise in the value of gold compared to silver, with the exhaustion of the gold-bearing sand, progress in technology and civilization; and hence establishment of silver mines; now the influence of the quantitatively greater prevalence of silver over gold in the earth’s crust. But especially the Carthaginians, the exploitation of Spain, which necessarily had to revolutionize the relation of silver to gold in somewhat the same way as the discovery of American silver at the end of the fifteenth century. Ratio in Caesar’s time = 17:1; later 14: 1; finally, after A.D. 422 = 18: l. (The decline of gold under Caesar for accidental reasons.) The decline of silver relative to gold corresponds to iron being the chief instrument of production in war and peace. While in the first period, influx of gold from the East, in the second, influx of silver from the cooler West.

Thirdly in the Middle Ages: Again the ratio as in the time of Xenophon, 10:1. (In some places = 12:1?)

Fourthly, after the discovery of America: Again about the ratio as in the time of Honorius and Arcadius (397); 14 to 15:1. Although since about 1815–44 an increase in the production of gold, gold was at a premium (e.g. in France). It is probable that the discovery of California and Australia

fifthly, will reintroduce the ratio of the Roman Imperium, 18: 1, if not greater. The relative depreciation of silver due to progress in the production of precious metals, in antiquity as well as after, [proceeds] from East to West, until California and Australia reverse this. In the short run, great fluctuations; but when one looks at the main differences, these repeat themselves in a remarkable fashion.

In antiquity, copper three or four times as expensive as today. (Garnier.)

(c) Now to be examined, the sources of gold and silver and their connection with historical development.

(d) *Money as coin.* Briefly the historical aspect of coins. Depreciation and appreciation, etc.

Circulation, or the *turnover of money,* corresponds to an opposite *circulation, or turnover, of commodities.* A commodity possessed by A passes into the hands of B, while B’s money passes into the hands of A, etc. The circulation of money, like that of commodities, begins at an infinity of different points, and to an infinity of different points it returns. Departures from a single centre to the different points on the periphery and the return from all points of the periphery to a single centre do not take place in the circulatory process at the stage here being examined, i.e. its *direct* stage; they belong, rather, in a circulatory system *mediated* by a banking system. This first, spontaneous and natural circulation does consist, however, of a mass of turnovers. Circulation proper, nevertheless, begins only where gold and silver cease to be commodities; between countries which export precious metals and those which import them, no circulation in this sense takes place, but mere simple exchange, since gold and silver function here not as money but as commodities. Where money plays the role of mediating the exchange of commodities (that means here their circulation) and is hence a means of exchange, it is an *instrument of circulation, a vehicle of circulation;* but wherever, in this process, it is itself circulated, where it changes hands along its own lines of motion, there it itself has a *circulation, monetary circulation, monetary turnover.* The aim is to find out to what extent this circulation is determined by particular laws. This much is clear from the outset: if money is a vehicle of circulation for the commodity, then the commodity is likewise a vehicle for the circulation of money. If money circulates commodities, then commodities circulate money. The circulation of commodities and the circulation of money thus determine one another. As regards monetary turnover, three things merit attention: (1) the form of the movement itself; the line which it describes (its concept); (2) the quantity of money circulating; (3) the rate at which it completes its motion, its velocity of circulation. This can happen only in connection with the circulation of commodities. This much is clear from the outset, that there are moments in the circulation of commodities which are entirely independent of the circulation of money, and which either directly determine the latter, or which are determined along with monetary circulation by a third factor, as in the case of, e.g., the velocity. The overall character of the mode of production will determine them both, and will determine the circulation of commodities more directly. The mass of persons engaged in exchange (population): their distribution between the town and the country; the absolute quantity of commodities, of products and agencies of production; the relative mass of commodities which enter into circulation; the development of the means of communication and transport, in the double sense of determining not only the sphere of those who are in exchange, in contact, but also the speed with which the raw material reaches the producer and the product the consumer; finally the development of industry, which concentrates different branches of production, e.g. spinning, weaving, dyeing, etc., and hence makes superfluous a series of intermediate exchanges. The circulation of commodities is the original precondition of the circulation of money. To what extent the latter then reacts back on the circulation of commodities remains to be seen.

The first task is firmly to establish the *general concept of circulation or of turnover.*

But first let us note that what is circulated by money is exchange value, hence *prices.* Hence, as regards the circulation of commodities, it is not only their mass but, equally, their prices which must be considered. A large quantity of commodities at a low exchange value (price) obviously requires less money for its circulation than a smaller quantity at double the price. Thus, actually, the concept of price has to be developed *before* that of circulation. Circulation is the positing of prices, it is the process in which commodities are transformed into prices: their realization as prices. Money has a dual character: it is (1) *measure*, or element in which the commodity is realized as exchange value, and (2) *means of exchange,* instrument of circulation, and in each of these aspects it acts in quite opposite directions. Money only circulates commodities which have already been *ideally* transformed into money, not only in the head of the individual but in the conception held by society (directly, the conception held by the participants in the process of buying and selling). This ideal transformation into money is by no means determined by the same laws as the real transformation. Their interrelation is to be examined.

(a) An essential characteristic of circulation is that it circulates exchange values (products or labour), and, in particular, exchange values in the form of *prices*. Thus, not every form of commodity exchange, e.g. barter, payment in kind, feudal services, etc., constitutes circulation. To get circulation, two things are required above all: *Firstly*: the precondition that commodities are prices; *Secondly*: not isolated acts of exchange, but a circle of exchange, a totality of the same, in constant flux, proceeding more or less over the entire surface of society; a system of acts of exchange. The commodity is specified as an exchange value. As an exchange value, it functions in a given proportion (relative to the labour time contained in it) as equivalent for all other values (commodities); but it does not directly correspond to this, its function. As an exchange value it differs from itself as a natural, material thing. A mediation is required to posit it as an exchange value. Money presents the exchange value of the commodity to the commodity as something different from itself. The commodity which is posited as money is, at the outset, the commodity as pure exchange value, or, the commodity as pure exchange value is money. But at the same time, money now exists outside and alongside the commodity; its exchange value, the exchange value of all commodities, has achieved an existence independent of the commodity, an existence based in an autonomous material of its own, in a particular commodity. The exchange value of the commodity expresses the totality of the quantitative relations in which all other commodities can be exchanged for it, determined by the unequal quantities of the same which can be produced in the same labour time. Money then exists as the exchange value of all commodities alongside and outside them. It is the universal material into which they must be dipped, in which they become gilded and silver-plated, in order to win their independent existence as exchange values. They must be translated into money, expressed in money. Money becomes the general denomination of exchange values, of commodities as exchange values. Exchange value expressed as money, i.e. equated with money, is *price*. After money has been posited as independent in relation to exchange values, then the exchange values are posited in their particularity in relation to their subject, money. But every exchange value is a particular quantity; a quantitatively specific exchange value. As such, it is = a particular quantity of money. This particularity is given, in the general law, by the amount of labour time contained in a given exchange value. Thus an exchange value which is the product of, say, one day is expressed in a quantity of gold or silver which = one day of labour time, which is the product of one day of labour. The general measure of exchange values now becomes the measure which exists between each exchange value and the money to which it is *equated*. (Gold and silver are determined, in the first place, by their cost of production in the country of production. 'In the mining countries all prices ultimately depend on the costs of production of the precious metals; ... the remuneration paid to the miner, ... affords the scale, on which the remuneration of all other producers is calculated. The gold value and silver value of all commodities exempt from monopoly depends in a country without mines on the gold and silver which can be obtained by exporting the result of a given quantity of labour, the current rate of profit, and, in each individual case, the amount of wages, which have been paid, and the time for which they have been advanced.' (Senior.) [51] In other words: on the quantity of gold and silver which is directly or indirectly obtained from the mining countries in exchange for a given quantity of labour (exportable products). Money is in the first instance that which expresses the relation of equality between all exchange values: in money, they all have the same name.)

Exchange value, posited in the character of money, is price. Exchange value is expressed in price as a specific quantity of money. Money as price shows first of all the *identity* of all exchange values; secondly, it shows the unit of which they all contain a given number, so that the equation with money expresses the quantitative specificity of exchange values, their quantitative relation to one another. Money is here posited, thus, as the *measure* of exchange values; and prices as exchange values measured in money. The fact that money is the measure of prices, and hence that exchange values are compared with one another on this standard, is an aspect of the situation which is self-evident. But what is more important for the analysis is that *in price, exchange value is compared with money.* After money has been posited as independent exchange value, separated from commodities, then the individual commodity, the particular exchange value, is again *equated* to money, i.e. it is posited as equal to a given quantity of money, expressed as money, translated into money. By being equated to money, they again become related to one another as they were, conceptually, as exchange values: they balance and equate themselves with one another in given proportions. The particular exchange value, the commodity, becomes expressed as, subsumed under, posited in the character of the independent exchange value, of money. How this happens (i.e. how the quantitative relation between the quantitatively defined exchange value and a given quantity of money is found), above. But, since money has an independent existence apart from commodities, the price of the commodity appears as an *external* relation of exchange values or commodities to money; the commodity *is not price,* in the way in which its social substance stamped it as exchange value; this quality is not *immediately* coextensive with it; but is mediated by the commodity's comparison with money; the commodity *is* exchange value, but it *has* a price. Exchange value was in immediate identity with it, it was its immediate quality, from which it just as immediately split, so that on one side we found the commodity, on the other (as money) its exchange value; but now, as *price*, the commodity relates to money on one side as something existing outside itself, and secondly, it is *ideally* posited as money itself, since money has a reality different from it. The price is a property of the commodity, a quality in which it is *presented* as money. It is no longer an immediate but a reflected quality of it. Alongside real money, there now exists the commodity as ideally posited money.

This next characteristic, a characteristic of money *as measure* as well as of the commodity as *price,* is most easily shown by means of the distinction between *real money* and *accounting money.* As measure, money always serves as accounting money, and, as price, the commodity is always transformed only ideally into money.

‘The appraisal of the commodity by the seller, the offer made by the buyer, the calculations, obligations, rents, inventories, etc., in short, everything which leads up to and precedes the material act of payment, must be expressed in accounting money. Real money intervenes only in order to realize payments and to balance (liquidate) the accounts. If I must pay 24 *livres* 12 *sous*, then accounting money presents 24 units of one sort and 12 of another, while in reality I shall pay in the form of two material pieces: a gold coin worth 24 *livres* and a silver coin worth 12 *sous*. The total mass of real money has necessary limits in the requirements of circulation. Accounting money is an ideal measure, which has no limits other than those of the imagination. Employed to *express every sort of wealth if considered from the aspect of its exchange value alone;* thus, national wealth, the income of the state and of individuals; the accounting values, regardless of the form in which these values may exist, regulated in one and the same form; so that there is not a single article in the mass of consumable objects which is not several times transformed into money by the mind, while, compared to this mass, the total sum of effective money is, at the most = 1:10.’ (Garnier.) [52] (This last ratio is poor. 1: many millions is more correct. But this entirely unmeasurable.)

Thus, just as originally money expressed exchange value, so does the commodity as price, as ideally posited, mentally realized exchange value, now express a sum of money: money in a definite proportion. As prices, all commodities in their different forms are representatives of money, whereas earlier it was money, as the independent form of exchange value, which was the representative of all commodities. After money is posited as a commodity in reality, the commodity is posited as money in the mind.

It is clear so far, then, that in this ideal transformation of commodities into money, or in the positing of commodities as *prices*, the quantity of really available money is altogether a matter of indifference, for two reasons: *Firstly*: the ideal transformation of commodities into money is *prima facie* independent of and unrestricted by the mass of real money. Not a single piece of money is required in this process, just as little as a measuring rod (say, a yardstick) really needs to be employed before, for example, the ideal quantity of yards can be expressed. If, for example, the entire national wealth of England is appraised in terms of money, i.e. expressed as a price, everyone knows that there is not enough money in the world to realize this price. Money is needed here only as a category, as a mental relation. *Secondly*: because money functions as a unit, that is, the commodity is expressed in such a way that it contains a definite sum of equal parts of money, is measured by it, it follows that the measure between both [is] the general measure of exchange values – costs of production or labour time. Thus if 1/3 of an ounce of gold is the product of 1 working day, and the commodity x is the product of 3 working days, then the commodity x = 1 oz. or £3 17s. 4d. With the measurement of money and of the commodity, the original measure of exchange values enters again. Instead of being expressed in 3 working days, the commodity is expressed in the quantity of gold or silver which is the product of 3 working days. The quantity of really available money obviously has no bearing on this proportion.

(*Error by James Mill*: overlooks that their cost of production and not their quantity determines the value of the precious metals, as well as the prices of commodities measured in metallic value.) [53]

('Commodities in exchange are their own reciprocal measure … But this process would require as many reference points as there are commodities in circulation. If a commodity were exchanged only for one, and not for two commodities, then it would not serve as term of comparison … Hence the necessity of a common term of comparison … This term can be purely ideal … The determination of measure is fundamental, more important than that of wages … In the trade between Russia and China silver is used to evaluate all commodities, but nevertheless this commerce is done by means of barter.' (Storch.) [54] 'The operation of measuring with money is similar to the employment of weights in the comparison of material quantities. The same name for the two units whose function is to count the weight as well as the value of each thing. *Measures of weight and measures of value the same names.* An *étalon* of invariable weight was easily found. In the case of money, the question was again the *value* of a pound of silver, which = its cost of production.’ (Sismondi.) [55] Not only the same names. Gold and silver were originally measured by weight. Thus, the *as* = 1 pound of copper among the Romans.)

‘Sheep and oxen, not gold and silver, *money* in Homer and Hesiod, as measure of value. Barter on the Trojan battlefield.’ (Jacob.) (Similarly, *slaves* in the Middle Ages. ibid.) [56]

Money can be posited in the character of measure and in that of the general element of exchange values, without being realized in its further qualities; hence also before it has taken on the form of metal money. In simple barter. However, presupposed in that case that little exchange of any kind takes place; that commodities are not developed as exchange values and hence not as *prices*. (‘A common standard in the price of anything presupposes its frequent and familiar alienation. This not the case in simple states of society. In non-industrial countries many things without definite price … Sale alone can determine prices, and frequent sale alone can fix a standard. The frequent sale of articles of first necessity depends on the relation between town and country’ etc.) [57]

A developed determination of prices presupposes that the individual does not directly produce his means of subsistence, but that his direct product is an *exchange value,* and hence must first be mediated by a social process, in order to become the *means of life* for the individual. Between the full development of this foundation of industrial society and the patriarchal condition, many intermediate stages, endless nuances. This much appears from (a). If the cost of production of the precious metals rises, then all commodity prices fall; if the cost of production of the precious metals falls, then all commodity prices rise. This is the general law, which, as we shall see, is modified in particular cases.

(b) If exchange values are *ideally* transformed into money by means of prices, then, in the act of exchange, in purchase and sale, they are *really* transformed into money, exchanged for money, in order then to be again exchanged as money for a commodity. A particular exchange value must first be exchanged for exchange value in general before it can then be in turn exchanged for particulars. The commodity is realized as an exchange value only through this mediating movement, in which money plays the part of middleman.

Money thus circulates in the opposite direction from commodities. It appears as the middleman in commodity exchange, as the medium of exchange. It is the wheel of circulation, the instrument of circulation for the turnover of commodities; but, as such, it also has a circulation of its own – *monetary turnover, monetary circulation.* The price of the commodity is realized only when it is exchanged for real money, or in its real exchange for money.

This is what emerges from the foregoing. Commodities are really exchanged for money, transformed into real money, after they have been ideally transformed into money beforehand – i.e. have obtained the *attribute of price* as *prices. Prices,* therefore, are the *precondition* of monetary circulation, regardless of how much their realization appears to be a result of the latter. The circumstances which make the *prices* of commodities rise above or fall below their average value because their exchange value does so are to be developed in the section on exchange value, and precede the process of the actual *realization* of the prices of commodities through money; they thus appear, at first, as completely independent of it. The relations of numbers to one another obviously remain the same when I change them into decimal fractions. This is only giving them *another name.* In order really to circulate commodities, what is required is *instruments of transport,* and transport cannot be performed by money. If I have bought 1,000 lb. of iron for the amount of £*x,* then the ownership of the iron has passed into my hand. My £*x* have done their duty as means of exchange and have circulated, along with the title of ownership. The seller, inversely, has realized the price of iron, iron as exchange value. But in order then to bring the iron from him to me, money itself is useless; that requires wagons, horses, roads, etc. The real circulation of commodities through time and space is not accomplished by money. Money only realizes their *price* and thereby transfers the title to the commodity into the hands of the buyer, to him who has proffered means of exchange. What money circulates is not commodities but their titles of ownership; and what is realized in the opposite direction in this circulation, whether by purchase or sale, is again not the commodities, but their prices. The quantity of money which is, then, required for circulation is determined initially by the level of the prices of the commodities thrown into circulation. The sum total of these prices, however, is determined *firstly*: by the prices of the individual commodities; *secondly*: by the quantity of commodities at given prices which enter into circulation. For example, in order to circulate a quarter of wheat at 60s., twice as many s. are required as would be to circulate it at 30s. And if 5,000 of these quarters at 60s. are to be circulated, then 300,000 s. are required, while in order to circulate 200 such quarters only 12,000s. are needed. Thus, the amount of money required is dependent on the level of commodity prices and on the quantity of commodities at specified prices.

Thirdly, however, the quantity of money required for circulation depends not only on the sum total of prices to be realized, but on the rapidity with which money circulates, completes the task of this realization. If 1 thaler in one hour makes 10 purchases at 1 thaler each, if it is exchanged 10 times, then it performs quite the same task that 10 thalers would do if they made only 1 purchase per hour. Velocity is the negative moment; it substitutes for quantity; by its means, a single coin is multiplied.

The circumstances which determine the mass of commodity prices to be realized, on the one hand, and the velocity of circulation of money, on the other hand, are to be examined later. This much is clear, that prices are not high or low because much or little money circulates, but that much or little money circulates because prices are high or low; and, further, that the velocity of the circulating money does not depend on its quantity, but that the quantity of the circulating medium depends on its velocity (heavy payments are not counted but weighed; through this the time necessary is shortened).

Still, as already mentioned, the circulation of money does not begin from a single centre, nor does it return to a single centre from all points of the periphery (as with the *banks of issue* and partly with state issues); but from an infinite number of points, and returns to an infinite number (this return itself, and the time required to achieve it, a matter of chance). The velocity of the circulating medium can therefore substitute for the quantity of the circulating medium only up to a certain point. (Manufacturers and farmers pay, for example, the worker; he pays the grocer, etc.; from there the money returns to the manufacturers and farmers.) The same quantity of money can effectuate a series of payments only *successively,* regardless of the speed. But a certain mass of payments must be made *simultaneously.* Circulation takes its point of departure at one and the same time from many points. A definite quantity of money is therefore necessary for circulation, a sum which will always be engaged in circulation, and which is determined by the sum total which starts from the simultaneous points of departure in circulation, and by the velocity with which it runs its course (returns). No matter how many ebbs and floods this quantity of the circulating medium is exposed to, an average level nevertheless comes into existence; since the permanent changes are always very gradual, take place only over longer periods, and are constantly paralysed by a mass of secondary circumstances, as we shall see.

(To (a). *'Measure,* used as attribute of money, means *indicator of value'* … Ridiculous, that 'prices must fall, because commodities are judged as being worth so many ounces of gold, and the amount of gold is diminished in this country … The efficiency of gold as an indicator of value is unaffected by its quantity being greater or smaller in any particular country. If the employment of banking expedients were to succeed in reducing the paper and metal circulation in this country by half, the relative value of money and commodities would remain the same.' Example of Peru in the sixteenth century and transmission from France to England. Hubbard, VIII, 45.) [58] ('On the African coast neither gold nor silver the measure of value; instead of them, an ideal standard, an imaginary *bar.*') (Jacob, V, 15.) [59]

In its quality of being a measure, money is indifferent to its quantity, or, the existing quantity of money makes no difference. Its quantity is measured in its quality as medium of exchange, as instrument of circulation. Whether these two qualities of money can enter into contradiction with one another – to be looked at later.

(The concept of *forced, involuntary circulation* (see Steuart) [60] does not belong here yet.)

To have *circulation,* what is essential is that exchange appear as a process, a fluid whole of purchases and sales. Its first presupposition is the circulation of commodities themselves, as a natural, many-sided circulation of those commodities. The precondition of commodity circulation is that they be produced as *exchange values,* not as *immediate use values,* but as mediated through exchange value. Appropriation through and by means of divestiture [*Entäusserung*] and alienation [*Veräusserung*] is the fundamental condition. Circulation as the realization of exchange values implies: (1) that my product is a product only in so far as it is for others; hence suspended singularity, generality; (2) that it is a product for me only in so far as it has been alienated, become for others; (3) that it is for the other only in so far as he himself alienates his product; which already implies (4) that production is not an end in itself for me, but a means. Circulation is the movement in which the general alienation appears as general appropriation and general appropriation as general alienation. As much, then, as the whole of this movement appears as a social process, and as much as the individual moments of this movement arise from the conscious will and particular purposes of individuals, so much does the totality of the process appear as an objective interrelation, which arises spontaneously from nature; arising, it is true, from the mutual influence of conscious individuals on one another, but neither located in their consciousness, nor subsumed under them as a whole. Their own collisions with one another produce an alien social power standing above them, produce their mutual interaction as a process and power independent of them. Circulation, because a totality of the social process, is also the first form in which the social relation appears as something independent of the individuals, but not only as, say, in a coin or in exchange value, but extending to the whole of the social movement itself. The social relation of individuals to one another as a power over the individuals which has become autonomous, whether conceived as a natural force, as chance or in whatever other form, is a necessary result of the fact that the point of departure is not the free social individual. Circulation as the first totality among the economic categories is well suited to bring this to light.

At first sight, circulation appears as a *simply infinite* process. [61] The commodity is exchanged for money, money is exchanged for the commodity, and this is repeated endlessly. This constant renewal of the same process does indeed form an important moment of circulation. But, viewed more precisely, it reveals other phenomena as well; the phenomena of completion, or, the return of the point of departure into itself. The commodity is exchanged for money; money is exchanged for the commodity. In this way, commodity is exchanged for commodity, except that this exchange is a mediated one. The purchaser becomes a seller again and the seller becomes purchaser again. In this way, each is posited in the double and the antithetical aspect, and hence in the living unity of both aspects. It is entirely wrong, therefore, to do as the economists do, namely, as soon as the contradictions in the monetary system emerge into view, to focus only on the end results without the process which mediates them; only on the unity without the distinction, the affirmation without the negation. The commodity is exchanged in circulation for a commodity: at the same time, and equally, it is not exchanged for a commodity, in as much as it is exchanged for money. The acts of purchase and sale, in other words, appear as two mutually indifferent acts, separated in time and place. When it is said that he who sells also buys in as much as he buys money, and that he who buys also sells in as much as he sells money, then it is precisely the distinction which is overlooked, the specific distinction between commodity and money. After the economists have most splendidly shown that barter, in which both acts coincide, does not suffice for a more developed form of society and mode of production, they then suddenly look at the kind of barter which is mediated by money as if it were not so mediated, and overlook the *specific* character of this transaction. After they have shown us that money is necessary in addition to and distinct from commodities, they assert all at once that there is no distinction between money and commodities. They take refuge in this abstraction because in the real development of money there are contradictions which are unpleasant for the apologetics of bourgeois common sense, and must hence be covered up. In so far as purchase and sale, the two essential moments of circulation, are indifferent to one another and separated in place and time, they by no means need to coincide. Their indifference can develop into the fortification and apparent independence of the one against the other. But in so far as they are both essential moments of a single whole, there must come a moment when the independent form is violently broken and when the inner unity is established externally through a violent explosion. Thus already in the quality of money as a medium, in the splitting of exchange into two acts, there lies the germ of crises, or at least their possibility, which cannot be realized, except where the fundamental preconditions of classically developed, conceptually adequate circulation are present.

It has further been seen that, in circulation, money only realizes prices. The price appears at first as an ideal aspect of the commodity; but the sum of money exchanged for a commodity is its realized price, its real price. The price appears therefore as *external to* and *independent of* the commodity, as well as existing in it ideally. If the commodity cannot be realized in money, it ceases to be capable of circulating, and its price becomes merely imaginary; just as originally the product which has become transformed into exchange value, if it is not really exchanged, ceases to be a product. (The rise and fall of prices not the question here.) From viewpoint (a) *price* appeared as an *aspect of the commodity;* but from (b) *money* appears as *the price outside the commodity.* The commodity requires not simply demand, but demand which can pay in money. Thus, if its price cannot be realized, if it cannot be transformed into money, the commodity appears as *devalued, depriced.* The exchange value expressed in its price must be sacrificed as soon as this specific transformation into money is necessary. Hence the complaints by Boisguillebert, [62] e.g. that money is the hangman of all things, the moloch to whom everything must be sacrificed, the despot of commodities. In the period of the rising absolute monarchy with its transformation of all taxes into money taxes, money indeed appears as the moloch to whom real wealth is sacrificed. Thus it appears also in every monetary panic. From having been a servant of commerce, says Boisguillebert, money became its despot. [63] But, in fact, already the determination of prices in themselves contains what is counterposed to money in exchange; that money no longer represents the commodity, but the commodity, money. Lamentations about commerce in money as illegitimate commerce are to be found among several writers, who form the transition from the feudal to the modern period; the same later among socialists.

(α) The further the division of labour develops, the more does the product cease to be a medium of exchange. The necessity of a general medium of exchange arises, a medium independent of the specific production of each and every one. When production is oriented towards immediate subsistence, not *every* article can be exchanged for *every* other one, and a specific activity can be exchanged only for *specific* products. The more specialized, manifold and interdependent the products become, the greater the necessity for a general medium of exchange. At the beginning, the product of labour, or labour itself, is the general medium of exchange. But this ceases more and more to be general medium of exchange as it becomes more specialized. A fairly developed division of labour presupposes that the needs of each person have become very many-sided and his product has become very one-sided. The *need for exchange* and the *unmediated medium of exchange* develop in inverse proportion. Hence the necessity for a *general medium of exchange,* where the specific product and the specific labour must be exchanged for *exchangeability.* The exchange value of a thing is nothing other than the quantitatively specific expression of its capacity for serving as *medium of exchange.* In money the *medium of exchange* becomes a thing, or, the exchange value of the thing achieves an independent existence apart from the thing. Since the commodity is a medium of exchange of limited potency compared with money, it can cease to be a medium of exchange as against money.

(β) The splitting of exchange into purchase and sale makes it possible for me to buy without selling (stockpiling of commodities) or to sell without buying (accumulation of money). It makes speculation possible. It turns exchange into a special business; i.e. it founds the *merchant estate.* [64] This separation of the two elements has made possible a mass of transactions in between the definitive exchange of commodities, and it enables a mass of persons to exploit this divorce. It has made possible a mass of *pseudo-transactions.* Sometimes it becomes evident that what appeared to be an essentially divided act is in reality an essentially unified one; then again, sometimes, that what was thought to be an essentially unified act is in reality essentially divided. At moments when purchasing and selling assert themselves as essentially different acts, a general depreciation of all commodities takes place. At moments where it turns out that money is only a medium of exchange, a depreciation of money comes about. General fall or rise of prices.

Money provides the possibility of an absolute division of labour, because of independence of labour from its specific product, from the immediate use value of its product for it. The general rise of prices in times of speculation cannot be ascribed to a general rise in its *exchange value* or its *cost of production*; for if the *exchange value or the cost of production* of gold were to rise in step with that of all other commodities, then their exchange values expressed in money, i.e. their *prices,* would remain the same. Nor can it be ascribed to a decline in the production price of gold. (Credit is not yet on the agenda here.) But since money is not only a general commodity, but *also* a particular, and since, as a particular, it comes under the laws of supply and demand, it follows that the general demand for particular commodities as against money must bring it down.

We see that it is in the nature of money to solve the contradictions of direct barter as well as of exchange value only by positing them as general contradictions. Whether or not a *particular medium of exchange* was exchanged for another particular was a matter of coincidence; now, however, the commodity must be exchanged for the *general medium of exchange,* against which its particularity stands in a still greater contradiction. In order to secure the exchangeability of the commodity, exchangeability itself is set up in opposition to it as an independent commodity. (It was a means, becomes an end.) The question was, whether a particular commodity encounters another particular one. But money suspends the act of exchange itself in two mutually indifferent acts.

(Before the questions regarding circulation, its strength, weakness, etc., and notably the disputed point regarding the quantity of money in circulation and prices, are further developed, money should be looked at from the point of view of its third characteristic. [65])

One moment of circulation is that the commodity exchanges itself through money for another commodity. But there is, equally, the other moment, not only that commodity exchanges for money and money for commodity, but equally that money exchanges for commodity and commodity for money; hence that money is mediated with itself by the commodity, and appears as the unity which joins itself with itself in its circular course. Then it appears no longer as the medium, but as the aim of circulation (as e.g. with the merchant estate) (in commerce generally). If circulation is looked at not as a constant alternation, but as a series of circular motions which it describes within itself, then this circular path appears as a double one: Commodity–Money–Money–Commodity; and in the other direction Money–Commodity–Commodity–Money; i.e. if I sell in order to buy, then I can also buy in order to sell. In the former case money only a means to obtain the commodity, and the commodity the aim; in the second case the commodity only a means to obtain money, and money the aim. This is the simple result when the moments of circulation are brought together. Looking at it as mere circulation, the point at which I intervene in order to declare it the point of departure has to be a matter of indifference.

Now, a specific distinction does enter between a commodity in circulation and money in circulation. The commodity is thrown out of circulation at a certain point and fulfils its definitive function only when it is definitively withdrawn from circulation, consumed, whether in the act of production or in consumption proper. The function of money, by contrast, is to remain in circulation as its vehicle, to resume its circular course always anew like a *perpetuum mobile.*

Nevertheless, this second function is also a part of circulation, equally with the first. Now one can say: to exchange commodity for commodity makes sense, since commodities, although they are equivalent as prices, are qualitatively different, and their exchange ultimately satisfies qualitatively different needs. By contrast, exchanging money for money makes no sense, unless, that is, a quantitative difference arises, less money is exchanged for more, sold at a higher price than purchased, and with the category of profit we have as yet nothing to do. The circle Money–Commodity–Commodity–Money, which we drew from the analysis of circulation, would then appear to be merely an arbitrary and senseless abstraction, roughly as if one wanted to describe the life cycle as Death–Life–Death; although even in the latter case it could not be denied that the constant decomposition of what has been individualized back into the elemental is just as much a moment of the process of nature as the constant individualization of the elemental. Similarly in the act of circulation, the constant monetarization of commodities, just as much as the constant transformation of money into commodities. In the real process of buying in order to sell, admittedly, the motive is the profit made thereby, and the ultimate aim is to exchange less money, by way of the commodity, for more money, since there is no qualitative difference (here we disregard special kinds of metal money as well as special kinds of coins) between money and money. All that given, it cannot be denied that the operation may come to grief and that hence the exchange of money for money without quantitative difference frequently takes place in reality and, hence, can take place. But before this process, on which commerce rests and which therefore, owing to its extension, forms a chief phenomenon of circulation, is possible at all, the circular path Money–Commodity–Commodity–Money must be recognized as a particular form of circulation. This form is specifically different from that in which money appears as a mere medium of exchange for commodities; as the middle term; as a minor premise of the syllogism. Along with its quantitative aspect, visible in commerce, it must be separated out in its purely qualitative form, in its specific movement. *Secondly*: it already implies that money functions neither only as measure, nor only as medium of exchange, nor only as both; but has yet a third quality. It appears here *firstly* as an end in itself, whose sole realization is served by commodity trade and exchange. *Secondly,* since the cycle concludes with it at that point, it steps *outside* it, just as the commodity, having been exchanged for its equivalent through money, is thrown out of circulation. It is very true that money, in so far as it serves only as an agent of circulation, constantly remains enclosed in its cycle. But it appears here, also, that it is still something more than this instrument of circulation, that it also has an independent existence outside circulation, and that in this new character it can be withdrawn from circulation just as the commodity must constantly be definitively withdrawn. We must then observe money in its third quality, in which both of the former are included, i.e. that of serving as measure as well as the general medium of exchange and hence the realization of commodity prices.

(c) Money as material representative of wealth (accumulation of money; before that, money as the general material of contracts, etc.)

It is in the nature of circulation that every point appears simultaneously as a starting-point and as a conclusion, and, more precisely, that it appears to be the one in so far as it appears to be the other. The specific form M–C–C–M therefore just as correct as the other, which appears the more original, C–M–M–C. The difficulty is that the other commodity is qualitatively different; not so the other money. It can differ only quantitatively. – Regarded as *measure* the material substance of money is essential, although its availability and even more its quantity, the *amount* of the portion of gold or silver which serves as *unit*, are entirely irrelevant for it in this quality, and it is employed in general only as an imaginary, non-existent unit. In this quality it is needed as a unit and not as an amount. If I say a pound of cotton is worth 8d., then I am saying that 1 pound of cotton = 1/116 oz. of gold (the ounce at £3 17s. 7d.) (931d.). This expresses at the same time its particularity as exchange value as against all other commodities, as equivalent of all other commodities, which contain the ounce of gold this or that many times, since they are all in the same way compared to the ounce of gold. This original relation of the pound of cotton with gold, by means of which the quantity of gold contained in an ounce of cotton is determined, is fixed by the quantity of labour time realized in one and the other, the real common substance of exchange values. This is to be presupposed from the chapter dealing with exchange value as such. The difficulty of finding this equation is not as great as it may appear. For example, labour which directly produces gold directly reveals a certain quantity of gold to be the product of, say, one working day. Competition equates the other working days with that one, *modificandis modificatis.* Directly or indirectly. In a word, in the direct production of gold, a definite quantity of gold directly appears as product and hence as the value, the equivalent, of a definite amount of labour time. One has therefore only to determine the amount of labour time realized in the various commodities, and to equate them to the labour time which directly produces gold, in order to state how much gold is contained in a given commodity. The determination of all commodities as prices – as measured exchange values – is a process which takes place only gradually, which presupposes frequent exchange and hence frequent comparison of commodities as exchange values; but as soon as the existence of commodities as prices has become a precondition – a precondition which is itself a product of the social process, a result of the process of social production – then the determination of new prices appears simple, since the elements of production cost are themselves already present in the form of prices, and are hence simply to be added. (*Frequent alienation, sale, frequent sale,* Steuart. [66] Rather, all this must have continuity so that prices achieve a certain regularity.) However, the point we wanted to get at here is this: in so far as gold is to be established as the unit of measurement, the relation of gold to commodities is determined by barter, direct, unmediated exchange; like the relation of all other commodities to one another. With barter, however, the product is exchange value only *in itself*; it is its first phenomenal form; but the product is not yet posited as exchange value. Firstly, this character does not yet dominate production as a whole, but concerns only its superfluity and is hence itself more or less *superfluous* (like exchange itself); an accidental enlargement of the sphere of satisfactions, enjoyments (relations to new objects). It therefore takes place at only a few points (originally at the borders of the natural communities, in their contact with strangers), is restricted to a narrow sphere, and forms something which passes production by, is auxiliary to it; dies out just as much by chance as it arises. The form of barter in which the overflow of one's own production is exchanged by chance for that of others' is only the *first occurrence* of the product as exchange value in general, and is determined by accidental needs, whims, etc. But if it should happen to continue, to become a continuing act which contains within itself the means of its renewal, then little by little, from the outside and likewise by chance, regulation of reciprocal exchange arises by means of regulation of reciprocal production, and the costs of production, which ultimately resolve into labour time, would thus become the measure of exchange. This shows how exchange comes about, and the exchange value of the commodity. But the circumstances under which a relation occurs for the first time by no means show us that relation either in its purity or in its totality. A product posited as exchange value is in its essence no longer a simple thing; it is posited in a quality differing from its natural quality; it is posited as a *relation,* more precisely as a relation in general, not to one commodity but to every commodity, to every possible product. It expresses, therefore, a general relation; the product which relates to itself as the realization of a *specific quantity* of labour in general, of social labour time, and is therefore the equivalent of every other product in the proportion expressed in its exchange value. Exchange value presupposes social labour as the substance of all products, quite apart from their natural make-up. Nothing can express a relation without relating to one particular thing, and there can be no general relation unless it relates to a general thing. Since labour is motion, time is its natural measure. Barter in its crudest form presupposes labour as substance and labour time as measure of commodities; this then emerges as soon as it becomes regularized, continuous, as soon as it contains within itself the reciprocal requirements for its renewal. – A commodity is *exchange value* only if it is expressed in another, i.e. as a relation. A bushel of wheat is worth so many bushels of rye; in this case wheat is exchange value in as much as it is expressed in rye, and rye is exchange value in as much as it is expressed in wheat. If each of the two is related only to itself, it is not exchange value. Now, in the relation in which money appears as measure, it itself is not expressed as a relation, not as exchange value, but as a natural quantity of a certain material, a natural weight- fraction of gold or silver. In general, the commodity in which the exchange value of another is expressed, is never expressed as exchange value, never as relation, but rather as a definite quantity of its natural make-up. If 1 bushel of wheat is worth 3 bushels of rye, then only the bushel of wheat is expressed as a value, not the bushel of rye. Of course, the other is also posited *in itself*; the 1 bushel of rye is then = 1/3 bushel of wheat; but this is not *posited,* but merely a second relation, which is admittedly directly present in the first. If one commodity is expressed in another, then it is posited as a relation, and the other as simple quantity of a certain material. 3 bushels of rye are in themselves no value; rather, rye filling up a certain volume, measured by a standard of volume. The same is true of money as measure, as the unit in which the exchange values of other commodities are measured. It is a specific weight of the natural substance by which it is represented, gold, silver, etc. If 1 bushel of wheat has the price of 77s. 7d., then it is expressed as something else, to which it is equal, as 1 ounce of gold; as relation, as exchange value. But 1 ounce of gold is in itself no exchange value; it is not expressed as exchange value; but as a specific quantity of itself, of its natural substance, gold. If 1 bushel of wheat has the price of 77s. 7d. or of 1 ounce of gold, then this can be a greater or lesser value, since 1 ounce of gold will rise or fall in relation to the quantity of labour required for its production. But for the determination of its price as such, this is irrelevant; for its price of 77s. 7d. exactly expresses the relation in which it is equivalent to all other commodities, in which it can buy them. The specificity of price determination, whether the bushel is 77 or 1,780s., is a different matter altogether from the determination of price as such, i.e. the positing of wheat as price. It has a price, regardless of whether it costs 100 or 1s. The price expresses its exchange value only in a unit common to all commodities; presupposes therefore that this exchange value is already regulated by other relations. To be sure, the fact that 1 bushel of wheat has the price of 1 ounce of gold – since gold and wheat as natural objects have no relation with one another, are *as such* not a measure for one another, are *irrelevant* to one another – this fact is found out by bringing the ounce of gold itself into relation with the amount of labour time necessary for its production, and thus bringing both wheat and gold in relation to a third entity, labour, and equating them through this relation; by comparing them both, therefore, as exchange values. But this shows us only how the price of wheat is found, the quantity of gold to which it is equal. In this relation itself, where gold appears as the price of wheat, it is itself not in turn posited as a relation, as exchange value, but as a certain quantity of a natural material. In exchange value, commodities (products) are posited as relations to their social substance, to labour; but as prices, they are expressed as quantities of other products of various natural make-ups. Now, it can admittedly be said that the price of money is also posited as 1 bushel of wheat, 3 bushels of rye and all the other quantities of different commodities, whose price is 1 ounce of gold. But then, in order to express the price of money, the whole sphere of commodities would have to be listed, each in the quantity which equals 1 ounce of gold. Money would then have as many prices as there are commodities whose price it itself expresses. The chief quality of price, *unity,* would disappear. No commodity expresses the price of money, because none expresses its relation to all other commodities, its general exchange value. But it is the specific characteristic of price that exchange value must be expressed in its generality and at the same time in a specific commodity. But even this is irrelevant. In so far as money appears as a material in which the price of all commodities is expressed and measured, to that extent is money itself posited as a particular amount of gold, silver, etc., in short, of its natural matter; a simple amount of a certain material, not itself as exchange value, as relation. In the same way, every commodity which expresses the price of another is itself not *posited* as exchange value, but as a simple amount of itself. In its quality as unit of exchange value, as their measure, their common point of comparison, money is essentially a natural material, gold, silver; since, as the price of the commodity, it is not an exchange value, not a relation, but a certain weight of gold, silver; e.g. a pound with its subdivisions, and thus money appears originally as pound, *aes grave.* This is precisely what distinguishes price from exchange value, and we have seen that exchange value necessarily drives towards price formation. Hence the nonsensicality of those who want to make labour time as such into money, i.e. who want to posit and then not posit the distinction between price and exchange value. Money as measure, as element of price determination, as measuring unit of exchange values thus presents the following phenomena: (1) it is required only as an imagined unit once the exchange value of an ounce of gold compared to any one commodity has been determined; its actual presence is superfluous, along with, even more so, its available quantity: as an indicator (an indicator of value) the amount in which it exists in a country is irrelevant; required only as accounting unit; (2) while it thus only needs to be posited ideally, and, indeed, in the form of the price of a commodity is only ideally posited *in* it; at the same time, as a simple amount of the natural substance in which it is represented, as a given weight of gold, silver, etc. which is accepted as unit, it also yields the point of comparison, the unit, the measure. Exchange values (commodities) are transformed by the mind into certain weights of gold or silver, and are ideally posited as being = to this imagined quantity of gold etc.; as expressing it.

But when we now go over to the second quality of money, money as medium of exchange and realizer of prices, then we have found that in this case it must be present in a certain *quantity*; that the given weight of gold and silver which has been posited as a unit is required in a given quantity in order to be adequate to this function. If the sum of prices to be realized, which depends on the price of a particular commodity multiplied by its quantity, is given on one side, and the velocity of monetary circulation on the other, then a certain quantity of the circulating medium is required. When we now examine the original form more closely, the direct form in which circulation presents itself, C–M–M–C, then we see that money appears here as a pure medium of exchange. The commodity is exchanged for a commodity, and money appears merely as the medium of this exchange. The price of the first commodity is realized with money, in order to realize the price of the second commodity with the money, and thus to obtain it in exchange for the first. After the price of the first commodity is realized, the aim of the person who now has its price in money is not to obtain the price of the second commodity, but rather to pay its price in order to obtain the commodity. At bottom, therefore, money served him to exchange the first commodity for the second. As mere medium of exchange, money has no other purpose. The man who has sold his commodity and got money wants to buy another commodity, and the man from whom he buys it needs the money in order to buy another commodity etc. Now, in this function, as pure medium of circulation, the specific role of money consists only of this circulation, which it brings about owing to the fact that its quantity, its amount, was fixed beforehand. The number of times in which it is itself contained in the commodities as a unit is determined beforehand by their prices, and as medium of circulation it appears merely as a multiple of this predetermined unit. In so far as it realizes the price of commodities, the commodity is exchanged for its real equivalent in gold and silver; its exchange value is really exchanged for another commodity, money; but in so far as this process takes place only in order to transform this money back into a commodity, i.e. in order to exchange the first commodity for the second, then money appears only fleetingly, or, its substance consists only in this constant appearance as disappearance, as this vehicle of mediation. Money as medium of circulation is *only* medium of circulation. The only attribute which is essential to it in order to serve in this capacity is the attribute of quantity, of amount, in which it circulates. (Since the amount is co-determined by the velocity, the latter does not require special mention here.) In so far as it realizes the price, its material existence as gold and silver is essential; but in so far as this realization is only fleeting and destined to suspend itself, this is *irrelevant*. It is only a *semblance*, as if the point were to exchange the commodity for gold or silver as particular commodities: a semblance which disappears as soon as the process is ended, as soon as gold and silver have again been exchanged for a commodity, and the commodity, hence, exchanged for another. The character of gold and silver as mere media of circulation, or the character of the medium of circulation as gold and silver is therefore irrelevant to their make-up as particular natural commodities. Suppose the total price of circulating commodities = 1,200 thalers. Their measure is then 1 thaler = *x* weight of silver. Now let 100 thalers be necessary to circulate these commodities in 6 hours; i.e. every thaler pays the price of 100 thalers in 6 hours. Now, what is essential is that 100 thalers be present, the amount of 100 of the metallic unit which measures the sum total of commodity prices; 100 of these units. That these units consist of silver is irrelevant to the process itself. This is already visible in the fact that a single thaler represents in the cycle of circulation a mass of silver 100 times greater than is contained in it in reality, even though in each particular transaction it only represents the silver weight of 1 thaler. In circulation as a whole, the 1 thaler thus represents 100 thalers, a weight of silver a hundred times greater than it really contains. It is in truth only a *symbol* for the weight of silver contained in 100 thalers. It realizes a price which is 100 times greater than it realizes in reality as a quantity of silver. Let the pound sterling be = 1/3 ounce of gold (it is not as much as that). In so far as the price of a commodity at £1 is paid, i.e. its price of £1 is realized, it is exchanged for £1, to that extent it is of decisive importance that the £1 really contain 1/3 ounce of gold. If it were a counterfeit £, alloyed with non-precious metals, a £ only in appearance, then indeed the price of the commodity would not be realized; in order to realize it, it would have to be paid for in as great a quantity of the non-precious metal as equals 1/3 of an ounce of gold. Looking at this moment of circulation in isolation, it is thus essential that the unit of money should really represent a given quantity of gold or silver. But when we take circulation as a totality, as a self-enclosed process, C–M–M–C, then the matter stands differently. In the first case the realization of price would be only apparent: in reality only a *part* of its price would be realized. The price posited in it ideally would not be posited in reality. The commodity which is ideally equated to a given weight of gold would in actual exchange not bring in as much gold as that. But if a fake £ were to circulate in the place of a real one, it would render absolutely the same service in circulation as a whole as if it were genuine. If a commodity, A, with the price of £1, is exchanged for 1 fake £, and if this fake pound is again exchanged for commodity B, price £1, then the fake pound has done absolutely the same service as if it had been genuine. The genuine pound is, therefore, in this process, nothing more than a *symbol*, in so far as the moment in which it realizes prices is left out, and we look only at the totality of the process, in which it serves only as medium of exchange and in which the realization of prices is only a *semblance,* a fleeting mediation. Here the gold pound serves only to allow commodity A to be exchanged for commodity B, both having the same price. The real realization of the price of commodity A is, here, the commodity B, and the real realization of the price of B is the commodity A or C or D, which amounts to the same as far as the form of the relation is concerned, for which the particular content of the commodity is entirely irrelevant. Commodities with identical prices are exchanged. Instead of exchanging commodity A directly for commodity B, the price of commodity A is exchanged for the price of commodity B and the price of commodity B for commodity A. Money thus represents to the commodity only the latter’s price. Commodities are exchanged for one another at their prices. The price of the commodity expresses about it, ideally, that it is an amount of a certain natural unit (weight units) of gold or silver, of the material in which money is embodied. In the form of money, or its realized price, the commodity now confronts a real amount of this unit. But in so far as the realization of the price is not the final act, and the point is not to possess the price of commodities as price, but as the price of another commodity, to that extent the material of money is irrelevant, e.g. gold and silver. Money becomes a subject as instrument of circulation, as medium of exchange, and the natural material in which it presents itself appears as an accident whose significance disappears in the act of exchange itself; because it is not in this material that the commodity exchanged for money is supposed to be realized, but rather in the material of another commodity. For now, apart from the moments that, in circulation, (1) money realizes prices, (2) money circulates titles of ownership; we have (3), additionally, that by means of it something takes place which could not happen otherwise, namely that the exchange value of the commodity is expressed in every other commodity. If 1 yard of linen costs 2s. and 1 lb. of sugar 1s., then the yard of linen is realized, by means of the 2s., in 2 lb. of sugar, while the sugar is converted into the material of its exchange value, into the material in which its exchange value is realized. As a mere medium of circulation, in its role in the constant flow of the circulatory process, money is neither the measure of prices, because it is already posited as such in the prices themselves; nor is it the means for the realization of prices, for it exists as such in one single moment of circulation, but disappears as such in the totality of its moments; but is, rather, the mere *representative* of the price in relation to all other commodities, and serves only as a means to the end that all commodities are to be exchanged at equivalent prices. It is exchanged for one commodity because it is the general representative of its exchange value; and, as such, as the *representative* of every other commodity of equal exchange value, it is the general representative; and that is, as such, what it is in circulation itself. It *represents* the price of the one commodity as against all other commodities, or the price of all commodities as against the one commodity. In this relation it is not only the *representative* of commodity prices, but the *symbol* of itself; i.e. in the act of circulation itself, its material, gold and silver, is irrelevant. It *is* the price; it is a given quantity of gold or silver; but in so far as this reality of the price is here only fleeting, a reality destined constantly to disappear, to be suspended, not to count as a definitive realization, but always only as an intermediate, mediating realization; in so far as the point here is not the realization of the price at all, but rather the realization of the exchange value of one particular commodity in the material of another commodity, to that extent its own material is irrelevant; it is ephemeral as a realization of the price, since this itself disappears; it exists, therefore, in so far as it remains in this constant movement, only as a representative of exchange value, which becomes real only if the real exchange value constantly steps into the place of its representative, constantly changes places with it, constantly exchanges itself for it. Hence, in this process, its reality is not that it is the price, but that it *represents* it, is its representative – the materially present representative of the price, thus of itself, and, as such, of the exchange value of commodities. As medium of exchange, it realizes the prices of commodities only in order to posit the exchange value of the one commodity in the other, as its unit; i.e. in order to realize its exchange value in the other commodity; i.e. to posit the other commodity as the material of its exchange value.

Only within circulation, then, is it such a material symbol; taken out of circulation, it again becomes a realized price; but within the process, as we have seen, the quantity, the amount of these material symbols of the monetary unit is the essential attribute. Hence, while the material substance of money, its material substratum of a given quantity of gold or silver, is irrelevant within circulation, where money appears as something existing in opposition to commodities, and where, by contrast, its amount is the essential aspect, since it is there only a *symbol* for a given amount of this unit; in its role as measure, however, where it was introduced only ideally, its material substratum was essential, but its quantity and even its existence as such were irrelevant. From this it follows that money as gold and silver, in so far as *only* its role as means of exchange and circulation is concerned, can be replaced by any other *symbol* which expresses a given quantity of its unit, and that in this way symbolic money can replace the real, because material money as mere medium of exchange is itself symbolic.

It is these contradictory functions of money, as measure, as realization of prices and as mere medium of exchange, which explain the otherwise inexplicable phenomenon that the *debasement* of metallic money, of gold, silver, through admixture of inferior metals, causes a depreciation of money and a rise in prices; because in this case the measure of prices [is] no longer the cost of production of the ounce of gold, say, but rather of an ounce consisting of 2/3 copper etc. (The debasement of the coinage, in so far as it consists merely of falsifying or changing the names of the fractional weight units of the precious metal, e.g. if the eighth part of an ounce were to be called a sovereign, makes absolutely no difference in the measure and changes only its name. If, earlier, 1/4 of the ounce was called 1 sovereign, and now it is 1/8, then the price of 1 sovereign now expresses merely 1/8 of an ounce of gold; thus (about) 2 sovereigns are necessary to express the same price which was earlier expressed by 1 sovereign); or in the case of a mere falsification of the name of the fractional parts of the precious metal, the measure remains the same, but the fractional part [is] expressed in twice as many francs etc. as before; on the other hand, if the substratum of money, gold, silver, is entirely suspended and replaced by paper bearing the symbol of given quantities of real money, in the quantity required by circulation, then the paper circulates at the full gold and silver value. In the first case, because the medium of circulation is at the same time the material of money as measure, and the material in which prices are definitively realized; in the second case, because money only in its role as medium of circulation.

Example of the clumsy confusion between the contradictory functions of money: ‘Price is exactly determined by the quantity of money there is to buy it with. All the commodities in the world can fetch no more than all the money in the world.’ First, the determination of prices has nothing to do with actual sale; money, in sale, serves only as measure. Secondly, all commodities (in circulation) can fetch a thousand times more money as is in the world, if every piece of money were to circulate a thousand times. (The passage is quoted from the *London Weekly Dispatch,* 8 November 1857.)

Since the total sum of prices to be realized in circulation changes with the prices of the commodities and with the quantity of them thrown into circulation; and since, on the other side, the velocity of the medium of circulation is determined by circumstances independent of itself, it follows from this that the quantity of media of circulation must be capable of changing, or expanding and contracting – *contraction and expansion of circulation.*

In its role as mere medium of circulation, it can be said about money that it ceases to be a commodity (*particular* commodity), when its material is irrelevant and it meets only the needs of circulation itself, and no other direct need: gold and silver cease to be commodities as soon as they circulate as money. It can be said about it, on the other hand, that it is now *merely* a commodity (*general* commodity), the commodity in its pure form, indifferent to its natural particularity and hence indifferent to all direct needs, without natural relation to a particular need as such. The followers of the Monetary System, even partly of the protectionist system (see e.g. Ferrier, p. 2), [67] have clung only to the first aspect, while the modern economists cling to the second; e.g. Say, who says that money should be treated like a ‘particular’ commodity, a commodity like any other. [68] As medium of exchange, money appears in the role of necessary mediator between production and consumption. In the developed money system, one produces only in order to exchange, or, one produces only by exchanging. Strike out money, and one would thereby either be thrown back to a lower stage of production (corresponding to that of auxiliary barter), or one would proceed to a higher stage, in which exchange value would no longer be the principal aspect of the commodity, because social labour, whose representative it is, would no longer appear merely as socially mediated private labour.

The question whether money as medium of exchange is productive or not productive is solved just as easily. According to Adam Smith, money not productive. [69] Of course, Ferrier says e.g.: ‘It creates values, because they would not exist without it.’ One has to look not only at ‘its *value* as metal, but equally its *property* as money’. A. Smith is correct, in so far as it is not the instrument of any particular branch of production; Ferrier is right too because it is an essential aspect of the mode of production resting on exchange value that product and agency of production should be posited in the character of money, and because this characteristic presupposes a money distinct from products; and because the money relation is itself a relation of production if production is looked at in its totality.

When C–M–M–C is dissected into its two moments, although the *prices* of the commodities are presupposed (and this makes the major difference), circulation splits into two acts of direct barter.

C–M: the exchange value of the commodity is expressed in another particular commodity, in the material of money, like that of money in the commodity; similarly with M–C. To this extent, A. Smith is right when he says that money as medium of exchange is only a more complicated kind of barter. But when we look at the whole of the process, and not at both as equivalent acts, realization of the commodity in money and of money in the commodity, then A. Smith’s opponents are correct when they say that he misunderstood the nature of money and that monetary circulation suppresses barter; that money serves only to balance the accounts of the ‘arithmetical division’ arising from the division of labour. These ‘arithmetical figures’ no more need to be of gold and silver than do the measures of length. (See Solly, p. 20.) [70]

Commodities change from being *marchandises* to being *denrées*, they enter consumption; money as medium of circulation does not; at no point does it cease to be commodity, *as long as* it remains within the role of medium of circulation.

We now pass on to the third function of money; which initially results from the second form of circulation:

M–C–C–M; in which money appears not only as *medium,* nor as *measure,* but as end-in-itself, and hence steps outside circulation just like a particular commodity which ceases to circulate for the time being and changes from *marchandise* to *denrée.*

But first it must be noted that, once the quality of money as an intrinsic relation of production generally founded on exchange value is presupposed, it is possible to demonstrate that in some particular cases it does service as an instrument of production. 'The utility of gold and silver rests on this, that they replace labour.' (Lauderdale, p. 11.) [71] Without money, a mass of swaps would be necessary before one obtained the desired article in exchange. Furthermore, in each particular exchange one would have to undertake an investigation into the relative value of commodities. Money spares us the first task in its role as instrument of exchange (instrument of commerce); the second task, as measure of value and representative of all commodities (idem, loc. cit.). The opposite assertion, that money is not productive, amounts only to saying that, apart from the functions in which it is productive, as measure, instrument of circulation and representative of value, it is *unproductive*; that its quantity is productive only in so far as it is necessary to fulfil these preconditions. That it becomes not only *unproductive*, but *faux frais de production*, the moment when more of it is employed than necessary for its productive aspect – this is a truth which holds for every other instrument of production or exchange; for the machine as well as the means of transportation. But if by this it is meant that money exchanges only real wealth which already exists, then this is false, since labour, as well, is exchanged for it and bought with it, i.e. productive activity itself, *potential* wealth.

The *third attribute* of money, in its complete development, presupposes the first two and constitutes their unity. Money, then, has an independent existence outside circulation; it has stepped outside it. As a *particular* commodity it can be transformed out of its form of money into that of luxury articles, gold and silver jewellery (as long as craftsmanship is still very simple, as e.g. in the old English period, a constant transformation of silver money into plate and vice versa. See Taylor) [72] ; or, as money, it can be *accumulated* to form a *treasure*. When money in its independent existence is derived from circulation, it appears in itself as a result of circulation; by way of circulation, it closes the circle with itself. This aspect already latently contains its quality as *capital*. It is negated only as medium of exchange. Still, since it can be historically posited as measure before it appears as medium of exchange, and can appear as medium of exchange before it is posited as measure – in the latter case it would exist merely as preferred *commodity* – it can therefore also appear historically in the third function before it is posited in the two prior ones. But gold and silver can be accumulated *as money* only if they are already present in one of the other two roles, and it can appear in a developed form of the third role only if the two earlier ones are already developed. Otherwise, accumulating it is nothing more than the accumulation of gold and silver, not of money.

(As an especially interesting example, go into the *accumulation of copper money* in the earlier periods of the Roman republic.)

Since money as *universal material representative of wealth* emerges from circulation, and is as such itself a *product of circulation*, both of exchange at a higher potentiality, and a *particular* form of exchange, it stands therefore in the third function, as well, in connection with circulation; it stands independent of circulation, but this independence is only its own process. It derives from it just as it returns to it again. Cut off from all relation to it, it would not be money, but merely a simple natural object, gold or silver. In this character it is just as much its precondition as its result. Its independence is not the end of all relatedness to circulation, but rather a *negative* relation to it. This comes from its independence as a result of M–C–C–M. In the case of money as *capital,* money itself is posited (1) as precondition of circulation as well as its result; (2) as having independence only in the form of a negative relation, but always a relation to circulation; (3) as itself an *instrument of production,* since circulation no longer appears in its primitive simplicity, as quantitative exchange, but as a process of production, as a real metabolism. And thus money is itself stamped as a particular moment of this process of production. Production is not only concerned with simple determination of prices, i.e. with translation of the exchange values of commodities into a common unit, but with the creation of exchange values, hence also with the creation of the *particularity* of prices. Not merely with positing the form, but also the content. Therefore, while in simple circulation, money appears generally as productive, since circulation in general is itself a moment of the system of production, nevertheless this quality still only exists *for us,* and is not yet *posited* in money. (4) As capital, money thus also appears posited as a relation to itself mediated by circulation – in the *relation* of *interest and capital.* But here we are not as yet concerned with these aspects; rather, we have to look simply at money in the third role, in the form in which it emerged as something *independent* from circulation, more properly, from both its earlier aspects.

(‘An increase of money only an increase in the *means of counting.*’ Sismondi. [73] This correct only in so far as defined as mere medium of exchange. In the other property it is also an increase in the *means of paying.*)

‘Commerce separated the shadow from the body, and introduced the possibility of owning them separately.’ (Sismondi.) [74] Thus, money is now exchange value become independent (it never puts in more than a fleeting appearance as such, as *medium of exchange*) in its general form. It possesses, it is true, a particular body or substance, gold and silver, and precisely this gives it its independence; for what only exists as an aspect or relation of something else is not independent. On the other side, with this bodily independence, as gold and silver, it represents not only the exchange value of one commodity as against another, but rather exchange value as against all commodities; and although it possesses a substance of its own, it appears at the same time, in its particular existence as gold and silver, as the general exchange value of all commodities. On one side, it is possessed as their exchange value; they stand on the other side as only so many particular substances of exchange value, so that it can either transform itself into every one of these substances through exchange, or it can remain indifferent to them, aloof from their particularity and peculiarity. They are therefore merely accidental existences. It is the *‘précis de toutes les choses’,* [75] in which their particular character is erased; it is general wealth in the form of a concise compendium, as opposed to its diffusion and fragmentation in the world of commodities. While wealth in the form of the particular commodity appears as one of the moments of the same, or the commodity as one of the moments of wealth; in the form of gold and silver general wealth itself appears as concentrated in a particular substance. Every particular commodity, in so far as it is exchange value, has a price, expresses a certain quantity of money in a merely imperfect form, since it has to be thrown into circulation in order to be realized, and since it remains a matter of chance, due to its particularity, whether or not it is realized. However, in so far as it is realized not as price, but in its natural property, it is a moment of wealth by way of its relation to a particular need which it satisfies; and, in this relation, [it] expresses (1) only the wealth of uses [*Gebrauchsreichtum*], (2) only a quite particular facet of this wealth. Money, by contrast, apart from its particular usefulness as a valuable commodity, is (1) the realized price; (2) satisfies every need, in so far as it can be exchanged for the desired object of every need, regardless of any particularity. The commodity possesses this property only through the mediation of money. Money possesses it directly in relation to all commodities, hence in relation to the whole world of wealth, to wealth as such. With money, general wealth is not only a form, but at the same time the content itself. The concept of wealth, so to speak, is realized, *individualized* in a particular object.

NOTEBOOK II

c. November 1857

The Chapter on Money (continuation)

(*Superfluity, accumulation*)

In the particular commodity, in so far as it is a price, wealth is posited only as an ideal form, not yet realized; and in so far as it has a particular use value, it represents merely a quite singular facet of wealth. In money, by contrast, the price is realized; and its substance is wealth itself considered in its totality in abstraction from its particular modes of existence. Exchange value forms the substance of money, and exchange value is wealth. Money is therefore, on another side, also the embodied form of wealth, in contrast to all the substances of which wealth consists. Thus, while on one side the form and the content of wealth are identical in money, considered for itself, on the other side, in contrast to all the other commodities, money is the general form of wealth, while the totality of these particularities form its substance. Thus, in the first role, money is wealth itself; in the other, it is the *general material representative of wealth.* This totality exists in money itself as the comprehensive representation of commodities. Thus, wealth (exchange value as totality as well as abstraction) exists, individualized as such, to the exclusion of all other commodities, as a singular, tangible object, in gold and silver. Money is therefore the god among commodities.

Since it is an individuated, tangible object, money may be randomly searched for, found, stolen, discovered; and thus general wealth may be tangibly brought into the possession of a particular individual. From its servile role, in which it appears as mere medium of circulation it suddenly changes into the lord and god of the world of commodities. It represents the divine existence of commodities, while they represent its earthly form. Before it is replaced by exchange value, every form of natural wealth presupposes an essential relation between the individual and the objects, in which the individual in one of his aspects objectifies [*vergegenständlicht*] himself in the thing, so that his possession of the thing appears at the same time as a certain development of his individuality: wealth in sheep, the development of the individual as shepherd, wealth in grain his development as agriculturist, etc. *Money, however, as the individual* of general wealth, as something emerging from circulation and representing a general quality, as a *merely social result,* does not at all presuppose an individual relation to its owner; possession of it is not the development of any particular essential aspect of his individuality; but rather possession of what lacks individuality, since this social [relation] exists at the same time as a sensuous, external object which can be mechanically seized, and lost in the same manner. Its relation to the individual thus appears as a purely accidental one; while this relation to a thing having no connection with his individuality gives him, at the same time, by virtue of the thing's character, a general power over society, over the whole world of gratifications, labours, etc. It is exactly as if, for example, the chance discovery of a stone gave me mastery over all the sciences, regardless of my individuality. The possession of money places me in exactly the same relationship towards wealth (social) as the philosophers' stone would towards the sciences.

Money is therefore not only *an* object, but is *the* object of greed [*Bereicherungssucht*]. It is essentially *auri sacra fames.* [1] Greed as such, as a particular form of the drive, i.e. as distinct from the craving for a particular kind of wealth, e.g. for clothes, weapons, jewels, women, wine etc., is possible only when general wealth, wealth as such, has become individualized in a particular thing, i.e. as soon as money is posited in its third quality. Money is therefore not only the object but also the fountainhead of greed. The mania for possessions is possible without money; but greed itself is the product of a definite social development, not *natural,* as opposed to *historical.* Hence the wailing of the ancients about money as the source of all evil. Hedonism [*Genusssucht*] in its general form and miserliness [*Geiz*] are the two particular forms of monetary greed. Hedonism in the abstract presupposes an object which possesses all pleasures in potentiality. Abstract hedonism realizes that function of money in which it is the *material representative of wealth*; miserliness, in so far as it is only the general form of wealth as against its particular substances, the commodities. In order to maintain it as such, it must sacrifice all relationship to the objects of particular needs, must abstain, in order to satisfy the need of greed for money as such. Monetary greed, or mania for wealth, necessarily brings with it the decline and fall of the ancient communities [*Gemeinwesen*]. Hence it is the antithesis to them. It is itself the community [*Gemeinwesen*], [2] and can tolerate none other standing above it.

But this presupposes the full development of exchange values, hence a corresponding organization of society. In antiquity, exchange value was not the *nexus rerum;* it appears as such only among the mercantile peoples, who had, however, no more than a carrying trade and did not, themselves, produce. At least this was the case with the Phoenicians, Carthaginians, etc. But this is a peripheral matter. They could live just as well in the interstices of the ancient world, as the Jews in Poland or in the Middle Ages. Rather, this world itself was the precondition for such trading peoples. That is why they fall apart every time they come into serious conflict with the ancient communities. Only with the Romans, Greeks etc. does money appear unhampered in both of its first two functions, as measure and as medium of circulation, and not very far developed in either. But as soon as either their trade etc. develops, or, as in the case of the Romans, conquest brings them money in vast quantities – in short, suddenly, and at a certain stage of their economic development, money necessarily appears in its third role, and the further it develops in that role, the more the decay of their community advances. In order to function productively, money in its third role, as we have seen, must be not only the precondition but equally the result of circulation, and, as its precondition, also a moment of it, something posited by it. Among the Romans, who amassed money by stealing it from the whole world, this was not the case. It is inherent in the simple character of money itself that it can exist as a developed moment of production only where and when *wage labour* exists; that in this case, far from subverting the social formation, it is rather a condition for its development and a driving-wheel for the development of all forces of production, material and mental. A particular individual may even today come into money by chance, and the possession of this money can undermine him just as it undermined the communities of antiquity. But the dissolution of this individual within modern society is in itself only the enrichment of the productive section of society. The owner of money, in the ancient sense, is dissolved by the industrial process, which he serves whether he wants and knows it or not. It is a dissolution which affects only his person. *As material representative of general wealth,* as *individualized exchange value,* money must be the *direct* object, aim and product of general labour, the labour of all individuals. Labour must directly produce exchange value, i.e. money. It must therefore be *wage labour.* Greed, as the urge of all, in so far as everyone wants to make money, is only created by general wealth. Only in this way can the general mania for money become the wellspring of general, self-reproducing wealth. When labour is wage labour, and its direct aim is money, then general wealth is *posited* as its aim and object. (*In this regard, talk about the context of the military system of antiquity when it became a mercenary system.*) Money as aim here becomes the means of general industriousness. General wealth is produced in order to seize hold of its representative. In this way the real sources of wealth are opened up. When the aim of labour is not a particular product standing in a particular relation to the particular needs of the individual, but money, wealth in its general form, then, firstly the individual's industriousness knows no bounds; it is indifferent to its particularity, and takes on every form which serves the purpose; it is ingenious in the creation of new objects for a social need, etc. It is clear, therefore, that when wage labour is the foundation, money does not have a dissolving effect, but acts productively; whereas the ancient community as such is already in contradiction with wage labour as the general foundation. General industriousness is possible only where every act of labour produces general wealth, not a particular form of it; where therefore the individual's reward, too, is money. Otherwise, only particular forms of industry are possible. Exchange value as direct product of labour is money as direct product of labour. Direct labour which produces exchange value as such is therefore wage labour. Where money is not itself the community [*Gemeinwesen*], it must dissolve the community. In antiquity, one could buy labour, a slave, directly; but the slave could not buy money with his labour. The increase of money could make slaves more expensive, but could not make their labour more productive. *Negro slavery* – a purely industrial slavery – which is, besides, incompatible with the development of bourgeois society and disappears with it, *presupposes* wage labour, and if other, free states with wage labour did not exist alongside it, if, instead, the Negro states were isolated, then all social conditions there would immediately turn into pre-civilized forms.

Money as individualized exchange value and hence as wealth incarnate was what the alchemists sought; it figures in this role within the Monetary (Mercantilist) System. The period which precedes the development of modern industrial society opens with general greed for money on the part of individuals as well as of states. The real development of the sources of wealth takes place as it were behind their backs, as a means of gaining possession of the representatives of wealth. Wherever it does not arise out of circulation – as in Spain – but has to be discovered physically, the nation is impoverished, whereas the nations which have to work in order to get it from the Spaniards develop the sources of wealth and really become rich. This is why the search for and discovery of gold in new continents, countries, plays so great a role in the history of revaluation, because by its means colonization is improvised and made to flourish as if in a hothouse. The hunt for gold in all countries leads to its discovery; to the formation of new states; initially to the spread of commodities, which produce new needs, and draw distant continents into the metabolism of circulation, i.e. exchange. Thus, in this respect, as the general representative of wealth and as individualized exchange value, it was doubly a means for expanding the universality of wealth, and for drawing the dimensions of exchange over the whole world; for creating the true *generality* [*Allgemeinheit*] of exchange value in substance and in extension. But it is inherent in the attribute in which it here becomes developed that the illusion about its nature, i.e. the fixed insistence on one of its aspects, in the abstract, and the blindness towards the contradictions contained within it, gives it a really magical significance behind the backs of individuals. In fact, it is because of this self-contradictory and hence illusory aspect, because of this abstraction, that it becomes such an enormous instrument in the real development of the forces of social production.

It is the elementary precondition of bourgeois society that labour should directly produce exchange value, i.e. money; and, similarly, that money should directly purchase labour, and therefore the labourer, but only in so far as he alienates [*veräussert*] his activity in the exchange. *Wage labour* on one side, *capital* on the other, are therefore only other forms of developed exchange value and of money (as the incarnation of exchange value). Money thereby directly and simultaneously becomes the *real community* [*Gemeinwesen*], since it is the general substance of survival for all, and at the same time the social product of all. But as we have seen, in money the community [*Gemeinwesen*] is at the same time a mere abstraction, a mere external, accidental thing for the individual, and at the same time merely a means for his satisfaction as an isolated individual. The community of antiquity presupposes a quite different relation to, and on the part of, the individual. The development of money in its third role therefore smashes this community. All production is an objectification [*Vergegenständlichung*] of the individual. In money (exchange value), however, the individual is not objectified in his natural quality, but in a social quality (relation) which is, at the same time, external to him.

Money *posited* in the form of the medium of circulation is *coin* [*Münze*]. As coin, it has lost its use value as such; its use value is identical with its quality as medium of circulation. For example, it has to be melted down before it can serve as money as such. It has to be demonetized. That is why the coin is also only a *symbol* whose material is irrelevant. But, as coin, it also loses its universal character, and adopts a national, local one. It decomposes into coin of different kinds, according to the material of which it consists, gold, copper, silver, etc. It acquires a political title, and talks, as it were, a different language in different countries. Finally, within a single country it acquires different denominations, etc. Money in its third quality, as something which *autonomously* arises out of and stands against circulation, therefore still negates its character as coin. It reappears as gold and silver, whether it is melted down or whether it is valued only according to its gold and silver weight-content. It also loses its national character again, and serves as medium of exchange between the nations, as universal medium of exchange, no longer as a symbol, but rather as a definite amount of gold and silver. In the most developed international system of exchange, therefore, gold and silver reappear in exactly the same form in which they already played a role in primitive barter. Gold and silver, like exchange itself originally, appear, as already noted, not within the sphere of a social community, but where it ends, on its boundary; on the few points of its contact with alien communities. Gold (or silver) now appears posited as the *commodity* as such, the universal commodity, which obtains its character as commodity in all places. Only in this way is it the material representative of *general* wealth. In the Mercantilist System, therefore, gold and silver count as the measure of the power of the different communities. 'As soon as the precious metals become objects of commerce, an universal equivalent for everything, they also become the measure of power between nations. Hence the Mercantilist System.' (Steuart.) [3] No matter how much the modern economists imagine themselves beyond Mercantilism, in periods of general crisis gold and silver still appear in precisely this role, in 1857 as much as in 1600. In this character, gold and silver play an important role in the creation of the world market. Thus the circulation of American silver from the West to the East; the metallic band between America and Europe on one side, with Asia on the other side, since the beginning of the modern epoch. With the original communities this trade in gold and silver was only a peripheral concern, connected with excess production, like exchange as a whole. But in developed trade it is posited as a moment essentially interconnected with production etc. as a whole. It no longer appears for the purpose of exchanging the excess production but to balance it out as part of the total process of international commodity exchange. It is coin, now, only as *world coin.* But, as such, its formal character as medium of circulation is essentially irrelevant, while its material is everything. As a form, in this function, gold and silver remain the universally acceptable *commodity,* the commodity as such.

(In this first section, where exchange values, money, prices are looked at, commodities always appear as already present. The determination of forms is simple. We know that they express aspects of social production, but the latter itself is the precondition. However, they are *not posited* in this character [of being aspects of social production]. And thus, in fact, the first exchange appears as exchange of the superfluous only, and it does not seize hold of and determine the whole of production. It is the *available* overflow of an overall production which lies outside the world of exchange values. This still presents itself even on the surface of developed society as the directly available world of commodities. But by itself, it points beyond itself towards the economic relations which are posited as *relations of production.* The internal structure of production therefore forms the second section; the concentration of the whole in the state the third; the international relation the fourth; the world market the conclusion, in which production is posited as a totality together with all its moments, but within which, at the same time, all contradictions come into play. The world market then, again, forms the presupposition of the whole as well as its substratum. Crises are then the general intimation which points beyond the presupposition, and the urge which drives towards the adoption of a new historic form.) ‘The quantity of goods and the quantity of money may remain the same, and price may rise or fall notwithstanding’ (namely through greater expenditure, e.g. by the moneyed capitalists, landowners, state officials etc. Malthus, X, 43). [4]

Money, as we have seen, in the form in which it independently steps outside of and against circulation, is the negation (negative unity) of its character as medium of circulation and measure. * We have developed, so far:

> * In so far as money is a medium of circulation, ‘the quantity of it which circulates can never be employed individually; it must always circulate’. (Storch.) The individual can employ money only by divesting himself of it, by positing it as *being for others,* in its social function. This, as Storch correctly remarks, is a reason why the material of money ‘should not be indispensable to human existence’, in the manner of such things as hides, salt, etc., which serve for money among some peoples. For the quantity that is in circulation is lost to consumption. Hence, firstly, metals [enjoy] preference over other commodities as money, and secondly, the precious metals preference over those which useful as instruments of production. It is characteristic of the economists that Storch expresses this thusly: the material of money should should ‘have direct value but on the basis of an *artificial need*‘. Artificial need is what the economist calls, firstly, the needs which arise out of the *social* existence of the individual; secondly, those which do not flow from its naked existence as a natural object. This shows the inner, desperate poverty which forms the basis of bourgeois wealth and of its science.

Firstly. Money is the negation of the medium of circulation as such, of the *coin.* But it also contains the latter at the same time as an aspect, negatively, since it can always be transformed into coin; positively, as *world coin,* but, as such, its formal character is irrelevant, and it is essentially a commodity as such, the omnipresent commodity, not determined by location. This indifference is expressed in a double way: *Firstly because* it is now money only as gold and as silver, not as *symbol,* not in the form of the coin. For that reason the *face* which the state impresses on money as coin has no value; only its metal content has value. Even in domestic commerce it has a merely temporary, local value, ‘because it is no more useful to him who owns it than to him who owns the commodity to be bought’. The more domestic commerce is conditioned on all sides by foreign commerce, the more, therefore, does the value of this face vanish: it does not exist in private exchange, but appears only as tax. *Then:* in their capacity as *general* commodity, as world coin, the return of gold and silver to their point of departure, and, more generally, circulation as such, are not necessary. *Example:* Asia and Europe. Hence the wailings of the upholders of the Monetary System, that money disappears among the heathen without flowing back again. (See Misselden about 1600.) [5] The more external circulation is conditioned and enveloped by internal, the more does the world coin as such come into circulation (rotation). This higher stage is yet no concern of ours and is not contained in the simple relation which we are considering here.

Secondly: Money is the negation of itself as mere realization of the prices of commodities, where the particular commodity always remains what is essential. It becomes, rather, the price realized in itself and, as such, the *material representative of wealth* as well as the *general form of wealth* in relation to all commodities, as merely particular substances of it; but

Thirdly: Money is also negated in the aspect in which it is merely the *measure* of exchange values. As the general form of wealth and as its material representative, it is no longer the ideal measure of other things, of exchange values. For it is itself the adequate [*adäquat*] reality of exchange value, and this it is in its metallic being. Here the character of measure has to be posited in it. It is its own unit; and the measure of its value, the measure of itself as wealth, as exchange value, is the quantity of itself which it represents. The multiple of an amount of itself which serves as unit. As measure, its amount was irrelevant; as medium of circulation, its materiality, the matter of the unit, was irrelevant: as money in this third role, the amount of itself as of a definite quantity of material is essential. If its quality as general wealth is given, then there is no difference within it, other than the quantitative. It represents a greater or lesser amount of general wealth according to whether its given unit is possessed in a greater or lesser quantity. If it is general wealth, then one is the richer the more of it one possesses, and the only important process, for the individual as well as the nation, is to pile it up [*Anhäufen*]. In keeping with this role, it was seen as that which steps outside circulation. Now this withdrawing of money from circulation, and *storing it up,* appears as the essential object [*Gegenstand*] of the drive to wealth and as the essential process of becoming wealthy. In gold and silver, I possess general wealth in its tangible form, and the more of it I pile up, the more general wealth do I appropriate. If gold and silver represent general wealth, then, as specific quantities, they represent it only to a degree which is definite, but which is capable of indefinite expansion. This accumulation [6] of gold and silver, which presents itself as their repeated withdrawal from circulation, is at the same time the act of bringing general wealth into safety and away from circulation, in which it is constantly lost in exchange for some particular wealth which ultimately disappears in consumption.

Among all the peoples of antiquity, the piling-up of gold and silver appears at first as a priestly and royal privilege, since the god and king of commodities pertains only to gods and kings. Only they deserve to possess wealth as such. This accumulation, then, occurs on one side merely to display overabundance, i.e. wealth as an extraordinary thing, for use on Sundays only; to provide gifts for temples and their gods; to finance public works of art; finally as *security* in case of extreme necessity, to buy arms etc. Later in antiquity, this accumulation becomes political. The *state treasury*, as reserve fund, and the temple are the original banks in which this holy of holies is preserved. Heaping-up and accumulating attain their ultimate development in the modern banks, but here with a further-developed character. On the other side, among private individuals, accumulation takes place for the purpose of bringing wealth into safety from the caprices of the external world in a tangible form in which it can be *buried* etc., in short, in which it enters into a wholly *secret* relation to the individual. This, still on a large historical scale, in Asia. Repeats itself in every panic, war etc. in bourgeois society, which then falls back into barbaric conditions. Like the accumulation of gold etc. as ornament and ostentation among semi-barbarians. But a very large and constantly growing part of it withdrawn from circulation as an object of luxury in the most developed bourgeois society. (See Jacob etc.) [7] As representative of general wealth, it is precisely its retention without abandoning it to circulation and employing it for particular needs, which is proof of the wealth of individuals; and to the degree that money develops in its various roles, i.e. that wealth as such becomes the general measure of the worth of individuals, [there develops] the drive to display it, hence the display of gold and silver as representatives of wealth; in the same way, Herr v. Rothschild displays as his proper emblem, I think, two banknotes of £100,000 each, mounted in a frame. The barbarian display of gold etc. is only a more naïve form of this modern one, since it takes place with less regard to gold as money. Here still the simple *glitter*. There a premeditated point. The point being that it is *not* used as money; here the form antithetical to circulation is what is important.

The accumulation of all other commodities is less ancient than that of gold and silver: (1) because of their perishability. Metals as such represent the enduring, relative to the other commodities; they are also accumulated by preference because of their greater rarity and their exceptional character as the instruments of production *par excellence.* The precious metals, because not oxidized by the air, are again more durable than the other metals. What other commodities lose is their form; but this form is what gives them their exchange value, while their use value consists in overcoming this form, in consuming it. With money, on the other hand, its substance, its materiality, is itself its form, in which it represents wealth. If money appears as the general commodity in all places, so also does it in all times. It maintains itself as wealth at all times. Its specific durability. It is the treasure which neither rust nor moths eat up. All commodities are only transitory money; money is the permanent commodity. Money is the omnipresent commodity; the commodity is only local money. But accumulation is essentially a process which takes place in time. In this connection, Petty says:

‘The great and ultimate effect of trade is not wealth as such, but preferably an overabundance of silver, gold and jewels, which are not *perishable,* nor as *fickle* as other commodities, but are wealth in all times and all places. A superfluity of wine, grain, poultry, meat etc. is wealth, but *hic et nunc* ... Therefore the production of those commodities and the effects of that trade which endow a land with gold and silver are advantageous above others.’ (p. 3.) ‘If taxes take money from one who eats or drinks it up, and give it to one who employs it in improving the land, in fisheries, in the working of mines, in manufactures or even in clothing, then for the community there is always an advantage; for even clothes are not as perishable as meals; if in the furnishing of houses, even more; in the building of houses yet more; in the improvement of land, working of mines, fisheries, more again; the most of all, when employed so as to bring gold and silver into the country, for these things alone *do not pass* *away*, but are prized at all times and in all places as wealth.' (p. 5.) [8] Thus a writer of the seventeenth century. One sees how the piling-up of gold and silver gained its true stimulus with the conception of it as the material representative and general form of wealth. The cult of money has its asceticism, its self-denial, its self-sacrifice – economy and frugality, contempt for mundane, temporal and fleeting pleasures; the chase after the *eternal* treasure. Hence the connection between English Puritanism, or also Dutch Protestantism, and money-making. A writer of the beginning of the seventeenth century (Misselden) expresses the matter quite unselfconsciously as follows:

'The natural material of commerce is the commodity, the artificial is money. Although money by nature and in time comes after the commodity, it has become, in present custom, the most important thing.' He compares this to the two sons of old Jacob: Jacob placed his right hand on the younger and his left on the older son. (p. 24.) 'We consume among us too great an excess of wines from Spain, France, the Rhine, the Levant, the Islands: raisins from Spain, currants from the Levant, cambrics from Hainault and the Netherlands, the silkenware of Italy, the sugar and tobacco of the West Indies, the spices of East India; all this is not necessary for us, but is paid for in *hard* money ... If less of the foreign and more of the domestic product were sold, then the difference would have to come to us in the form of gold and silver, as treasure.' (loc. cit.) [9] The modern economists naturally make merry at the expense of this sort of notion in the general section of books on economics. But when one considers the anxiety involved in the doctrine of money in particular, and the feverish fear with which, in practice, the inflow and outflow of gold and silver are watched in times of crisis, then it is evident that the aspect of money which the followers of the Monetary and Mercantilist System conceived in an artless one-sidedness is still to be taken seriously, not only in the mind, but as a real economic category.

The antithesis between the real needs of production and this supremacy of money is presented most forcibly in Boisguillebert. (See the striking passages in my Notebook.) [10]

(2) The accumulation of other commodities, their perishability apart, essentially different in two ways from the accumulation of gold and silver, which are here identical with money. First, the accumulation of other commodities does not have the character of accumulating wealth in general, but of

accumulating particular wealth, and it is therefore itself a particular act of production; here simple accumulation will not do. To accumulate grain requires special stores etc. Accumulating sheep does not make one into a shepherd; to accumulate slaves or land requires relations of domination and subordination etc. All this, then, requires acts and relations distinct from simple accumulation, from increase of wealth as such. On the other hand, in order then to realize the accumulated commodity in the form of general wealth, to appropriate wealth in all its particular forms, I have to engage in trade with the particular commodity I have accumulated, I have to be a grain merchant, cattle merchant, etc. Money as the *general* representative of wealth absolves me of this.

The accumulation of gold and silver, of money, is the first historic appearance of the gathering-together of capital and the first great means thereto; but, as such, it is not yet accumulation of capital. For that, the re-entry of what has been accumulated into circulation would itself have to be posited as the moment and the means of accumulation.

Money in its final, completed character now appears in all directions as a contradiction, a contradiction which dissolves itself, drives towards its own dissolution. As the *general form of wealth,* the whole world of real riches stands opposite it. It is their pure abstraction – hence, fixated as such, a mere conceit. Where wealth as such seems to appear in an entirely material, tangible form, its existence is only in my head, it is a pure fantasy. Midas. On the other side, as *material representative of general wealth,* it is realized only by being thrown back into circulation, to disappear in exchange for the singular, particular modes of wealth. It remains in circulation, as medium of circulation; but for the accumulating individual, it is lost, and this disappearance is the only possible way to secure it as wealth. To dissolve the things accumulated in individual gratifications is to realize them. The money may then be again stored up by other individuals, but then the same process begins anew. I can really posit its being for myself only by giving it up as mere being for others. If I want to cling to it, it evaporates in my hand to become a mere phantom of real wealth. Further: [the notion that] to accumulate it is to increase it, [since] its own quantity is the measure of its value, turns out again to be false. If the other riches do not [also] accumulate, then it loses its value in the measure in which it is accumulated. What appears as its increase is in fact its decrease. Its independence is a mere semblance; its independence of circulation exists only in view of circulation, exists as dependence on it. It pretends to be the general commodity, but because of its natural particularity it is again a particular commodity, whose value depends both on demand and supply, and on variations in its specific costs of production. And since it is incarnated in gold and silver, it becomes one-sided in every real form; so that when the one appears as money, the other appears as particular commodity, and vice versa, and in this way each appears in both aspects. As absolutely secure wealth, entirely independent of my individuality, it is at the same time, because it is something completely external to me, the absolutely insecure, which can be separated from me by any accident. Similarly, it has entirely contradictory qualities as measure, as medium of circulation, and as money as such. Finally, in the last-mentioned character, it also contradicts itself because it must represent value as such; but represents in fact only a constant amount of fluctuating value. It therefore suspends itself as *completed* exchange value.

As mere measure it already contains its own negation as medium of circulation; as medium of circulation and measure, as money. To negate it in the last quality is therefore at the same time to negate it in the two earlier ones. If negated as the mere *general form of wealth*, it must then realize itself in the particular substances of real wealth; but in the process of proving itself really to be the *material representative* of the totality of wealth, it must at the same time preserve itself as the general form. Its very entry into circulation must be a moment of its staying at home [*Beisichbleiben*], and its staying at home must be an entry into circulation. That is to say that as realized exchange value it must be simultaneously posited as the process in which exchange value is realized. This is at the same time the negation of itself as a purely objective form, as a form of wealth external and accidental to individuals. It must appear, rather, as the production of wealth; and wealth must appear as the result of the mutual relations among individuals in production. Exchange value is now characterized, therefore, no longer simply as a thing for which circulation is only an external movement, or which appears individually in a particular material: [but rather] as relation to itself through the process of circulation. On the other side, circulation itself is no longer [qualified] merely as the simple process of exchanging commodities for money and money for commodities, merely as the mediating movement by which the prices of the various commodities are realized, are equated as exchange values, with both [commodities and money] appearing as external to circulation: the presupposed exchange value, the ultimate withdrawal of the commodity into consumption, hence the destruction of exchange value, on one side, and the withdrawal of the money, its achievement of independence *vis-à-vis* its substance, which is again another form of its destruction [on the other]. [Rather,] exchange value itself, and now no longer exchange value in general, but measured exchange value, has to appear as a presupposition posited by circulation itself, and, as posited by it, its presupposition. The process of circulation must also and equally appear as the process of the production of exchange values. It is thus, on one side, the regression of exchange value into labour, on the other side, that of money into exchange value, which is now posited, however, in a more profound character. With circulation, the determined price is presupposed, and circulation as money posits it only formally. The *determinateness* of exchange value itself, or the measure of price, must now itself appear as an act of circulation. Posited in this way, exchange value is *capital*, and circulation is posited at the same time as an act of production.

To be brought forward: In circulation, as it appears as money circulation, the simultaneity of both poles of exchange is always presupposed. But a difference of time may appear between the existence of the commodities to be exchanged. It may lie in the nature of reciprocal services that a service is performed today, but the service required in return can be performed only after a year etc. ‘In the majority of contracts,’ says Senior, ‘only one of the contracting parties has the thing available and lends it; and if exchange is to take place, one party has to cede it immediately on the condition of receiving the equivalent only in a later period. Since, however, the value of all things changes in a given space of time, the means of payment employed is that thing whose value varies least, and which maintains a given average capacity to buy things for the longest time. Thus money becomes *the expression or the representative* of value.’ [11] According to this there would be no connection at all between the latter quality of money and the former. But this is wrong. Only when money is posited as the autonomous representative of value do contracts cease to be valued e.g. in quantities of grain or in services to be performed. (The latter was current e.g. in feudalism.) It is merely a notion held by Mr Senior that money has a ‘longer average capacity’ to maintain its value. The fact is that it is employed as the general material of contracts (*general commodity of contracts,* says Bailey) [12] because it is the *general commodity,* the *representative of general wealth* (says Storch), [13] because it is *exchange value become independent.* Money has to be already very developed in its two earlier functions before it can appear generally in this role. Now it turns out in fact that, although the quantity of money remains uniformly the same, its value changes: that, in general, as a specific amount, it is subject to the mutability of all values. Here its nature as a particular commodity comes to the fore against its general character. To money as measure, this change is irrelevant, for ‘in a changing medium, two different relations to the same thing can always be expressed, just as well as in a constant medium’. [14] As medium of circulation it is also irrelevant, since its quantity as such is set by the measure. But as *money* in the form in which it appears in contracts, this is essential, just as, in general, its contradictions come to the fore in this role.

In separate sections, to be brought forward:

(1) *Money as coin.* This very summarily about coinage. (2) Historically the sources of gold and silver. Discoveries etc. The history of their production. (3) Causes of the variations in the value of the precious metals and hence of metallic money; effects of this variation on industry and the different classes. (4) *Above all:* quantity of circulation in relation to rise and fall of prices. (Sixteenth century. Nineteenth century.) Along the way, to be seen also how it is affected as measure by rising quantity etc. (5) About circulation: velocity, necessary amount, effect of circulation; more, less developed etc. (6) Solvent effect of money.

(*This to be brought forward.*) (Herein the specific economic investigations.)

(The specific gravity of gold and silver, to contain much weight in a relatively small volume, as compared with other metals, repeats itself in the world of values so that it contains much value (labour time) in relatively small volume. The labour time, exchange value realized in it, is the specific weight of the commodity. This makes the precious metals particularly suited for service in circulation (since one can carry a significant amount of value in the pocket) and for accumulation, since one can secure and stockpile a great amount of value in a small space. Gold does not turn into something else in the process, like iron, lead etc. Remains what it is.)

‘If Spain had never owned the mines of Mexico and Peru, it would never have had need of the grain of Poland.’ (Ravenstone.) [15]

‘Illi unum consilium habent et virtutem et potestatem suam bestiae tradent … Et ne quis posset emere aut vendere, nisi qui habet characterem aut nomen bestiae, aut numerum nominis ejus.’ (*Apocalypse. Vulgate.*) [16] ‘The correlative quantities of commodities which are given for one another, constitute the price of the commodity.’ (Storch.) ‘Price is the degree of exchangeable value.’ (loc cit.) [17]

As we have seen, in simple circulation as such (exchange value in its movement), the action of the individuals on one another is, in its content, only a reciprocal, self-interested satisfaction of their needs; in its form, [it is] exchange among equals (equivalents). Property, too, is still posited here only as the appropriation of the product of labour by labour, and of the product of alien labour by one’s own labour, in so far as the product of one’s own labour is bought by alien labour. Property in alien labour is mediated by the equivalent of one’s own labour. This form of property – quite like freedom and equality – is posited in this simple relation. In the further development of exchange value this will be transformed, and it will ultimately be shown that private property in the product of one’s own labour is identical with the separation of labour and property, so that labour will create alien property and property will command alien labour.

The Chapter on Capital [18]

‘From the beginnings of civilization, men have fixed the exchange value of the products of their labour not by comparison with the *products offered in exchange,* but by comparison with a product they preferred.’ (Ganilh, 13,9.) [19]

Simple exchange. **Relations between exchangers.** ***Harmonies of equality, freedom, etc. (Bastiat, Proudhon)***

The special difficulty in grasping money in its fully developed character as money – a difficulty which political economy attempts to evade by forgetting now one, now another aspect, and by appealing to one aspect when confronted with another – is that a social relation, a definite relation between individuals, here appears as a metal, a stone, as a purely physical, external thing which can be found, as such, in nature, and which is indistinguishable in form from its natural existence. Gold and silver, in and of themselves, are not money. Nature does not produce money, any more than it produces a rate of exchange or a banker. In Peru and Mexico gold and silver did not serve as money, although it does appear here as jewellery, and there is a developed system of production. To be money is not a natural attribute of gold and silver, and is therefore quite unknown to the physicist, chemist etc. as such. But money is directly gold and silver. Regarded as a measure, money still predominates in its formal quality; even more so as coin, where this appears externally on its face impression; but in its third aspect, i.e. in its perfection, where to be measure and coinage appear as functions of money alone, there all formal character has vanished, or directly coincides with its metallic existence. It is not at all apparent on its face that its character of being money is merely the result of social processes; it *is* money. This is all the more difficult since its immediate use value for the living individual stands in no relation whatever to this role, and because, in general, the memory of use value, distinct from exchange value, has become entirely extinguished in this incarnation of pure exchange value. Thus the fundamental contradiction contained in exchange value, and in the social mode of production corresponding to it, here emerges in all its purity. We have already criticized the attempts made to overcome this contradiction by depriving money of its metallic form, by positing it outwardly, as well, as something *posited* by society, as the expression of a social relation, whose ultimate form would be that of labour-money. It must by now have become entirely clear that this is a piece of foolishness as long as exchange value is retained as the basis, and that, moreover, the illusion that metallic money allegedly falsifies exchange arises out of total ignorance of its nature. It is equally clear, on the other side, that to the degree to which opposition against the ruling relations of production grows, and these latter themselves push ever more forcibly to cast off their old skin – to that degree, polemics are directed against metallic money or money in general, as the most striking, most contradictory and hardest phenomenon which is presented by the system in a palpable form. One or another kind of artful tinkering with money is then supposed to overcome the contradictions of which money is merely the perceptible appearance. Equally clear that some revolutionary operations can be performed with money, in so far as an attack on it seems to leave everything else as it was, and only to rectify it. Then one strikes a blow at the sack, intending the donkey. However, as long as the donkey does not feel the blows on the sack, one hits in fact only the sack and not the donkey. As soon as he feels it, one strikes the donkey and not the sack. As long as these operations are directed against money as such, they are merely an attack on consequences whose causes remain unaffected; i.e. disturbance of the productive process, whose solid basis then also has the power, by means of a more or less violent reaction, to define and to dominate these as mere passing *disturbances*.

On the other hand, it is in the character of the money relation – as far as it is developed in its purity to this point, and without regard to more highly developed relations of production – that all inherent contradictions of bourgeois society appear extinguished in money relations as conceived in a simple form; and bourgeois democracy even more than the bourgeois economists takes refuge in this aspect (the latter are at least consistent enough to regress to even simpler aspects of exchange value and exchange) in order to construct apologetics for the existing economic relations. Indeed, in so far as the commodity or labour is conceived of only as exchange value, and the relation in which the various commodities are brought into connection with one another is conceived as the exchange of these exchange values with one another, as their equation, then the individuals, the subjects between whom this process goes on, are simply and only conceived of as exchangers. As far as the formal character is concerned, there is absolutely no distinction between them, and this is the economic character, the aspect in which they stand towards one another in the exchange relation; it is the indicator of their social function or social relation towards one another. Each of the subjects is an exchanger; i.e. each has the same social relation towards the other that the other has towards him. As subjects of exchange, their relation is therefore that of equality. It is impossible to find any trace of distinction, not to speak of contradiction, between them; not even a difference. Furthermore, the commodities which they exchange are, as exchange values, equivalent, or at least count as such (the most that could happen would be a subjective error in the reciprocal appraisal of values, and if one individual, say, cheated the other, this would *happen not because of the nature of the social function in which they confront one another,* for this is *the same*, in this they are *equal*; but only because of natural cleverness, persuasiveness etc., in short only the purely individual superiority of one individual over another. The difference would be one of natural origin, irrelevant to the nature of the relation as such, and it may be said in anticipation of further development, the difference is even lessened and robbed of its original force by competition etc.). As regards the pure form, the economic side of this relation – the content, outside this form, here still falls entirely outside economics, or is posited as a natural content distinct from the economic, a content about which it may be said that it is still entirely separated from the economic relation because it still directly coincides with it – then only three moments emerge as formally distinct: the subjects of the relation, *the exchangers* (posited in the same character); the objects of their exchange, exchange values, *equivalents*, which not only are equal but are expressly supposed to be equal, and are posited as equal; and finally the act of exchange itself, the mediation by which the subjects are posited as exchangers, equals, and their objects as equivalents, equal. The equivalents are the objectification [*Vergegenständlichung*] of one subject for another; i.e. they themselves are of equal worth, and assert themselves in the act of exchange as equally worthy, and at the same time as mutually indifferent. The subjects in exchange exist for one another only through these equivalents, as of equal worth, and prove themselves to be such through the exchange of the objectivity in which the one exists for the other. Since they only exist for one another in exchange in this way, as equally worthy persons, possessors of equivalent things, who thereby prove their equivalence, they are, as equals, at the same time also indifferent to one another; whatever other individual distinction there may be does not concern them; they are indifferent to all their other individual peculiarities. Now, as regards the content outside the act of exchange (an act which constitutes the positing as well as the proving of the exchange values and of the subjects as exchangers), this content, which falls outside the specifically economic form, can only be: (1) The natural particularity of the commodity being exchanged. (2) The particular natural need of the exchangers, or, both together, the different use values of the commodities being exchanged. The content of the exchange, which lies altogether outside its economic character, far from endangering the social equality of individuals, rather makes their natural difference into the basis of their social equality. If individual A had the same need as individual B, and if both had realized their labour in the same object, then no relation whatever would be present between them; considering only their production, they would not be different individuals at all. Both have the need to breathe; for both the air exists as atmosphere; this brings them into no social contact; as breathing individuals they relate to one another only as natural bodies, not as persons. Only the differences between their needs and between their production gives rise to exchange and to their social equation in exchange; these natural differences are therefore the precondition of their social equality in the act of exchange, and of this relation in general, in which they relate to one another as productive. Regarded from the standpoint of the natural difference between them, individual A exists as the owner of a use value for B, and B as owner of a use value for A. In this respect, their natural difference again puts them reciprocally into the relation of equality. In this respect, however, they are not indifferent to one another, but integrate with one another, have need of one another; so that individual B, as objectified in the commodity, is a need of individual A, and vice versa; so that they stand not only in an equal, but also in a social, relation to one another. This is not all. The fact that this need on the part of one can be satisfied by the product of the other, and vice versa, and that the one is capable of producing the object of the need of the other, and that each confronts the other as owner of the object of the other's need, this proves that each of them reaches beyond his own particular need etc., as a *human being*, and that they relate to one another as human beings; that their common species-being [*Gattungswesen*] is acknowledged by all. It does not happen elsewhere – that elephants produce for tigers, or animals for other animals. For example. A hive of bees comprises at bottom only one bee, and they all produce the same thing. Further. In so far as these natural differences among individuals and among their commodities (products, labour etc. are not as yet different here, but exist only in the form of commodities, or, as Mr Bastiat prefers, following Say, *services* [20]; Bastiat fancies that, by reducing the economic character of exchange value to its natural content, commodity or service, and thereby showing himself incapable of grasping the economic relation of exchange value as such, he has progressed a great step beyond the classical economists of the English school, who are capable of grasping the relations of production in their specificity, as such, in their pure form) form the motive for the integration of these individuals, for their social interrelation as exchangers, in which they are *stipulated* for each other as, and *prove* themselves to be, equals, there enters, in addition to the quality of equality, that of *freedom*. Although individual A feels a need for the commodity of individual B, he does not appropriate it by force, nor vice versa, but rather they recognize one another reciprocally as proprietors, as persons whose will penetrates their commodities. Accordingly, the juridical moment of the Person enters here, as well as that of freedom, in so far as it is contained in the former. No one seizes hold of another's property by force. Each divests himself of his property voluntarily. But this is not all: individual A serves the need of individual B by means of the commodity *a* only in so far as and because individual B serves the need of individual A by means of the commodity *b*, and vice versa. Each serves the other in order to serve himself; each makes use of the other, reciprocally, as his means. Now both things are contained in the consciousness of the two individuals: (1) that each arrives at his end only in so far as he serves the other as means; (2) that each becomes means for the other (being for another) [*Sein für andres*] only as end in himself (being for self) [Sein für sich]

[21]; (3) that the reciprocity in which each is at the same time means and end, and attains his end only in so far as he becomes a means, and becomes a means only in so far as he posits himself as end, that each thus posits himself as being for another, in so far as he is being for self, and the other as being for him, in so far as he is being for himself – that this reciprocity is a necessary fact, presupposed as natural precondition of exchange, but that, as such, it is irrelevant to each of the two subjects in exchange, and that this reciprocity interests him only in so far as it satisfies his interest to the exclusion of, without reference to, that of the other. That is, the common interest which appears as the motive of the act as a whole is recognized as a fact by both sides; but, as such, it is not the motive, but rather proceeds, as it were, behind the back of these self-reflected particular interests, behind the back of one individual's interest in opposition to that of the other. In this last respect, the individual can at most have the consoling awareness that the satisfaction of his antithetical individual interest is precisely the realization of the suspended antithesis, of the social, general interest. Out of the act of exchange itself, the individual, each one of them, is reflected in himself as its exclusive and dominant (determinant) subject. With that, then, the complete freedom of the individual is posited: voluntary transaction; no force on either side; positing of the self as means, or as serving, only as means, in order to posit the self as end in itself, as dominant and primary [*übergreifend*]; finally, the self-seeking interest which brings nothing of a higher order to realization; the other is also recognized and acknowledged as one who likewise realizes his self-seeking interest, so that both know that the common interest exists only in the duality, many-sidedness, and autonomous development of the exchanges between self-seeking interests. The general interest is precisely the generality of self-seeking interests. Therefore, when the economic form, exchange, posits the all-sided equality of its subjects, then the content, the individual as well as the objective material which drives towards the exchange, is *freedom*. Equality and freedom are thus not only respected in exchange based on exchange values but, also, the exchange of exchange values is the productive, real basis of all *equality* and *freedom*. As pure ideas they are merely the idealized expressions of this basis; as developed in juridical, political, social relations, they are merely this basis to a higher power. And so it has been in history. Equality and freedom as

developed to this extent are exactly the opposite of the freedom and equality in the world of antiquity, where developed exchange value was not their basis, but where, rather, the development of that basis destroyed them. Equality and freedom presuppose relations of production as yet unrealized in the ancient world and in the Middle Ages. Direct forced labour is the foundation of the ancient world; the community rests on this as its foundation; labour itself as a ‘privilege’, as still particularized, not yet generally producing exchange values, is the basis of the world of the Middle Ages. Labour is neither forced labour; nor, as in the second case, does it take place with respect to a common, higher unit (the guild).

Now, it is admittedly correct that the [relation between those] engaged in exchange, in so far as their motives are concerned, i.e. as regards natural motives falling outside the economic process, does also rest on a certain compulsion; but this is, on one side, itself only the other’s indifference to my need as such, to my natural individuality, hence his equality with me and his freedom, which are at the same time the precondition of my own; on the other side, if I am determined, forced, by my needs, it is only my own nature, this totality of needs and drives, which exerts a force upon me; it is nothing alien (or, my *interest* posited in a general, reflected form). But it is, after all, precisely in this way that I exercise compulsion ever the other and drive him into the exchange system.

In Roman law, the *servus* is therefore correctly defined as one who may not enter into exchange for the purpose of acquiring anything for himself (see the *Institutes*). [22] It is, consequently, equally clear that although this legal system corresponds to a social state in which exchange was by no means developed, nevertheless, in so far as it was developed in a limited sphere, it was able to develop the *attributes of the juridical person, precisely of the individual engaged in exchange*, and thus anticipate (in its basic aspects) the legal relations of industrial society, and in particular the right which rising bourgeois society had necessarily to assert against medieval society. But the development of this right itself coincides completely with the dissolution of the Roman community.

Since money is only the realization of exchange value, and since the system of exchange values has realized itself only in a developed money system, or inversely, the money system can indeed only be the realization of this system of freedom and equality. As measure, money only gives the equivalent its specific expression, makes it into an equivalent in form, as well. A distinction of form does, it is true, arise within circulation: the two exchangers appear in the different roles of buyer and seller; exchange value appears once in its general form, in the form of money, then again in its particular form, in the natural commodity, now with a price; but, first of all, these forms alternate; circulation itself creates not a disequation, but only an equation, a suspension of the merely negated difference. The inequality is only a purely formal one. Finally, even equality now posits itself tangibly, in money as medium of circulation, where it appears now in one hand, now in another, and is indifferent to this appearance. Each appears towards the other as an owner of money, and, as regards the process of exchange, as money itself. Thus indifference and equal worthiness are expressly contained in the form of the thing. The particular natural difference which was contained in the commodity is extinguished, and constantly becomes extinguished by circulation. A worker who buys commodities for 3s. appears to the seller in the same function, in the same equality – in the form of 3s. – as the king who does the same. All distinction between them is extinguished. The seller *qua* seller appears only as owner of a commodity of the price of 3s., so that both are completely equal; only that the 3s. exist here in the form of silver, there again in the form of sugar, etc. In the third form of money, a distinguishing quality might seem to enter between the subjects of the process. But in so far as money here appears as the material, as the general commodity of contracts, all distinction between the contracting parties is, rather, extinguished. In so far as money, the general form of wealth, becomes the object of accumulation, the subject here appears to withdraw it from circulation only to the extent that he does not withdraw commodities of an equal price from circulation. Thus, if one individual accumulates and the other does not, then none does it at the expense of the other. One enjoys real wealth, the other takes possession of wealth in its general form. If one grows impoverished and the other grows wealthier, then this is of their own free will and does not in any way arise from the economic relation, the economic connection as such, in which they are placed in relation to one another. Even inheritance and similar legal relations, which perpetuate such inequalities, do not prejudice this natural freedom and equality. If individual A’s relation is not in contradiction to this system originally, then such a contradiction can surely not arise from the fact that individual B steps into the place of individual A, thus perpetuating him. This is, rather, the perpetuation of the social relation beyond one man’s natural lifespan: its reinforcement against the chance influences of nature, whose effects as such would in fact be a suspension of individual freedom. Moreover, since the individual in this relation is merely the individuation of money, therefore he is, as such, just as immortal as money, and his representation by heirs is the logical extension of this role.

If this way of conceiving the matter is not advanced in its historic context, but is instead raised as a refutation of the more developed economic relations in which individuals relate to one another no longer merely as exchangers or as buyers and sellers, but in specific relations, no longer all of the same character; then it is the same as if it were asserted that there is no difference, to say nothing of antithesis and contradiction, between natural bodies, because all of them, when looked at from e.g. the point of view of their weight, have weight, and are therefore equal; or are equal because all of them occupy three dimensions. Exchange value itself is here similarly seized upon in its simple character, as the antithesis to its more developed, contradictory forms. In the course of science, it is just these abstract attributes which appear as the earliest and sparsest; they appear in part historically in this fashion, too; the more developed as the more recent. In present bourgeois society as a whole, this positing of prices and their circulation etc. appears as the surface process, beneath which, however, in the depths, entirely different processes go on, in which this apparent individual equality and liberty disappear. It is forgotten, on one side, that the *presupposition* of exchange value, as the objective basis of the whole of the system of production, already in itself implies compulsion over the individual, since his immediate product is not a product for him, but only *becomes* such in the social process, and since it *must* take on this general but nevertheless external form; and that the individual has an existence only as a producer of exchange value, hence that the whole negation of his natural existence is already implied; that he is therefore entirely determined by society; that this further presupposes a division of labour etc., in which the individual is already posited in relations other than that of mere *exchanger*, etc. That therefore this presupposition by no means arises either out of the individual's will or out of the immediate nature of the individual, but that it is, rather, *historical*, and posits the individual as already *determined* by society. It is forgotten, on the other side, that these higher forms, in which exchange, or the relations of production which realize themselves in it, are now posited, do not by any means stand still in this simple form where the highest distinction which occurs is a formal and hence irrelevant one. What is overlooked, finally, is that already the simple forms of exchange value and of money latently contain the opposition between labour and capital etc. Thus, what all this wisdom comes down to is the attempt to stick fast at the simplest economic relations, which, conceived by themselves, are pure abstractions; but these relations are, in reality, mediated by the deepest antithesis, and represent only one side, in which the full expression of the antitheses is obscured.

What this reveals, on the other side, is the foolishness of those socialists (namely the French, who want to depict socialism as the realization of the ideals of *bourgeois* society articulated by the French revolution) who demonstrate that exchange and exchange value etc. are *originally* (in time) or *essentially* (in their adequate form) a system of universal freedom and equality, but that they have been perverted by money, capital, etc. [23] Or, also, that history has so far failed in every attempt to implement them in their true manner, but that they have now, like Proudhon, discovered e.g. the real Jacob, and intend now to supply the genuine history of these relations in place of the fake. The proper reply to them is: that exchange value or, more precisely, the money system is in fact the system of equality and freedom, and that the disturbances which they encounter in the further development of the system are disturbances inherent in it, are merely the realization of *equality and freedom*, which prove to be inequality and unfreedom. It is just as pious as it is stupid to wish that exchange value would not develop into capital, nor labour which produces exchange value into wage labour. What divides these gentlemen from the bourgeois apologists is, on one side, their sensitivity to the contradictions included in the system; on the other, the utopian inability to grasp the necessary difference between the real and the ideal form of bourgeois society, which is the cause of their desire to undertake the superfluous business of realizing the ideal expression again, which is in fact only the inverted projection [*Lichtbild*] of this reality. And now, indeed, in opposition to these socialists there is the stale argumentation of the degenerate economics of most recent times (whose classical representative as regards insipidness, affectation of dialectics, puffy arrogance, effete, complacent platitudinousness and complete inability to grasp historic processes is *Frederick Bastiat*, because the American, Carey, at least brings out the specific American relations as against the European), *which demonstrates* that economic relations everywhere express *the same* simple determinants, and hence that they everywhere express the equality and freedom of the simple exchange of exchange values; this point entirely reduces itself to an infantile abstraction. For example, the relation between capital and interest is reduced to the exchange of exchange values. Thus, after first taking from the empirical world the fact that exchange value exists not only in this simple form but also in the essentially different form of capital, capital is then in turn reduced again to the simple concept of exchange value; and interest, which, to crown all, expresses a specific relation of capital as such, is similarly torn out of this specificity and equated with exchange value; the whole relation in its specific character is reduced to an abstraction and everything reduced to the undeveloped relation of commodity exchange. In so far as I abstract from what distinguishes a concrete from its abstract, it is of course the abstract, and does not differ from it at all. *According to this, all economic categories are only so many names for what is always the same relation, and this crude inability to grasp the real distinctions is then supposed to represent pure common sense as such. The 'economic harmonies' of Mr Bastiat amount* au fond *to the assertion that there exists only one single economic relation which takes on different names, or that any differences which occur, occur only in name*. The reduction is not even formally scientific to the minimal extent that everything is reduced to a real economic relation by dropping the difference that development makes; rather, sometimes one and sometimes another side is dropped in order to bring out now one, now another side of the identity. For example, the wage for labour is payment for a service done by one individual for another. (The economic form as such is dropped here, as noted above.) Profit is also payment for a service done by one individual for another. Hence wages and profit are identical, and it is, in the first place, an error of language to call one payment wages, the other profit.

But let us now look at profit and interest. With profit, the payment of the service is exposed to chance fluctuations; with interest, it is fixed. Thus, since, with wages, payment is relatively speaking exposed to chance fluctuations, while with profit, in contrast to labour, it is fixed, it follows that the relation between interest and profit is the same as that between wages and profit, which, as we have seen, is the exchange of equivalents for one another. The opponents [24] then take this twaddle (which goes back from the economic relations where the contradiction is expressed to those where it is only latent and obscured) literally, and demonstrate that e.g. with capital and interest there is not a simple exchange, since capital is not replaced by an equivalent, but that the owner of capital, rather, having consumed the equivalent 20 times over in the form of interest, still has it in the form of capital and can exchange it for 20 more equivalents. Hence the unedifying debate in which one side asserts that there is no difference between developed and undeveloped exchange value, and the other asserts that there is, unfortunately, a difference, but, by rights, there ought not to be.

Capital.* Sum of values. – *Landed property and capital. – Capital comes from circulation. Content exchange value. – Merchant capital, money capital, and money interest. – Circulation presupposes another process. Motion between presupposed extremes

Money as capital is an aspect of money which goes beyond its simple character as money. It can be regarded as a higher realization; as it can be said that man is a developed ape. However, in this way the lower form is posited as the primary subject, over the higher. In any case, *money as capital* is distinct from *money as money*. The new aspect is to be developed. On the other hand, *capital as money* seems to be a regression of capital to a lower form. But it is only the positing of capital in a particular form which already existed prior to it, as non-capital, and which makes up one of its presuppositions. Money recurs in all later relations; but then it does not function as mere money. If, as here, the initial task is to follow it up to its totality as money-market, then the rest of the development is presupposed and has to be brought in occasionally. Thus we give here the general character of capital before we proceed to its particularity as money.

If I state, like for example Say, that capital is a *sum of values*, [25] then I state nothing more than that *capital = exchange value*. Every sum of values is an exchange value, and every exchange value is a sum of values. I cannot get from exchange value to capital by means of mere addition. In the pure accumulation of money, as we have seen, the relation of capitalizing [*Kapitalisieren*] is not yet posited.

In so-called retail trade, in the daily traffic of bourgeois life as it proceeds directly between producers and consumers, in petty commerce, where the aim on one side is to exchange the commodity for money and on the other to exchange money for commodity, for the satisfaction of individual needs – in this movement, which proceeds on the surface of the bourgeois world, there and there alone does the motion of exchange values, their circulation, proceed in its pure form. A worker who buys a loaf of bread and a millionaire who does the same appear in this act only as simple buyers, just as, in respect to them, the grocer appears only as seller. All other aspects are here extinguished. The *content* of these purchases, like their *extent*, here appears as completely irrelevant compared with the formal aspect.

As in the theory the concept of value precedes that of capital, but requires for its pure development a mode of production founded on capital, so the same thing takes place in practice. The economists therefore necessarily sometimes consider capital as the creator of values, as their source, while at other times they presuppose values for the formation of capital, and portray it as itself only a sum of values in a particular function. The existence of value in its purity and generality presupposes a mode of production in which the individual product has ceased to exist for the producer in general and even more for the individual worker, and where nothing exists unless it is realized through circulation. For the person who creates an infinitesimal part of a yard of cotton, the fact that this is value, exchange value, is not a formal matter. If he had not created an exchange value, money, he would have created nothing at all. This determination of value, then, presupposes a given historic stage of the mode of social production and is itself something given with that mode, hence a historic relation.

At the same time, individual moments of value-determination develop in earlier stages of the historic process of social production and appear as its result.

Hence, within the system of bourgeois society, capital follows immediately after money. *In history, other systems come before*, and they form the material basis of a less complete development of value. Just as exchange value here plays only an accompanying role to use value, it is not capital but the relation of landed property which appears as its real basis. Modern landed property, on the other hand, cannot be understood at all, because it cannot exist, without capital as its presupposition, and it indeed appears historically as a transformation of the preceding historic shape of landed property by capital so as to correspond to capital. It is, therefore, precisely in the development of landed property that the gradual victory and formation of capital can be studied, which is why Ricardo, the economist of the modern age, with great historical insight, examined the relations of capital, wage labour and ground rent within the sphere of landed property, so as to establish their specific form. The relation between the industrial capitalist and the proprietor of land appears to be a relation lying outside that of landed property. But, as a relation between the modern farmer and the landowner, it appears posited as an immanent relation of landed property itself; and the [latter], [26] as now existing merely in its relation to capital. The history of landed property, which would demonstrate the gradual transformation of the feudal landlord into the landowner, of the hereditary, semi-tributary and often unfree tenant for life into the modern farmer, and of the resident serfs, bondsmen and villeins who belonged to the property into agricultural day-labourers, would indeed be the history of the formation of modern capital. It would include within it the connection with urban capital, trade, etc. But we are dealing here with developed bourgeois society, which is already moving on its own foundation.

Capital comes initially from circulation, and, moreover, its point of departure is money. We have seen that money which enters into circulation and at the same time returns from it to itself is the last requirement, in which money suspends itself. It is at the same time the first concept of capital, and the first form in which it appears. Money has negated itself as something which merely dissolves in circulation; but it has also equally negated itself as something which takes up an independent attitude towards circulation. This negation, as a single whole, in its positive aspects, contains the first elements of capital. Money is the first form in which capital as such appears. M–C–C–M; that money is exchanged for commodity and the commodity for money; *this movement of buying in order to sell, which makes up the formal aspect of commerce, of capital as merchant capital,* is found in the earliest conditions of economic development; it is the first movement in which exchange value as such forms the content – is not only the form but also its own content. This motion can take place within peoples, or between peoples for whose production exchange value has by no means yet become the presupposition. The movement only seizes upon the surplus of their directly useful production, and proceeds only on its margin. Like the Jews within old Polish society or within medieval society in general, entire trading peoples, as in antiquity (and, later on, the Lombards), can take up this position between peoples whose mode of production is not yet determined by exchange value as the fundamental presupposition. Commercial capital is only circulating capital, and circulating capital is the first form of capital; in which it has *as yet by no means become the foundation of production.* A more developed form is *money capital* and *money interest*, usury, whose independent appearance belongs in the same way to an earlier stage. Finally, the form C–M–M–C, in which money and circulation in general appear as mere means for the *circulating commodity*, which for its part again steps outside circulation and directly satisfies a need, this is itself the presupposition of that original appearance of merchant capital. The presuppositions appear distributed among different peoples; or, within society, commercial capital as such appears only as determined by this purely consumption-directed circulation. On the other side, the *circulating commodity*, the commodity which realizes itself only by taking on the form of another commodity, which steps outside circulation and serves immediate needs, is similarly [the] [27] first form of capital, which is essentially *commodity capital*.

On the other side it is equally clear that the simple movement of exchange values, such as is present in pure circulation, can never realize capital. It can lead to the withdrawal and stockpiling of money, but as soon as money steps back into circulation, it dissolves itself in a series of exchange processes with commodities which are consumed, hence it is lost as soon as its purchasing power is exhausted. Similarly, the commodity which has exchanged itself for another commodity through the medium of money steps outside circulation in order to be consumed, destroyed. But if it is given independence from circulation, as money, it then merely represents the non-substantial general form of wealth. Since equivalents are exchanged for one another, the form of wealth which is fixed as money disappears as soon as it is exchanged for the commodity; and the use value present in the commodity, as soon as it is exchanged for money. All that can happen in the simple act of exchange is that each can be lost in its role for the other as soon as it realizes itself in it. None can maintain itself in its role by going over into the other. For this reason the sophistry of the bourgeois economists, who embellish capital by reducing it in argument to pure exchange, has been countered by its inversion, the equally sophistical, but, in relation to them, legitimate demand that capital be *really* reduced to pure exchange, whereby it would disappear as a power and be destroyed, whether in the form of money or of the commodity. *

> * Just as exchange value, i.e. all relations of commodities as exchange values, appears in money to be a thing, so do all aspects of the activity which creates exchange values, labour, appear in *capital*.

The repetition of the process from either of the points, money or commodity, is not posited within the conditions of exchange itself. The act can be repeated only until it is completed, i.e. until the amount of the exchange value is exchanged away. It cannot ignite itself anew through its own resources. *Circulation therefore does not carry within itself the principle of self-renewal. The moments of the latter are presupposed to it*, not posited by it. Commodities constantly have to be thrown into it anew from the outside, like fuel into a fire. Otherwise it flickers out in indifference. It would die out with money, as the indifferent result which, in so far as it no longer stood in any connection with commodities, prices or circulation, would have ceased to be money, to express a relation of production; only its metallic existence would be left over, while its economic existence would be destroyed. Circulation, therefore, which appears as that which is immediately present on the surface of bourgeois society, exists only in so far as it is constantly mediated. Looked at in itself, it is the mediation of presupposed extremes. But it does not posit these extremes. Thus, it has to be mediated not only in each of its moments, but as a whole of mediation, as a total process itself. Its immediate being is therefore pure semblance. *It is the phenomenon of a process taking place behind it.* It is now negated in every one of its moments: as a commodity – as money – and as a relation of the two, as simple exchange and circulation of both. While, originally, the act of social production appeared as the positing of exchange values and this, in its later development, as circulation – as completely developed reciprocal movement of exchange values – now, circulation itself returns back into the activity which posits or produces exchange values. It returns into it as into its ground. [28] It is commodities (whether in their particular form, or in the general form of money) which form the presupposition of circulation; they are the realization of a definite labour time and, as such, values; their presupposition, therefore, is both the production of commodities by labour and their production as exchange values. This is their point of departure, and through its own motion it goes back into exchange-value-creating production as its result. We have therefore reached the point of departure again, *production* which posits, creates exchange values; but this time, *production which presupposes circulation as a developed moment* and which appears as a constant process, which posits circulation and constantly returns from it into itself in order to posit it anew. The movement which creates exchange value thus appears here in a much more complex form, since it is no longer only the movement of presupposed exchange values, or the movement which posits them formally as prices, but which creates, brings them forth at the same time as presuppositions. Production itself is here no longer present in advance of its products, i.e. presupposed; it rather appears as simultaneously bringing forth these results; but it does not bring them forth, as in the first stage, as merely leading into circulation, but as simultaneously presupposing circulation, the developed process of circulation. (Circulation consists at bottom only of the formal process of positing exchange value, sometimes in the role of the commodity, at other times in the role of money.)

Transition from circulation to capitalist production. – Capital objectified labour etc. – Sum of values for production of values

This movement appears in different forms, not only historically, as leading towards value-producing labour, but also within the system of bourgeois production itself, i.e. production for exchange value. With semi-barbarian or completely barbarian peoples, there is at first interposition by trading peoples, or else tribes whose production is different by nature enter into contact and exchange their superfluous products. The former case is a more classical form. Let us therefore dwell on it. The exchange of the overflow is a traffic which posits exchange and exchange value. But it extends only to the overflow and plays an accessory role to production itself. But if the trading peoples who solicit exchange appear repeatedly (the Lombards, Normans etc. play this role towards nearly all European peoples), and if an ongoing commerce develops, although the producing people still engages only in so-called *passive* trade, since the impulse for the activity of positing exchange values comes from the outside and not from the inner structure of its production, then the surplus of production must no longer be something accidental, occasionally present, but must be constantly repeated; and in this way domestic production itself takes on a tendency towards circulation, towards the positing of exchange values. At first the effect is of a more physical kind. The sphere of needs is expanded; the aim is the satisfaction of the new needs, and hence greater regularity and an increase of production. The organization of domestic production itself is already modified by circulation and exchange value; but it has not yet been completely invaded by them, either over the surface or in depth. This is what is called the *civilizing influence* of external trade. The degree to which the movement towards the establishment of exchange value then attacks the whole of production depends partly on the intensity of this external influence, and partly on the degree of development attained by the elements of domestic production – division of labour etc. In England, for example, the import of Netherlands commodities in the sixteenth century and at the beginning of the seventeenth century gave to the surplus of wool which England had to provide in exchange, an essential, decisive role. In order then to produce more wool, cultivated land was transformed into sheep-walks, the system of small tenant-farmers was broken up etc., clearing of estates took place etc. Agriculture thus lost the character of labour for use value, and the exchange of its overflow lost the character of relative indifference in respect to the inner construction of production. At certain points, agriculture itself became purely determined by circulation, transformed into production for exchange value. Not only was the mode of production altered thereby, but also all the old relations of population and of production, the economic relations which corresponded to it, were dissolved. Thus, here was a circulation which presupposed a production in which only the overflow was created as exchange value; but it turned into a production which took place only in connection with circulation, a production which posited exchange values as its exclusive content.

On the other hand, in modern production, where exchange value and developed circulation are presupposed, it is prices which determine production on one side, and production which determines prices on the other.

When it is said that capital 'is accumulated (realized) labour (properly, *objectified* [*vergegenständlichte*] labour), which serves as the means for new labour (production)', [29] then this refers to the simple material of capital, without regard to the formal character without which it is not capital. This means nothing more than that capital is – an instrument of production, for, in the broadest sense, every object, including those furnished purely by nature, e.g. a stone, must first be appropriated by some sort of activity before it can function as an instrument, as means of production. According to this, capital would have existed in all forms of society, and is something altogether unhistorical. Hence every limb of the body is capital, since each of them not only has to be developed through activity, labour, but also nourished, reproduced, in order to be active as an organ. The arm, and especially the hand, are then capital. Capital would be only a new name for a thing as old as the human race, since every form of labour, including the least developed, hunting, fishing, etc., presupposes that the product of prior labour is used as means for direct, living labour. A further characteristic contained in the above definition is that the material stuff of products is entirely abstracted away, and that antecedent labour itself is regarded as its only content (matter); in the same way, abstraction is made from the particular, special purpose for which the making of this product is in its turn intended to serve as means, and merely production in general is posited as purpose. All these things only seemed a work of abstraction, which is equally valid in all social conditions and which merely leads the analysis further and formulates it more abstractly (generally) than is the usual custom. If, then, the specific form of capital is abstracted away, and only the content is emphasized, *as which it is a necessary moment of all labour, then of course nothing is easier than to demonstrate that capital is a necessary condition for all human production.* The proof of this proceeds precisely by abstraction from the specific aspects which make it the moment of a specifically developed *historic* stage of human production. The catch is that if all capital is objectified labour which serves as means for new production, it is not the case that all objectified labour which serves as means for new production is capital. *Capital is conceived as a thing, not as a relation.*

If it is said on the other hand that capital is a sum of values used for the production of values, then this means: capital is self-reproducing exchange value. But, formally, exchange value reproduces itself even in simple circulation. This explanation, it is true, does contain the form wherein exchange value is the point of departure, but the connection with the content (which, with capital, is not, as in the case of simple exchange value, *irrelevant*) is dropped. If it is said that capital is exchange value which produces profit, or at least has the intention of producing a profit, then capital is already presupposed in its explanation, for profit is a specific relation of capital to itself. Capital is not a simple relation, but a *process*, in whose various moments it is always capital. This process therefore to be developed. Already in *accumulated* labour, something has sneaked in, because, in its essential characteristic, it should be merely *objectified* labour, in which, however, a certain amount of labour is accumulated. But accumulated labour already comprises a quantity of objects in which labour is realized.

‘At the beginning everyone was content, since exchange extended only to objects which had no value for each exchanger: no significance was assigned to objects other than those which were without value for each exchanger; no significance was assigned to them, and each was satisfied to receive a useful thing in exchange for a thing without utility. But after the division of labour had made everyone into a merchant and society into a commercial society, no one wanted to give up his products except in return for their equivalents; it thus became necessary, in order to determine this equivalent, to know the *value* of the thing received.’ (Ganilh, 12, b.) [30] This means in other words that exchange did not stand still with the formal positing of exchange values, but necessarily advanced towards the subjection of production itself to exchange value.

(1) Circulation, and exchange value deriving from circulation, the presupposition of capital

To develop the concept of capital it is necessary to begin not with labour but with value, and, precisely, with exchange value in an already developed movement of circulation. It is just as impossible to make the transition directly from labour to capital as it is to go from the different human races directly to the banker, or from nature to the steam engine. We have seen that in money, as such, exchange value has already obtained a form independent of circulation, but only a negative, transitory or, when fixated, an illusory form. It exists only in connection with circulation and as the possibility of entering into it; but it loses this character as soon as it realizes itself, and falls back on its two earlier roles, as measure of exchange value and as medium of exchange. As soon as money is posited as an exchange value which not only becomes independent of circulation, but which also maintains itself through it, then it is no longer money, for this as such does not go beyond the negative aspect, but is *capital*. That money is the first form in which exchange value proceeds to the character of capital, and that, hence, the first *form* in which capital *appears* is confused with capital itself, or is regarded as sole adequate form of capital – this is a historic fact which, far from contradicting our development, rather confirms it. The first quality of capital is, then, this: that exchange value deriving from circulation and presupposing circulation preserves itself within it and by means of it; does not lose itself by entering into it; that circulation is not the movement of its disappearance, but rather the movement of its real self-positing [*Sichsetzen*] as exchange value, its self-realization as exchange value. [31] It cannot be said that exchange value as such is realized in simple circulation. It is always realized only in the moment of its disappearance. If the commodity is exchanged via money for another commodity, then its value-character disappears in the moment in which it realizes itself, and it steps outside the relation, becomes irrelevant to it, merely the direct object of a need. If money is exchanged for a commodity, then even the disappearance of the form of exchange is posited; the form is posited as a merely formal mediation for the purpose of gaining possession of the natural material of the commodity. If a commodity is exchanged for money, then the form of exchange value, exchange value posited as exchange value, money, persists only as long as it stays outside exchange, withdraws from it, is hence a purely illusory realization, purely ideal in this form, in which the independence of exchange value leads a tangible existence. If, finally, money is exchanged for money – the fourth form in which circulation can be analysed, but at bottom only the third form expressed in the form of exchange – then not even a formal difference appears between the things distinguished; a distinction without a difference; not only does exchange value disappear, but also the formal movement of its disappearance. At bottom, these four specific forms of simple circulation are reducible to two, which, it is true, coincide in themselves; the distinction consists in the different placing of the emphasis, the accent; which of the two moments – money and commodity – forms the point of departure. Namely, money for the commodity: i.e. the exchange value of the commodity disappears in favour of its material content (substance); or commodity for money, i.e. its content (substance) disappears in favour of its form as exchange value. In the first case, the form of exchange value is extinguished; in the second, its substance; in both, therefore, its realization is its disappearance. Only with *capital* is exchange value posited as exchange value in such a way that it preserves itself in circulation; i.e. it neither becomes substanceless, nor constantly realizes itself in other substances or a totality of them; nor loses its specific form, but rather preserves its identity with itself in each of the different substances. It therefore always remains money and always commodity. It is in every moment both of the moments which disappear into one another in circulation. But it is this only because it itself is a constantly self-renewing circular course of exchanges. In this relation, too, its circulation is distinct from that of simple exchange values as such. Simple circulation is in fact circulation only from the standpoint of the observer, or *in itself*, not posited as such. It is not always the same exchange value – precisely because its substance is a particular commodity – which first becomes money and then a commodity again; rather, it is always different commodities, different exchange values which confront money. Circulation, the circular path, consists merely of the simple repetition or alternation of the role of commodity and money, and not of the identity of the real point of departure and the point of return. Therefore, in characterizing simple circulation as such, where money alone is the persistent moment, the term mere *money circulation, money turnover* has been applied.

‘Capital values are self-perpetuating.’ (Say, 14.) [32] ‘Capital – permanent’ (‘self-multiplying’ does not belong here as yet) ‘value which no longer decayed; this value tears itself loose from the commodity which created it; like a metaphysical, insubstantial quality, it always remained in the possession of the same *cultivateur*’ (here irrelevant; say *owner*) ‘for whom it cloaked itself in different forms.’ (Sismondi, VI.) [33]

The immortality which money strove to achieve by setting itself negatively against circulation, by withdrawing from it, is achieved by capital, which preserves itself precisely by abandoning itself to circulation. Capital, as exchange value existing prior to circulation, or as presupposing and preserving itself in circulation, not only is in every moment ideally both of the two moments contained in simple circulation, but alternately takes the form of the one and of the other, though no longer merely by passing out of the one into the other, as in simple circulation, but rather by being in each of these roles at the same time a relation to its opposite, i.e. containing it ideally within itself. Capital becomes commodity and money alternately; but (1) *it is itself the alternation of both these roles*; (2) it becomes commodity; but not this or the other commodity, rather a *totality of commodities*. It is not indifferent to the substance, but to the particular form; appears in this respect as a constant metamorphosis of this substance; in so far as it is then posited as a particular content of exchange value, this particularity itself is a totality of particularity; hence indifferent not to particularity as such, but to the single or individuated particularity. The identity, the form of generality [*Allgemeinheit*], which it obtains is that of being exchange value and, as such, money. It is still therefore posited as money, in fact it exchanges itself as commodity for money. But posited as money, i.e. as this contradictory form of the generality of exchange value, there is posited in it at the same time that it must not, as in simple exchange, lose this generality, but must rather lose the attribute antithetical to generality, or adopt it only fleetingly; therefore it exchanges itself again for the commodity, but as a commodity which itself, in its particularity, expresses the generality of exchange value, and hence constantly changes its particular form.

If we speak here of capital, this is still merely a word. The only aspect in which capital is here posited as distinct from direct exchange value and from money is *that of exchange value which preserves and perpetuates itself in and through circulation.* We have so far examined only one side, that of its self-preservation in and through circulation. The other equally important side is that exchange value is *presupposed*, but no longer as simple exchange value, such as it exists as a merely ideal quality of the commodity before it enters into circulation, or as, rather, a merely intended quality, since it becomes exchange value only for a vanishing moment in circulation; nor as exchange value as it exists as a moment in circulation, as money; it exists here, rather, as money, as objectified exchange value, but with the addition of the relation just described. What distinguishes the second from the first is that it (1) exists in the form of objectivity; (2) arises out of circulation, hence presupposes it, but at the same time proceeds from itself as presupposition of circulation.

There are two sides in which the result of simple circulation can be expressed:

The simply negative: The commodities thrown into circulation have achieved their purpose; they are exchanged for one another; each becomes an object of a need and is consumed. With that, circulation comes to an end. Nothing remains other than money as simple residue. As such a residue, however, it has ceased to be money, loses its characteristic form. It collapses into its material, which is left over as the inorganic ashes of the process as a whole.

The positively negative: Money is negated not as objectified, independent exchange value – not only as vanishing in circulation – but rather the *antithetical* independence, the merely abstract generality in which it has firmly settled, is negated; but

thirdly: Exchange value as the presupposition and simultaneously the result of circulation, just as it is assumed as having emerged from circulation, must emerge from it again. If this happens in a merely formal manner, it would simply become money again; if it emerges as a real commodity, as in simple circulation, then it would become a simple object of need, consumed as such, and again lose its quality as form. For this emergence to become real, it must likewise become the object of a need and, as such, be consumed, but it must be consumed by labour, and thereby reproduce itself anew.

Differently expressed: Exchange value, as regards its content, was originally an objectified amount of labour or labour time; as such it passed through circulation, in its objectification, until it became money, tangible money. It must now again posit the point of departure of circulation, which lay outside circulation, was presupposed to it, and for which circulation appeared as an external, penetrating and internally transforming movement; this point was labour; but [it must do so] now no longer as a simple equivalent or as a simple objectification of labour, but rather as objectified exchange value, now become independent, which yields itself to labour, becomes its material, only so as to renew itself and to begin circulating again by itself. And with that it is no longer a simple positing of equivalents, a preservation of its identity, as in circulation; but rather *multiplication* of itself. Exchange value posits itself as exchange value only by realizing itself; i.e. increasing its value. *Money* (as returned to itself from circulation), *as capital, has lost its rigidity, and from a tangible thing has become a process.* But at the same time, labour has changed its relation to its objectivity; it, too, has returned to itself. But the nature of the return is this, that the labour objectified in the exchange value posits living labour as a means of reproducing it, whereas, originally, exchange value appeared merely as a product of labour.

Exchange value emerging from circulation, a presupposition of circulation, preserving and multiplying itself in it by means of labour

<[34] I. (1) General concept of capital. – (2) Particularity of capital: circulating capital, fixed capital. (Capital as the necessaries of life, as raw material, as instrument of labour.) (3) Capital as money. II. (1) *Quantity of capital. Accumulation.* (2) *Capital measured by itself. Profit. Interest. Value of capital*: i.e. capital as distinct from itself as interest and profit. (3) *The circulation of capitals.* (α) Exchange of capital and capital. Exchange of capital with revenue. Capital and *prices*. (β) *Competition of capitals*. (γ) *Concentration of capitals*. III. Capital as credit. IV. Capital as share capital. V.

Capital as money market. VI. Capital as source of wealth. The capitalist. After capital, landed property would be dealt with. After that, wage labour. All three presupposed, the *movement of prices*, as circulation now defined in its inner totality. On the other side, the three classes, as production posited in its three basic forms and presuppositions of circulation. Then the *state*. (State and bourgeois society. – Taxes, or the existence of the unproductive classes. – The state debt. – Population. – The state externally: colonies. External trade. Rate of exchange. Money as international coin. – Finally the world market. Encroachment of bourgeois society over the state. Crises. Dissolution of the mode of production and form of society based on exchange value. Real positing of individual labour as social and vice versa.)>

Product and capital. Value and capital. Proudhon

(Nothing is more erroneous than the manner in which economists as well as socialists regard *society* in relation to economic conditions. Proudhon, for example, replies to Bastiat by saying (XVI, 29): '*For society*, the difference between capital and product does not exist. This difference is entirely *subjective*, and related to individuals.' [35] Thus he calls subjective precisely what is social; and he calls society a subjective abstraction. The difference between product and capital is exactly this, that the product expresses, as capital, a particular relation belonging to a historic form of society. This so-called contemplation from the standpoint of society means nothing more than the overlooking of the *differences* which express the *social relation* (relation of bourgeois society). Society does not consist of individuals, but expresses the sum of interrelations, the relations within which these individuals stand. As if someone were to say: Seen from the perspective of society, there are no slaves and no citizens: both are human beings. Rather, they are that outside society. To be a slave, to be a citizen, are social characteristics, relations between human beings A and B. Human being A, as such, is not a slave. He is a slave in and through society. What Mr Proudhon here says about capital and product means, for him, that from the viewpoint of society there is no difference between capitalists and workers; a difference which exists precisely only from the standpoint of society.)

(For Proudhon in his polemic against Bastiat, ‘*Gratuité du crédit*’, everything comes down to his own wish to reduce the exchange between capital and labour to the simple exchange of commodities as exchange values, to the moments of simple circulation, i.e. he abstracts from just the specific difference on which everything depends. He says: ‘At a given moment, every product becomes capital, because everything which is consumed is at a given moment consumed reproductively.’ This very false, but never mind. ‘What is it that makes the motion of the product suddenly transform itself into that of capital? It is the *idea of value*. That means that the product, in order to become capital, needs to have passed through an authentic evaluation, to have been bought or sold, its price debated and fixed by a sort of legal convention. E.g. leather, coming from the slaughterhouse, is the product of the butcher. Is this leather bought by the tanner? The latter then immediately carries it or carries its value into his exploitation fund [*fonds d’exploitation*]. By means of the tanner’s labour, this capital becomes product again etc.’ [36] Every capital is here ‘*a constituted value*’. Money is the ‘*most perfect value*’, [37] *constituted value* to the highest power. This means, then: (1) Product becomes capital by becoming value. Or capital is just nothing more than simple value. There is no difference between them. Thus he says commodity (the natural side of the same, expressed as product) at one time, value another time, alternatively, or rather, since he presupposes the act of buying and selling, price. (2) Since money appears as the perfected form of value such as it is in simple circulation, therefore money is also the true *constituted value*.)

Capital and labour. Exchange value and use value for exchange value. – Money and its use value (labour) in this relation, capital. Self-multiplication of value is its only movement. – The phrase that no capitalist will employ his capital without drawing a gain from it. – Capital, as regards substance, objectified labour. Its antithesis, living, productive (i.e. value-preserving and value-increasing) labour. – Productive labour and labour as performance of a service. – Productive and unproductive labour. A. Smith etc. – Thief in Lauderdale’s sense and productive labour

The transition from simple exchange value and its circulation to capital can also be expressed in this way: Within circulation, exchange value appears double: once as commodity, again as money. If it is in one aspect, it is not in the other. This holds for every particular commodity. But the wholeness of circulation, regarded in itself, lies in the fact that the same exchange value, exchange value as subject, posits itself once as commodity, another time as money, and that it is just this movement of positing itself in this dual character and of preserving itself in each of them as its opposite, in the commodity as money and in money as commodity. This in itself is present in simple circulation, but is not posited in it. Exchange value posited as the unity of commodity and money is *capital*, and this positing itself appears as the circulation of capital. (Which is, however, a spiral, an expanding curve, not a simple circle.)

Let us analyse first the simple aspects contained in the relation of capital and labour, in order by this means to arrive at the inner connection not only of these aspects, but also of their further development from the earlier ones.

The first presupposition is that capital stands on one side and labour on the other, both as independent forms relative to each other; both hence also alien to one another. The labour which stands opposite capital is *alien* [*fremde*] labour, and the capital which stands opposite labour is *alien* capital. The extremes which stand opposite one another are *specifically* different. In the first positing of simple exchange value, labour was structured in such a way that the product was not a direct use value for the labourer, not a direct means of subsistence. This was the general condition for the creation of an exchange value and of exchange in general. Otherwise the worker would have produced only a product – a direct use value for himself – but not an exchange value. This exchange value, however, was materialized in a product which had, as such, a use value for others, and, as such, was the object of their needs. The use value which the worker has to offer to the capitalist, which he has to offer to others in general, is not materialized in a product, does not exist apart from him at all, thus exists not really, but only in potentiality, as his capacity. It becomes a reality only when it has been solicited by capital, is set in motion, since activity without object is nothing, or, at the most, mental activity, which is not the question at issue here. As soon as it has obtained motion from capital, this use value exists as the worker's specific, productive activity; it is his vitality itself, directed toward a specific purpose and hence expressing itself in a specific form.

In the relation of capital and labour, exchange value and use value are brought into relation; the one side (capital) initially stands opposite the other side as *exchange value*, * and the other (labour), stands opposite capital, as use value. In simple circulation, each of the commodities can alternately be regarded in one or the other role. In both cases, when it counts as commodity as such, it steps outside circulation as object of a need and falls entirely outside the economic relation. In so far as the commodity becomes fixed as exchange value – money – it tends towards the same formlessness, but as falling within the economic relation. In any case, the commodities are of interest in the exchange-value relation (simple circulation) only in so far as they have exchange value; on the other side their exchange value is of only passing interest, in that it suspends the one-sidedness – the usefulness, use value, existing only for the specific individual, hence existing *directly* for him – but not this use value itself; rather, it posits and mediates it as use value for others etc. But to the degree that exchange value as such becomes fixed in money, use value no longer confronts it as anything but abstract chaos; and, through just this separation from its substance, it collapses into itself and tends away from the sphere of simple exchange value, whose highest movement is simple circulation, and whose highest perfection is money. But within the sphere itself, the distinctness exists in fact only as a superficial difference, a purely formal distinction. Money itself in its highest fixedness is itself a commodity again, and distinguishes itself from the others only in that it expresses exchange value more *perfectly*; but, as currency, and precisely for that reason, it loses its *exchange value* as intrinsic quality, and becomes *mere* use value, although admittedly use value for determining the prices etc. of commodities. The aspects still immediately coincide and just as immediately they separate. Where they relate to one another independently, *positively*, as in the case of the commodity which becomes an object of consumption, it ceases to be a moment of the economic process; where negatively, as in the case of money, it becomes *madness*; madness, however, as a moment of economics and as a determinant of the practical life of peoples.

---

* Is not *value* to be conceived as the unity of use value and exchange value? In and for

> itself, is value as such the general form, in opposition to use value and exchange value as *particular* forms of it? Does this have significance in economics? Use value presupposed even in simple exchange or barter. But here, where exchange takes place only for the reciprocal use of the commodity, the use value, i.e. the content, the natural particularity of the commodity has as such no standing as an economic form. Its form, rather, is exchange value. The content apart from this form is irrelevant; is not a content of the relation as a social relation. But does this content as such not develop into a system of needs and production? Does not use value as such enter into the form itself, as a determinant of the form itself, e.g. in the relation of capital and labour? the different forms of labour? – agriculture, industry etc. – ground rent? – effect of the seasons on raw product prices? etc. If *only* exchange value as such plays a role in economics, then how could elements later enter which relate purely to use value, such as, right away, in the case of capital as raw material etc.? How is it that the physical composition of the soil suddenly drops out of the sky in Ricardo? [38] The word *ware* [commodity] (German *Güter* [goods] perhaps as *denrée* [good] as distinct from *marchandise* [commodity]?) contains the connection. The price appears as a merely formal aspect in it. This is not in the slightest contradicted by the fact that exchange value is the predominant aspect. But of course use does not come to a halt because it is determined *only* by exchange; although of course it obtains its direction thereby. In any case, this is to be examined with exactitude in the examination of value, and not, as Ricardo does, to be entirely abstracted from, nor like the dull Say, who puffs himself up with the mere presupposition of the word ‘utility’. [39] Above all it will and must become clear in the development of the individual sections to what extent use value exists not only as presupposed matter, outside economics and its forms, but to what extent it enters into it. Proudhon’s nonsense, see the ‘Misère’. [40] This much is certain: in exchange we have (in circulation) the commodity – use value – as price; that it is, apart from its price, a commodity, an object of need, goes without saying. The two aspects in no way enter into relation with each other, except in so far as the particular use value appears as the natural limit of the commodity and hence posits money, i.e. its exchange value, simultaneously as an existence apart from itself, in money, but only formally. Money itself is a commodity, has a use value for its substance.

We have seen earlier that it cannot be said that exchange value is realized in simple circulation. [41] This is so, however, because use value does not stand as such opposite exchange value, as something defined as use value by exchange value; while inversely use value as such does not stand in a connection with exchange value, but becomes a specific exchange value only because the common element of use values – labour time – is applied to it as an external yardstick. Their unity still immediately splits, and their difference still immediately coincides. It must now be posited that use value as such becomes what it becomes through exchange value, and that exchange value mediates itself through use value. In money circulation, all we had was the different forms of exchange value (price of the commodity – money) or only different use values (commodity – C), for which money, exchange value, is merely a vanishing mediation. A real connection of exchange value and use value did not take place. The commodity as such – its particularity – is for that reason an irrelevant, merely accidental, and in general imaginary content, which falls outside the relation of economic forms; or, the latter is a merely superficial form, a formal quality: the real substance lies outside its realm and stands in no relation at all to the substance as such; therefore if this formal quality as such becomes fixed in money, then it transforms itself on the sly into an irrelevant natural product, a metal, in which every trace of a connection, whether with the individual or with intercourse between individuals, is extinguished. Metal as such of course expresses no social relations; the coin form is extinguished in it as well; the last sign of life of its social significance.

Posited as a side of the relation, exchange value, which stands opposite use value itself, confronts it as money, but the money which confronts it in this way is no longer money in its character as such, but money as *capital*. The *use value* or commodity which confronts capital or the posited *exchange value* is no longer the commodity such as it appeared in opposition to money, where its specific form was as irrelevant as its content, and which appeared only as a completely undefined substance. First, as use value for capital, i.e. therefore as an object in exchange with which capital does not lose its value-quality, as for example does money when it is exchanged for a particular commodity. The only utility whatsoever which an object can have for capital can be to preserve or increase it. We have already seen, in the case of money, how value, having become independent as such – or the general form of wealth – is capable of no other motion than a quantitative one; to increase itself. It is according to its concept the quintessence of all use values; but since it is always only a definite amount of money (here, capital), its quantitative limit is in contradiction with its quality. It is therefore inherent in its nature constantly to drive beyond its own barrier. (As consumption-oriented wealth, e.g. in imperial Rome, it therefore appears as limitless waste, which logically attempts to raise consumption to an imaginary boundlessness, by gulping down salad of pearls etc.) Already for that reason, value which insists on itself as value preserves itself through increase; and it preserves itself precisely only by constantly driving beyond its quantitative barrier, which contradicts its character as form, its inner generality. Thus, growing wealthy is an end in itself. The goal-determining activity of capital can only be that of growing wealthier, i.e. of magnification, of increasing itself. A specific sum of money (and money always exists for its owner in a specific quantity, always as a specific sum of money) (this is to be developed as early as in the money chapter) can entirely suffice for a specific consumption, in which it ceases to be money. But as a representative of general wealth, it cannot do so. As a quantitatively specific sum, a limited sum, it is only a limited representative of general wealth, or representative of a limited wealth, which goes as far, and no further than, its exchange value, and is precisely measured in it. It thus does not by any means have the capacity which according to its general concept it ought to have, namely the capacity of buying all pleasures, all commodities, the totality of the material substances of wealth; it is not a ‘*précis de toutes les choses*’ [42] etc. Fixed as wealth, as the general form of wealth, as value which counts as value, it is therefore the constant drive to go beyond its quantitative limit: an endless process. Its own animation consists exclusively in that; it *preserves* itself as a self-validated exchange value distinct from a use value only by *constantly multiplying* itself. (It is damned difficult for Messrs the economists to make the theoretical transition from the self-preservation of value in capital to its multiplication; and this in its fundamental character, not only as an accident or result. See e.g. Storch, how he brings this fundamental character in with an adverb, ‘properly’. [43] Admittedly, the economists try to introduce this into the relation of capital as an essential aspect, but if this is not done in the brutal form of defining capital as that which brings profit, where the increase of capital itself is already posited as a special *economic* form, profit, then it happens only surreptitiously, and very feebly, as we shall later show in a brief review of all that the economists have contributed towards determining the concept of capital. Drivel to the effect that nobody would employ his capital without drawing a gain from it [44] amounts either to the absurdity that the good capitalists will remain capitalists even *without* employing their capital; or to a very banal form of saying that gainful investment is inherent in the concept of capital. Very well. In that case it would just have to be demonstrated.) – Money as a sum of money is measured by its quantity. This measuredness contradicts its character, which must be oriented towards the measureless. Everything which has been said here about money holds even more for capital, in which money actually develops in its completed character for the first time. The only use value, i.e. usefulness, which can stand opposite capital as such is that which increases, multiplies and hence preserves it as capital.

Secondly. Capital is by definition money, but not merely money in the simple form of gold and silver, nor merely as money in opposition to circulation, but in the form of all substances – commodities. To that degree, therefore, it does not, as capital, stand in opposition to use value, but exists apart from money precisely only in use values. These, its substances themselves, are thus now transitory ones, which would have no exchange value if they had no use value; but which lose their value as use values and are dissolved by the simple metabolism of nature if they are not actually used, and which disappear even more certainly if they are actually used. In this regard, the opposite of capital cannot itself be a particular commodity, for as such it would form no opposition to capital, since the substance of capital is itself use value; it is not this commodity or that commodity, but all commodities. The communal substance of all commodities, i.e. their substance not as material stuff, as physical character, but their communal substance as *commodities* and hence *exchange values*, is this, that they are *objectified labour*. * The only thing distinct from *objectified* labour is *non-objectified* labour, labour which is still objectifying itself, *labour* as subjectivity. Or, *objectified* labour, i.e. labour which is *present in space*, can also be opposed, as *past labour*, to labour which is *present in time*. If it is to be present in time, alive, then it can be present only as the *living subject*, in which it exists as capacity, as possibility; hence as *worker*. The only *use value,* therefore, which can form the opposite pole to capital is *labour (to be exact, value-creating, productive labour.* This marginal remark is an anticipation; must first be developed, by and by. Labour as mere performance of services for the satisfaction of immediate needs has nothing whatever to do with capital, since that is not capital’s concern. If a capitalist hires a woodcutter to chop wood to roast his mutton over, then not only does the wood-cutter relate to the capitalist, but also the capitalist to the wood-cutter, in the relation of simple exchange. The woodcutter gives him his service, a use value, which does not increase capital; rather, capital consumes itself in it; and the capitalist gives him another commodity for it in the form of money. The same relation holds for all services which workers exchange directly for the money of other persons, and which are consumed by these persons. This is consumption of revenue, which, as such, always falls within simple circulation; it is not consumption of capital. Since one of the contracting parties does not confront the other as a capitalist, this performance of a service cannot fall under the category of productive labour. From whore to pope, there is a mass of such rabble. But the honest and ‘working’ lumpenproletariat belongs here as well; e.g. the great mob of porters etc. who render service in seaport cities etc. He who represents money in this relation demands the service only for its use value, which immediately vanishes for him; but the porter demands money, and since the party with money is concerned with the commodity and the party with the commodity, with money, it follows that they represent to one another no more than the two sides of simple circulation; goes without saying that the porter, as the party concerned with money, hence directly with the general form of wealth, tries to enrich himself at the expense of his improvised friend, thus injuring the latter’s self-esteem, all the more so because he, a hard calculator, has need of the service not *qua capitalist* but as a result of his ordinary human frailty. A. Smith was *essentially* correct with his *productive* and *unproductive* labour, correct from the standpoint of bourgeois economy. [45] What the other economists advance against it is either horse-piss (for instance Storch, Senior even lousier etc.), [46] namely that every action after all acts upon something, thus confusion of the product in its natural and in its economic sense; so that the pickpocket becomes a productive worker too, since he indirectly produces books on criminal law (this reasoning at least as correct as calling a judge a productive worker because he protects *from* theft). Or the modern economists have turned themselves into such sycophants of the bourgeois that they want to demonstrate to the latter that it is productive labour when somebody picks the lice out of his hair, or strokes his tail, because for example the latter activity will make his fat head – blockhead – clearer the next day in the office. It is therefore quite correct – but also characteristic – that for the consistent economists the workers in e.g. luxury shops are productive, although the characters who consume such objects are expressly castigated as unproductive wastrels. The fact is that these workers, indeed, are productive, as far as they increase the capital of their master; unproductive as to the material result of their labour. In fact, of course, this 'productive' worker cares as much about the crappy shit he has to make as does the capitalist himself who employs him, and who also couldn't give a damn for the junk. But, looked at more precisely, it turns out in fact that the true definition of a productive worker consists in this: A person who needs and demands exactly as much as, and no more than, is required to enable him to gain the greatest possible benefit for his capitalist. All this nonsense. Digression. But return in more detail to the productive and unproductive).

> * But only this economic (social) substance of use values, i.e. of their economic character as content as distinct from their form (but this form *value*, because specific amount of this *labour*), comes into question when searching for an antithesis to capital. As far as their natural differences are concerned, none of them excludes capital from entering into them and making their bodies its own, so long as none excludes the character of exchange value and of the commodity.

The two different processes in the exchange of capital with labour. (Here the use value of that which is exchanged for capital belongs to the specific economic form etc.)

The use value which confronts capital as posited exchange value is *labour*. Capital exchanges itself, or exists in this role, only in connection with *not-capital*, the negation of capital, without which it is not capital; the real *not-capital* is labour.

If we consider the exchange between capital and labour, then we find that it splits into two processes which are not only formally but also qualitatively different, and even contradictory:

(1) The worker sells his commodity, labour, which has a use value, and, as commodity, also a *price*, like all other commodities, for a specific sum of exchange values, specific sum of money, which capital concedes to him.

(2) The capitalist obtains labour itself, labour as value-positing activity, as

productive labour; i.e. he obtains the productive force which maintains and multiplies capital, and which thereby becomes the productive force, the reproductive force of capital, a force belonging to capital itself.

The separation of these two processes is so obvious that they can take place at different times, and need by no means coincide. The first process can be and usually, to a certain extent, is completed before the second even begins. The completion of the second act presupposes the completion of the product. The payment of wages cannot wait for that. We will even find it an essential aspect of the relation, that it does not wait for that.

In simple exchange, circulation, this double process does not take place. If commodity A is exchanged for money B, and the latter then for the commodity C, which is destined to be consumed – the original object of the exchange, for A – then the using-up of commodity C, its consumption, falls entirely outside circulation; is irrelevant to the form of the relation; lies beyond circulation itself, and is of purely physical interest, expressing no more than the relation of the individual A in his natural quality to an object of his individual need. What he does with commodity C is a question which belongs outside the economic relation. Here, by contrast, *the use value of that which is exchanged for money appears as a particular economic relation, and the specific utilization of that which is exchanged for money forms the ultimate aim of both processes. Therefore, this is already a distinction of form between the exchange of capital and labour, and simple exchange – two different processes.*

If we now further inquire how the exchange between capital and labour is different in content from simple exchange (circulation), then we find that this difference does not arise out of an external connection or equation; but rather that, in the totality of the latter process, the second form distinguishes itself from the first, in that this equation is itself comprised within it. The difference between the second act and the first – note that the particular process of the appropriation of labour by capital is the second act – is exactly the difference between the exchange of capital and labour, and exchange between commodities as it is mediated by money. *In the exchange between capital and labour, the first act is an exchange, falls entirely within ordinary circulation; the second is a process qualitatively different from* *exchange, and only by misuse* could it have been called *any sort of exchange at all.* It stands directly opposite exchange; essentially different category.

Capital and modern landed property. – Wakefield

<*Capital.* I. *Generality*: (1) (a) Emergence of capital out of money. (b) Capital and labour (mediating itself through *alien* labour). (c) The elements of capital, dissected according to their relation to labour (Product. Raw material. Instrument of labour.) (2) *Particularization of capital*: (a) Capital circulant, capital fixe. Turnover of capital. (3) *The singularity of capital*: Capital and profit. Capital and interest. Capital as *value*, distinct from itself as interest and profit. II. *Particularity*: (1) Accumulation of capitals. (2) Competition of capitals. (3) Concentration of capitals (quantitative distinction of capital as at same time qualitative, as *measure* of its size and influence). III. *Singularity*: (1) Capital as credit. (2) Capital as stock-capital. (3) Capital as money market. In the money market, capital is posited in its totality; there it *determines prices, gives work, regulates production,* in a word, is the *source of production*; but capital, not only as something which produces itself (positing prices materially in industry etc., developing forces of production), but at the same time as a creator of values, has to posit a value or form of wealth specifically distinct from capital. This is *ground rent.* This is the only value created by capital which is distinct from itself, from its own production. By its nature as well as historically, capital is the *creator* of modern landed property, of ground rent; just as its action therefore appears also as the dissolution of the old form of property in land. The new arises through the action of capital upon the old. Capital is this – in one regard – as creator of modern agriculture. The inner construction of modern society, or, capital in the totality of its relations, is therefore posited in the economic relations of modern landed property, which appears as a process: ground rent – capital – wage labour (the form of the circle can also be put in another way: as wage labour – capital – ground rent; but capital must always appear as the active middle). The question is now, how does the transition from landed property to wage labour come about? (The transition from wage labour to capital arises by itself, since the latter is here brought back

into its active foundation.) Historically, this transition is beyond dispute. It is already given in the fact that landed property is the product of capital. We therefore always find that, wherever landed property is transformed into money rent through the reaction of capital on the older forms of landed property (the same thing takes place in another way where the modern farmer is created) and where, therefore, at the same time agriculture, driven by capital, transforms itself into industrial agronomy, there the cottiers, serfs, bondsmen, tenants for life, cottagers etc. become day labourers, wage labourers, i.e. that *wage labour* in its totality is initially created by the action of capital on landed property, and then, as soon as the latter has been produced as a form, by the proprietor of the land himself. This latter himself then 'clears', as Steuart says, [47] the land of its excess mouths, tears the children of the earth from the breast on which they were raised, and thus transforms labour on the soil itself, which appears by its nature as the direct wellspring of subsistence, into a mediated source of subsistence, a source purely dependent on social relations. (The reciprocal dependence has first to be produced in its pure form before it is possible to think of a real social communality [*Gemeinschaftlichkeit*]. All relations as posited by society, not as determined by nature.) Only in this way is the application of science possible for the first time, and the development of the full force of production. There can therefore be no doubt that *wage labour* in its *classic form,* as something permeating the entire expanse of society, which has replaced the very earth as the ground on which society stands, is initially created only by modern landed property, i.e. by landed property as a value created by capital itself. This is why landed property leads back to wage labour. In one regard, it is nothing more than the extension of wage labour, from the cities to the countryside, i.e. wage labour distributed over the entire surface of society. The ancient proprietor of land, if he is rich, needs no capitalist in order to become the modern proprietor of land. He needs only to transform his workers into wage workers and to produce for profit instead of for revenue. Then the modern farmer and the modern landowner are presupposed in his person. This change in the form in which he obtains his revenue or in the form in which the worker is paid is not, however, a formal distinction, but presupposes *a total restructuring of the mode of production* (agriculture) itself; it therefore presupposes conditions which rest on a certain development of industry, of trade, and of science, in short of the forces of production. Just as, in general, production resting on capital and wage labour differs from other modes of production not merely formally, but equally presupposes a total revolution and development of material production. Although capital can develop itself completely as commercial capital (only not as much quantitatively), without this transformation of landed property, it cannot do so as industrial capital. Even the development of manufactures presupposes the beginning of a dissolution of the old economic relations of landed property. On the other hand, only with the development of modern industry to a high degree does this dissolution at individual points acquire its totality and extent; but this development itself proceeds more rapidly to the degree that modern agriculture and the form of property, the economic relations corresponding to it, have developed. Thus England in this respect the model country for the other continental countries. Likewise: if the first form of industry, large-scale manufacture, already presupposes dissolution of landed property, then the latter is in turn conditioned by the subordinate development of capital in its primitive (medieval) forms which has taken place in the cities, and at the same time by the effect of the flowering of manufacture and trade in other countries (thus the influence of Holland on England in the sixteenth and the first half of the seventeenth century). These countries themselves had already undergone the process, agriculture had been sacrificed to cattle-raising, and grain was obtained from countries which were left behind, such as Poland etc., by import (Holland again). It must be kept in mind that the new forces of production and relations of production do not develop out of *nothing*, nor drop from the sky, nor from the womb of the self-positing Idea; but from within and in antithesis to the existing development of production and the inherited, traditional relations of property. While in the completed bourgeois system every economic relation presupposes every other in its bourgeois economic form, and everything posited is thus also a presupposition, this is the case with every organic system. This organic system itself, as a totality, has its presuppositions, and its development to its totality consists precisely in subordinating all elements of society to itself, or in creating out of it the organs which it still lacks. This is historically how it becomes a totality. The process of becoming this totality forms a moment of its process, of its development. – On the other hand, if within one society the modern relations of production, i.e. capital, are developed to its totality, and this society then seizes hold of a new territory, as e.g. the colonies, then it finds, or rather its representative, the capitalist, finds, that his capital ceases to be capital without wage labour, and that one of the presuppositions of the latter is not only landed property in general, but modern landed property; landed property which, as capitalized rent, is expensive, and which, as such, excludes the direct use of the soil by individuals. Hence Wakefield's theory of colonies, followed in practice by the English government in Australia. [48] Landed property is here artificially made more expensive in order to transform the workers into wage workers, to make capital act as capital, and thus to make the new colony productive; to develop wealth in it, instead of using it, as in America, for the momentary deliverance of the wage labourers. Wakefield's theory is infinitely important for a correct understanding of modern landed property. – Capital, when it creates landed property, therefore goes back to the production of wage labour as its general creative basis. Capital arises out of circulation and posits labour as wage labour; takes form in this way; and, developed as a whole, it posits landed property as its precondition as well as its opposite. It turns out, however, that it has thereby only created wage labour as its general presupposition. The latter must then be examined by itself. On the other hand, modern landed property itself appears most powerfully in the process of clearing the estates and the transformation of the rural labourers into wage labourers. Thus a double transition to wage labour. This on the positive side. Negatively, after capital has posited landed property and hence arrived at its double purpose: (1) industrial agriculture and thereby development of the forces of production on the land; (2) wage labour, thereby general domination of capital over the countryside; it then regards the existence of landed property itself as a merely transitional development, which is required as an action of capital on the old relations of landed property, and a *product of their decomposition*; but which, as such – once this purpose achieved – is merely a limitation on profit, not a necessary requirement for production. It thus endeavours to dissolve landed property as private property and to transfer it to the state. This the negative side. Thus to transform the entire domestic society into capitalists and wage labourers. When capital has reached this point, then wage labour itself reaches the point where, on one side, it endeavours to remove the landowner as an excrescence, to simplify the relation, to lessen the burden of taxes etc., in the same form as the bourgeois; on the other hand, in order to escape wage labour and to become an independent producer – for immediate consumption – it demands the breaking-up of large landed property. Landed property is thus negated from two sides; the negation from the side of capital is only a change of form, towards its undivided rule. (Ground rent as the universal state rent (state tax), so that bourgeois society reproduces the medieval system in a new way, but as the latter's total negation.) The negation from the side of wage labour is only concealed negation of capital, hence of itself as well. It must now be regarded as independent in respect to capital. Thus the transition double: (1) *Positive transition* from modern landed property, or from capital through the mediation of modern landed property, to general wage labour; (2) *negative transition*: negation of landed property by capital, i.e. thus negation of autonomous value by capital, i.e. precisely negation of capital by itself. But its negation is *wage labour*. Then negation of landed property and, through its mediation, of capital, on the part of wage labour, i.e. on the part of wage labour which wants to posit itself as independent.>

<The *market*, which appears as an abstract quality at the beginning of economics, takes on total shapes. First, the *money market*. This includes the discount market; in general, the loan market; hence money trade, bullion market. As *money-lending market* it appears in the banks, for instance the discount at which they discount: loan market, billbrokers etc.; but then also as the market in all *interest-bearing bills*: state funds and the share market. The latter separate off into larger groups (first the *shares of money institutions* themselves; bank shares; joint-stock bank shares; *shares* in the means of communication (*railway shares* the most important; *canal* shares; steam navigation shares, telegraph shares, omnibus shares); *shares of general industrial enterprises (mining shares* the chief ones). Then in the supply of common elements (*gas* shares, water-supply shares). *Miscellaneous* shares of a thousand kinds. For the *storage of commodities* (dock shares etc.). *Miscellaneous* in infinite variety, such as enterprises in industry or trading companies founded on shares. Finally, as security for the whole, *insurance shares* of all kinds.) Now, just as the market by and large is divided into home

market and foreign market, so the internal market itself again divides into the market of home shares, national funds etc. and foreign funds, foreign shares etc. This development actually belongs properly under the world market, which is not only the internal market in relation to all foreign markets existing outside it, but at the same time the internal market of all foreign markets as, in turn, components of the home market. *The concentration of the money market* in a chief location within a country, while the other markets are more distributed according to the division of labour; although here, too, great concentration in the capital city, if the latter is at the same time a port of export. – The various markets other than the money market are, firstly, as different as are products and branches of production themselves. The chief markets in these various products arise in centres which are such either in respect of import or export, or because they are either themselves centres of a given production, or are the direct supply points of such centres. But these markets proceed from this simple difference to a more or less organic separation into large groups, which themselves necessarily divide up according to the basic elements of capital itself: product market and raw-material market. The instrument of production as such does not form a separate market; it exists as such chiefly, first, in the raw materials themselves which are sold as means of production; then, however, in particular in the metals, since these exclude all thought of direct consumption, and then the products, such as coal, oil, chemicals, which are destined to disappear as auxiliary means of production. Likewise dyes, wood, drugs etc. Hence:

I. *Products.* (1) *Grain market* with its various subdivisions. E.g. seed market: rice, sage, potatoes etc. This very important economically; at the same time market for production and for direct consumption. (2) *Colonial-produce market*. Coffee, tea, cocoa, sugar; spices (pepper, tobacco, pimento, cinnamon, cassia lignea, cloves, ginger, mace, nutmegs, etc.). (3) *Fruits*. Almonds, currants, figs, plums, prunes, raisins, oranges, lemons etc. *Molasses* (for production etc.). (4) *Provisions*. Butter; cheese; bacon; hams; lard; pork; beef (smoked), fish etc. (5) *Spirits.* Wine, rum, beer etc. II. *Raw Materials*. (1) *Raw materials for mechanical industry.* Flax; hemp; cotton; silk; wool; hides; leather; gutta-percha etc. (2) *Raw materials for chemical industry.* Potash, saltpetre; turpentine; nitrate of soda etc. III. *Raw materials which at* *the same time instruments of production. Metals* (copper, iron, tin, zinc, lead, steel etc.), *wood*. Lumber. Timber. Dye-woods. Specialized wood for shipbuilding etc. *Accessory means of production and raw materials*. Drugs and dyes. (Cochineal, indigo etc. Tar. Tallow. Oil. Coals etc.) Of course, every product must go to market, but really great markets, as distinct from retail trade, are formed only by the great consumption goods (economically important are only the grain market, the tea, the sugar, the coffee market (wine market to some extent, and market in spirits generally), or those which are raw materials of industry: wool, silk, wood, metal market etc.) To be seen at what point the abstract category of the market has to be brought in.>

Exchange between capital and labour. Piecework wages. – Value of labour power. – Share of the wage labourer in general wealth determined only quantitatively. – The worker's equivalent, money. Thus confronts capital as equal. – But aim of his exchange satisfaction of his need. Money for him only* medium of circulation. – *Savings, self-denial as means of the worker's enrichment. – Valuelessness and devaluation of the worker a condition of capital

The exchange between the worker and the capitalist is a simple exchange; each obtains an equivalent; the one obtains money, the other a commodity whose *price* is exactly equal to the money paid for it; what the capitalist obtains from this simple exchange is a use value: disposition over alien labour. From the worker's side – and service is the exchange in which he appears as seller – it is evident that the use which the buyer makes of the purchased commodity is as irrelevant to the specific form of the relation here as it is in the case of any other commodity, of any other use value. What the worker sells is the disposition over his labour, which is a specific one, specific skill etc.

What the capitalist does with his labour is completely irrelevant, although of course he can use it only in accord with its specific characteristics, and his disposition is restricted to a *specific* labour and is *restricted in time* (so much labour time). The piece-work system of payment, it is true, introduces the semblance that the worker obtains a specified share of the product. But this is only another form of measuring time (instead of saying, you will work for 12 hours, what is said is, you get so much per piece; i.e. we measure the time you have worked by the number of products); it is here, in the examination of the general relation, altogether beside the point. If the capitalist were to content himself with merely the capacity of disposing, without actually making the worker work, e.g. in order to have his labour as a reserve, or to deprive his competitor of this capacity of disposing (like e.g. theatre directors who buy singers for a season not in order to have them sing, but so that they do not sing in a competitor's theatre), then the exchange has taken place in full. True, the worker receives money, hence exchange value, the general form of wealth, in one or another quantity; and the more or less he receives, the greater or the lesser is the share in the general wealth he thus obtains. How this more or less is determined, how the quantity of money he receives is measured, is of so little relevance to the general relation that it cannot be developed out of the latter. In general terms, the exchange value of his commodity cannot be determined by the manner in which its buyer uses it, but only by the amount of objectified labour contained in it; hence, here, by the amount of labour required to reproduce the worker himself. For the use value which he offers exists only as an ability, a capacity [*Vermögen*] of his bodily existence; has no existence apart from that. The labour objectified in that use value is the objectified labour necessary bodily to maintain not only the general substance in which his labour power exists, i.e. the worker himself, but also that required to modify this general substance so as to develop its particular capacity. This, in general terms, is the measure of the amount of value, the sum of money, which he obtains in exchange. The further development, where wages are measured, like all other commodities, by the labour time necessary to produce the worker as such, is not yet to the point here. Within circulation, if I exchange a commodity for money, buy a commodity for it and satisfy my need, then the act is at an end. Thus it is with the worker. But he has the possibility of beginning it again from the beginning because his life is the source in which his own use value constantly rekindles itself up to a certain time, when it is worn out, and constantly confronts capital again in order to begin the same exchange anew. Like every individual subject within circulation, the worker is the owner of a use value; he exchanges this for money, for the general form of wealth, but only in order to exchange this again for commodities, considered as the objects of his immediate consumption, as the means of satisfying his needs. Since he exchanges his use value for the general form of wealth, he becomes co-participant in general wealth up to the limit of his equivalent – a quantitative limit which, of course, turns into a qualitative one, as in every exchange. But he is neither bound to particular objects, nor to a particular manner of satisfaction. The sphere of his consumption is not qualitatively restricted, only quantitatively. This distinguishes him from the slave, serf etc. Consumption certainly reacts on production itself; but this reaction concerns the worker in his exchange as little as it does any other seller of a commodity; rather, as regards mere circulation – and we have as yet no other developed relation before us – it falls outside the economic relation. This much, however, can even now be mentioned in passing, namely that the relative restriction on the sphere of the workers' consumption (which is only quantitative, not qualitative, or rather, only qualitative as posited through the quantitative) gives them as consumers (in the further development of capital the relation between consumption and production must, in general, be more closely examined) an entirely different importance as agents of production from that which they possessed e.g. in antiquity or in the Middle Ages, or now possess in Asia. But, as noted, this does not belong here yet. Similarly, because the worker receives the equivalent in the form of money, the form of general wealth, he is in this exchange an equal *vis-à-vis* the capitalist, like every other party in exchange; at least, so he *seems*. In fact this equality is already disturbed because the worker's relation to the capitalist as a use value, in the form specifically distinct from exchange value, in opposition to value posited as value, is a presupposition of this seemingly simple exchange; because, thus, he already stands in an economically different relation – outside that of exchange, in which the nature of the use value, the particular use value of the commodity is, as such, irrelevant. This semblance exists, nevertheless, as an illusion on his part and to a certain degree on the other side, and thus essentially modifies his relation by comparison to that of workers in other social modes of production. But what is essential is that the purpose of the exchange for him is the satisfaction of his need. The object of his exchange is a direct object of need, not exchange value as such. He does obtain money, it is true, but only in its role as coin; i.e. only as a self-suspending and vanishing mediation. What he obtains from the exchange is therefore not exchange value, not wealth, but a means of subsistence, objects for the preservation of his life, the satisfaction of his needs in general, physical, social etc. It is a specific equivalent in means of subsistence, in objectified labour, measured by the cost of production of his labour. What he gives up is his power to dispose of the latter. On the other side, it is true that even within simple circulation the coin may grow into money, and that in so far as he receives coin in exchange, he can therefore transform it into money by stockpiling it, etc., withdrawing it from circulation; fixes it as general form of wealth, instead of as vanishing medium of exchange. In this respect it could thus be said that, in the exchange between capital and labour, the worker's object – hence, for him, the product of the exchange – is not the means of subsistence, but wealth; not a particular use value, but rather exchange value as such. Accordingly the worker could make exchange value into his own *product* only in the same way in which wealth in general can *appear* solely as *product of simple circulation* in which equivalents are exchanged, namely by sacrificing substantial satisfaction to obtain the *form* of wealth, i.e. through *self-denial*, saving, cutting corners in his consumption so as to withdraw less from circulation than he puts *goods* into it. This is the only possible form of enriching oneself which is posited by circulation itself. Self-denial could then also appear in the more active form, which is not posited in simple circulation, of denying himself more and more rest, and in general denying himself any existence other than his existence as worker, and being as far as possible a worker only; hence more frequently renewing the act of exchange, or extending it quantitatively, hence through *industriousness*. [49] Hence still today the demand for industriousness and also for *saving, self-denial*, is made not upon the capitalists but on the workers, and namely by the capitalists. Society today makes the paradoxical demand that he for whom the object of exchange is subsistence should deny himself, not he for whom it is wealth. The illusion that the capitalists in fact practised 'self-denial' [50] and became capitalists thereby – a demand and a notion which only made any sense at all in the early period when capital was emerging from feudal etc. relations – has been abandoned by all modern economists of sound judgement. The workers are supposed to save, and much bustle is made with savings banks etc. (As regards the latter, even the economists admit that their proper purpose is not wealth, either, but merely a more purposeful distribution of expenditure, so that in their old age, or in case of illness, crises etc., they do not become a burden on the poorhouses, on the state, or on the proceeds of begging (in a word, so that they become a burden on the working class itself and not on the capitalists, vegetating out of the latter’s pockets), i.e. so that they save for the capitalists; and reduce the costs of production for them.) Still, no economist will deny that if the workers *generally*, that is, as *workers* (what the individual worker does or can do, as distinct from his genus, can only exist just as *exception*, not as *rule*, because it is not inherent in the character of the relation itself), that is, if they acted according to this demand as a rule (apart from the damage they would do to general consumption – the loss would be enormous – and hence also to production, thus also to the amount and volume of the exchanges which they could make with capital, hence to themselves as workers) then the worker would be employing means which absolutely contradict their purpose, and which would directly degrade him to the level of the Irish, the level of wage labour where the most animal minimum of needs and subsistence appears to him as the sole object and purpose of his exchange with capital. If he adopted wealth as his purpose, instead of making his purpose use value, he would then, therefore, not only come to no riches, but would moreover lose use value in the bargain. For, as a rule, the maximum of industriousness, of labour, and the minimum of consumption – and this is the maximum of his self-denial and of his moneymaking – could lead to nothing else than that he would receive for his maximum of labour a minimum of wages. By his exertions he would only have diminished the general *level* of the production costs of his own labour and therefore its general price. Only as an exception does the worker succeed through will power, physical strength and endurance, greed etc., in transforming his coin into money, as an exception from his class and from the general conditions of his existence. If all or the majority are too industrious (to the degree that industriousness in modern industry is in fact left to their own personal choice, which is not the case in the most important and most developed branches of production), then they increase not the value of their commodity, but only its quantity; that is, the demands which would be placed on it as use value. If they all save, then a general reduction of wages will bring them back to earth again; for general savings would show the capitalist that their wages are in general too high, that they receive more than its equivalent for their commodity, the capacity of disposing of their own labour; since it is precisely the essence of simple exchange – and they stand in this relation towards him – that no one throws more into circulation than he withdraws; but also that no one can withdraw more than he has thrown in. An individual worker can be *industrious* above the average, more than he has to be in order to live as a worker, only because another lies below the average, is lazier; he can save only because and if another wastes. The most he can achieve on the average with his self-denial is to be able better to endure the fluctuations of prices – high and low, their cycle – that is, he can only distribute his consumption better, but never attain wealth. And that is actually what the capitalists demand. The workers should save enough at the times when business is good to be able more or less to live in the bad times, to endure short time or the lowering of wages. (The wage would then fall even lower.) That is, the demand that they should always hold to a minimum of life's pleasures and make crises easier to bear for the capitalists etc. Maintain themselves as pure labouring machines and as far as possible pay their own wear and tear. Quite apart from the sheer brutalization to which this would lead – and such a brutalization itself would make it impossible even to strive for wealth in general form, as money, stockpiled money – (and the worker's participation in the higher, even cultural satisfactions, the agitation for his own interests, newspaper subscriptions, attending lectures, educating his children, developing his taste etc., his only share of civilization which distinguishes him from the slave, is economically only possible by widening the sphere of his pleasures at the times when business is good, where saving is to a certain degree possible), [apart from this,] he would, if he saved his money in a properly ascetic manner and thus heaped up premiums for the lumpenproletariat, pickpockets etc., who would increase in proportion with the demand, he could conserve savings – if they surpass the piggy-bank amounts of the official savings banks, which pay him a minimum of interest, so that the capitalists can strike high interest rates out of his savings, or the state eats them up, thereby merely increasing the power of his enemies and his own dependence – conserve his savings and make them fruitful only by putting them into banks etc., so that, afterwards, in times of crisis he loses his deposits, after having in times of prosperity foregone all life's pleasures in order to increase the power of capital; thus has saved in every way *for* capital, not for himself.

Incidentally – in so far as the whole thing is not a hypocritical phrase of bourgeois ‘philanthropy’, which consists in fobbing the worker off with ‘pious wishes’ – each capitalist does demand that his workers should save, but only *his own*, because they stand towards him as workers; but by no means the remaining *world of workers*, for these stand towards him as consumers. In spite of all ‘pious’ speeches he therefore searches for means to spur them on to consumption, to give his wares new charms, to inspire them with new needs by constant chatter etc. It is precisely this side of the relation of capital and labour which is an essential civilizing moment, and on which the historic justification, but also the contemporary power of capital rests. (This relation between production and consumption to be developed only under capital and profit etc.) (Or, then again, under accumulation and competition of capitals.) These are nevertheless all exoteric observations, relevant here only in so far as they show the demands of hypocritical bourgeois philanthropy to be self-contradictory and thus to prove precisely what they were supposed to refute, namely that in the exchange between the worker and capital, the worker finds himself in the relation of simple circulation, hence obtains not wealth but only subsistence, use values for immediate consumption. That this demand contradicts the relation itself emerges from the simple reflection (the recently and complacently advanced demand that the workers should be given a certain share in profits [51] is to be dealt with in the section *wage labour*; other than as a *special bonus* which can achieve its purpose only as an exception from the rule, and which is in fact, in noteworthy practice, restricted to the buying-up of individual overlookers etc. in the interests of the employer *against* the interests of their class; or to travelling salesmen etc., in short, no longer *simple workers*, hence also not to the simple relation; or else it is a special way of cheating the workers and of *deducting a part of their wages* in the more precarious form of a profit depending on the state of the business) that, if the worker’s savings are not to remain merely the product of circulation – saved up money, which can be realized only by being converted sooner or later into the substantial content of wealth, pleasures etc. – then the saved-up money would itself have to become capital, i.e. buy labour, relate to labour as use value. It thus presupposes labour which is not capital, and presupposes that labour has become its opposite – not-labour. In order to become capital, it itself presupposes labour as not-capital as against capital; hence it presupposes the establishment at another point of the contradiction it is supposed to overcome. if, then, in the original relation itself, the object and the *product* of the worker's exchange – as product of mere exchange, it can be no other – were not use value, subsistence, satisfaction of direct needs, withdrawal from circulation of the equivalent put into it in order to be destroyed by consumption – then labour would confront capital not as labour, not as not-capital, but as capital. But capital, too, cannot confront capital if capital does not confront labour, since capital is only capital as not-labour; in this contradictory relation. Thus the concept and the relation of capital itself would be destroyed. That there are situations in which property-owners who themselves work engage in exchange with one another is certainly not denied. But such conditions are not those of the society in which capital as such exists in developed form; they are destroyed at all points, therefore, by its development. As capital it can posit itself only by positing labour as not-capital, as pure use value. (As a slave, the worker has *exchange value*, a *value*; as a free wage-worker he has *no value*; it is rather his power of disposing of his labour, effected by exchange with him, which has value. It is not he who stands toward the capitalist as exchange value, but the capitalist toward him. His *valuelessness* and *devaluation* is the presupposition of capital and the precondition of *free* labour in general. Linguet regards it as a step backwards; [52] he forgets that the worker is thereby formally posited as a person who is something for himself *apart from his* labour, and who alienates his life-expression only as a means towards his own life. So long as the worker as such has *exchange value, industrial capital* as such cannot exist, hence nor can developed capital in general. Towards the latter, labour must exist as *pure use value*, which is offered as a commodity by its possessor himself in exchange for it, for its *exchange value,* which of course becomes real in the worker's hand only in its role as general medium of exchange; otherwise vanishes.) Well. The worker, then, finds himself only in the relation of simple circulation, of simple exchange, and obtains only *coin* for his use value; subsistence; but mediated. This form of mediation is, as we saw, essential to and characteristic of the relation. That it can proceed to the transformation of the coin into money – savings – proves precisely only that his relation is that of simple circulation; he can save more or less; but beyond that he cannot get; he can realize what he has saved only by momentarily expanding the sphere of his pleasures. It is of importance – and penetrates into the character of the relation itself – that, because money is the product of his exchange, general wealth drives him forward as an illusion; makes him industrious. At the same time, this not only formally opens up a field of arbitrariness in the realiz ... [53]

NOTEBOOK III

29 November – c. mid-December 1857

The Chapter on Capital (continuation)

(*Labour power as* capital!) – *Wages not productive*

[1] ... processes of the same subject; thus e.g. the substance of the eye, the capital of vision etc. Such belletristic phrases, which relate everything to everything else by means of some analogy, may even appear profound the first time they are expressed, all the more so if they identify the most disparate things. Repeated, however, and then repeated with outright complacency as statements of scientific value, they are purely and simply ridiculous. Good only for belletristic sophomores and empty chatterboxes who defile all the sciences with their liquorice-sweet filth. The fact that labour is a constant new source of exchange for the worker as long as he is capable of working – meaning not exchange in general, but exchange with capital – is inherent in the nature of the concept itself, namely that he only sells a temporary disposition over his labouring capacity, [2] hence can always begin the exchange anew as soon as he has taken in the quantity of substances required in order to reproduce the externalization of his life [*Lebensäusserung*]. Instead of aiming their amazement in this direction – and considering the worker to owe a debt to capital for the fact that he is alive at all, and can repeat certain life processes every day as soon as he has eaten and slept enough – these whitewashing sycophants of bourgeois economics should rather have fixed their attention on the fact that, after constantly repeated labour, he always has *only* his living, direct labour itself to exchange. The repetition itself is in fact only apparent. *What he exchanges for capital is his entire labouring capacity, which he spends, say, in 20 years*. Instead of paying him for it in a lump sum, capital pays him in small doses, as he places it at capital's disposal, say weekly. This alters absolutely nothing in the nature of the thing and gives no grounds whatsoever for concluding that – because the worker has to sleep 10–12 hours before he becomes capable of repeating his labour and his exchange with capital – labour forms *his capital*. [3] What this argument in fact conceives as capital is the limit, the interruption of his labour, since he is not a perpetuum mobile. The struggle for the ten hours' bill etc. proves that the capitalist likes

nothing better than for him *to squander his dosages of vital force as much as possible, without interruption.* We now come to the second process, which forms the relation between capital and labour *after* this exchange. We want to add here only that the economists themselves express the above statement by saying that *wages* are *not productive.* For them, of course, to be productive means to be productive of wealth. Now, since wages are the product of the exchange between worker and capital – and the only product posited in this act itself – they therefore admit that the worker produces *no wealth* in this exchange, neither for the capitalist, because for the latter the payment of money for a use value – and this *payment* forms the only function of capital in this relation – is a sacrifice of wealth, not creation of the same, which is why he tries to pay the smallest amount possible; nor for the worker, because it brings him only subsistence, the satisfaction of individual needs, more or less – *never* the general form of wealth, never wealth. Nor can it do so, since the content of the commodity which he sells rises in no way above the general laws of circulation: [his aim is] to obtain for the value which he throws into circulation its equivalent, through the coin, in another use value, which he consumes. Such an operation, of course, can never bring wealth, but has to bring back him who undertakes it exactly to the point at which he began. This does not exclude, as we saw, but rather includes, the fact that the sphere of his immediate gratifications is capable of a certain contraction or expansion. On the other side, if the capitalist – who is not yet posited as capitalist at all in this exchange, but only as *money* – were to repeat this act again and again, his money would soon be eaten up by the worker, who would have wasted it in a series of other gratifications, mended trousers, polished boots – in short, services received. In any case, the repetition of this operation would be precisely limited by the circumference of his moneybag. They would no more enrich him than does the expenditure of money for other use values for his beloved person, which, as is well known, do not – pay him, but cost him.

The exchange between capital and labour belongs within simple circulation, does not enrich the worker. – Separation of labour and property the precondition of this exchange. – Labour as object absolute poverty, labour as subject general possibility of

wealth. – Labour without particular specificity confronts capital

It may seem peculiar, in this relation between labour and capital, and already in this first relation of exchange between the two, that the worker here buys the exchange value and the capitalist the use value, in that labour confronts capital not as *a* use value, but as *the* use value pure and simple, but that the capitalist should obtain wealth, and the worker merely a use value which ends with consumption. <In so far as this concerns the capitalist, to be developed only with the second process.> This appears as a dialectic which produces precisely the opposite of what was to be expected. However, regarded more precisely, it becomes clear that the worker who exchanges his commodity goes through the form C–M–M–C in the exchange process. If the point of departure in circulation is the commodity, use value, as the principle of exchange, then we necessarily arrive back at the commodity, since money appears only as coin and, as medium of exchange, is only a vanishing mediation; while the commodity as such, after having described its circle, is consumed as the direct object of need. On the other hand, capital represents M–C–C–M, the antithetical moment.

Separation of property from labour appears as the necessary law of this exchange between capital and labour. Labour posited as *not-capital* as such is: (1) *not-objectified labour [nicht-vergegenständlichte Arbeit], conceived negatively* (itself still objective; the not-objective itself in objective form). As such it is not-raw-material, not-instrument of labour, not-raw-product: labour separated from all means and objects of labour, from its entire objectivity. This living labour, existing as an *abstraction* from these moments of its actual reality (also, not-value); this complete denudation, purely subjective existence of labour, stripped of all objectivity. Labour as *absolute poverty*: poverty not as shortage, but as total exclusion of objective wealth. Or also as the existing *not-value*, and hence purely objective use value, existing without mediation, this objectivity can only be an objectivity not separated from the person: only an objectivity coinciding with his immediate bodily existence. Since the objectivity is purely immediate, it is just as much direct not-objectivity. In other words, not an objectivity which falls outside the immediate presence [*Dasein*] of the individual himself. (2) *Not-objectified labour, not-value*, conceived *positively*, or as a negativity in relation to itself, is the not-*objectified*, hence non-objective, i.e. subjective existence of labour itself. Labour not as an object, but as activity; not as itself *value*, but as the *living source* of value. [Namely, it is] general wealth (in contrast to capital in which it exists objectively, as reality) as the *general possibility* of the same, which proves itself as such in action. Thus, it is not at all contradictory, or, rather, the in-every-way mutually contradictory statements that labour is *absolute poverty as object*, on one side, and is, on the other side, the *general possibility* of wealth as subject and as activity, are reciprocally determined and follow from the essence of labour, such as it is *presupposed* by capital as its contradiction and as its contradictory being, and such as it, in turn, presupposes capital.

The last point to which attention is still to be drawn in the relation of labour to capital is this, that as the use value which confronts money posited as capital, labour is not this or another labour, but *labour pure and simple*, abstract labour; absolutely indifferent to its particular *specificity* [*Bestimmtheit*], but capable of all specificities. Of course, the particularity of labour must correspond to the particular substance of which a given capital consists; but since capital *as such* is indifferent to every particularity of its substance, and exists not only as the totality of the same but also as the abstraction from all its particularities, the labour which confronts it likewise subjectively has the same totality and abstraction in itself. For example, in guild and craft labour, where capital itself still has a limited form, and is still entirely immersed in a particular substance, hence is not yet *capital as such*, labour, too, appears as still immersed in its particular specificity: not in the totality and abstraction of labour *as such*, in which it confronts capital. That is to say that labour is of course in each single case a specific labour, but capital can come into relation with every *specific* labour; it confronts the *totality* of all labours δυνάμει, [4] and the particular one it confronts at a given time is an accidental matter. On the other side, the worker himself is absolutely indifferent to the specificity of his labour; it has no interest for him as such, but only in as much as it is in fact *labour* and, as such, a use value for capital. It is therefore his economic character that he is the carrier of labour as such – i.e. of labour as *use value* for capital; he is a worker, in opposition to the capitalist. This is not the character of the craftsmen and guild-members etc., whose economic character lies precisely in the *specificity* of their labour and in their relation to a *specific* *master*, etc. This economic relation – the character which capitalist and worker have as the extremes of a single relation of production – therefore develops more purely and adequately in proportion as labour loses all the characteristics of art; as its particular skill becomes something more and more abstract and irrelevant, and as it becomes more and more a *purely abstract activity*, a purely mechanical activity, hence indifferent to its particular form; a merely *formal* activity, or, what is the same, a merely *material* [*stofflich*] activity, activity pure and simple, regardless of its form. Here it can be seen once again that the particular specificity of the relation of production, of the category – here, capital and labour – becomes real only with the development of a particular *material mode of production* and of a particular stage in the development of the industrial *productive forces*. (This point in general to be particularly developed in connection with this relation, later; since it is here already *posited* in the relation itself, while, in the case of the abstract concepts, exchange value, circulation, money, it still lies more in our subjective reflection.)

Labour process absorbed into capital. (Capital and capitalist)

(2) We now come to the second side of the process. The exchange between capital or capitalist and the worker is now finished, in so far as we are dealing with the process of *exchange* as such. We now proceed to the relation of capital to labour as capital's use value. Labour is not only the *use value* which confronts capital, but, rather, it is *the use value* of capital itself. As the not-being of values in so far as they are objectified, labour is their being in so far as they are not-objectified; it is their ideal being; the possibility of values, and, as activity, the positing of value. As against capital, labour is the merely abstract form, the mere possibility of value-positing activity, which exists only as a capacity, as a resource in the bodiliness of the worker. But when it is made into a real activity through contact with capital – it cannot do this by itself, since it is without object – then it becomes a really value-positing, productive activity. In relation with capital, this activity can in general consist only of the reproduction of itself – of the preservation and increase of itself as the *real* and *effective* value, not of the merely intended value, as with money as such. Through the

exchange with the worker, capital has appropriated labour itself; labour has become one of its moments, which now acts as a fructifying vitality upon its merely existent and hence dead objectivity. Capital is money (exchange value posited for itself), but no longer is it money as existing in a particular substance and hence excluded from other substances of exchange value and existing alongside them, but rather money as obtaining its ideal character from all substances, from the exchange values of every form and mode of objectified labour. Now, in so far as capital, money existing in all particular forms of objectified labour, enters into the process with not-objectified, but rather living labour, labour existing as process and as action, it is initially this qualitative difference of the substance in which it exists from the form in which it now *also* exists as labour. It is the process of this differentiation and of its suspension, in which capital itself becomes a process. Labour is the yeast thrown into it, which starts it fermenting. On the one side, the objectivity in which it exists has to be worked on, i.e. consumed by labour; on the other side, the mere subjectivity of labour as a mere form has to be suspended, and labour has to be objectified in the material of capital. The relation of capital, in its content, to labour, of objectified labour to living labour – in this relation, where capital appears as passive towards labour, it is its passive being, as a particular substance, which enters into relation with the forming activity of labour – can, in general, be nothing more than the relation of labour to its objectivity, its material – which is to be analysed already in the first chapter, which has to precede exchange value and treat of production in general – and in connection with labour as activity, the material, the objectified labour, has only two relations, that of the *raw material*, i.e. of the formless matter, the mere material for the form-positing, purposive activity of labour, and that of the *instrument of labour*, the objective means which subjective activity inserts between itself as an object, as its conductor. The concept of the *product*, which the economists introduce here, does not yet belong here at all as an aspect *distinct* from raw material and instrument of labour. It appears as *result*, not as *presupposition* of the process between the passive content of capital and labour as activity. As a *presupposition*, the product is not a distinct relation of the object to labour; distinct from raw material and instrument of labour, since raw material and instrument of labour, as substance of values, are themselves already *objectified* labour, *products*. The substance of value is not at all the particular natural substance, but rather objectified labour. This latter itself appears again in connection with *living labour* as *raw material* and *instrument of labour*. As regards the pure act of production in itself, it may seem that the instrument of labour and the raw material are found freely in nature, so that they need merely to be *appropriated*, i.e. made into the object and means of labour, which is not itself a labour process. Thus, in contrast to them, the *product* appears as something qualitatively different, and is a product not only as a result of labour with an instrument on a material, but rather as the first *objectification of labour* alongside them. But, as components of capital, raw material and instrument of labour are themselves already objectified labour, hence *product*. This does not yet exhaust the relation. For, e.g. in the kind of production in which no exchange value, no capital at all exists, the product of labour can become the means and the object of new labour. For example, in agricultural production purely for use value. The hunter's bow, the fisherman's net, in short the simplest conditions, already presuppose a product which ceases to count as product and becomes *raw material* or more specifically *instrument of production*, for this [is] actually the first specific form in which the product appears as the means of reproduction. This link therefore by no means exhausts the relation in which *raw material* and *instrument of labour* appear as moments of capital itself. The economists, incidentally, introduce the *product* as third element of the substance of capital in another connection entirely, as well. This is the product in so far as its character is to step outside both the process of production and circulation, and to become immediate object of individual consumption; *approvisionnement*, as Cherbuliez calls it. [5] That is, the products presupposed so that the worker lives as a worker and is capable of living during production, before a new product is created. That the capitalist possesses this capacity is posited in the fact that every element of capital is money, and, as such, can be transformed from its general form of wealth into the material of wealth, object of consumption. The economists' *approvisionnement* thus applies only to the workers; i.e. it is money expressed in the form of articles of consumption, use values, which they obtain from the capitalist in the act of exchange between the two of them. But this belongs within the first act. The extent to which this first relates to the second is not yet the question here. The only diremption posited by the process of production itself is the original diremption, that posited by the difference between objective labour and living labour itself, i.e. that between *raw material* and *instrument of labour*. It is quite consistent of the economists to confuse these two aspects with each other, because they must bring the two moments in the relation between capital and labour into confusion and cannot allow themselves to grasp their specific difference.

Thus: the raw material is consumed by being changed, formed by labour, and the instrument of labour is consumed by being used up in this process, worn out. On the other hand, labour also is consumed by being employed, set into motion, and a certain amount of the worker's muscular force etc. is thus expended, so that he exhausts himself. But labour is not only consumed, but also at the same time fixed, converted from the form of activity into the form of the object; materialized; as a modification of the object, it modifies its own form and changes from activity to being. The end of the process is the *product*, in which the raw material appears as bound up with labour, and in which the instrument of labour has, likewise, transposed itself from a mere possibility into a reality, by having become a real conductor of labour, but thereby also having been consumed in its static form through its mechanical or chemical relation to the material of labour. All three moments of the process, the material, the instrument, and labour, coincide in the neutral result – the *product*. The moments of the process of production which have been consumed to form the product are simultaneously reproduced in it. The whole process therefore appears as *productive consumption*, i.e. as consumption which terminates neither in a *void*, nor in the mere subjectification of the objective, but which is, rather, again posited as an *object*. This consumption is not simply a consumption of the material, but rather consumption of consumption itself; in the suspension of the material it is the suspension of this suspension and hence the *positing* of the same. [6] This *form-giving* activity consumes the object and consumes itself, but it consumes the given form of the object only in order to posit it in a new objective form, and it consumes itself only in its subjective form as activity. It consumes the objective character of the object – the indifference towards the form – and the subjective character of activity; forms the one, materializes the other. But as *product*, the result of the production process is *use value.*

If we now regard the result so far obtained, we find:

Firstly: The appropriation, absorption of labour by capital – money, i.e. the act of buying the capacity of disposing over the worker, here appears only as a means to bring this process about, not as one of its moments – brings capital into ferment, and makes it into a process, *process of production*, in whose totality it relates to itself not only as objectified by living labour, but also, because objectified, [as] mere *object* of labour.

Secondly: Within simple circulation, the substance of the commodity and of money was itself indifferent to the formal character, i.e. to the extent that commodity and money remained moments of circulation. As for the substance of the commodity, it fell outside the economic relation as an object of consumption (of need); money, in so far as its form achieved independence, was still related to circulation, but only negatively, and was only this negative relation. Fixed for itself, it similarly became extinguished in dead materiality, and ceased to be money. Both commodity and money were expressions of exchange value, and differed only as general and particular exchange value. This difference itself was again merely a nominal one, since not only were the two roles switched in real circulation, but also, if we consider each of them by itself, money itself was a particular commodity, and the commodity as price was itself general money. The difference was only formal. Each of them was posited in the one role only in so far as and because it was not posited in the other. Now however, in the process of production, capital distinguishes itself as form from itself as substance. It is both aspects at once, and at the same time the relation of both to one another. But:

Thirdly: It still only appeared as this relation *in itself*. The relation is not *posited* yet, or it is posited initially only in the character of one of its two moments, the *material* moment, which divides internally into material (raw material and instrument) and form (labour), and which, as a relation between both of them, as a real process, is itself only a material relation again – a relation of the two material elements which form the content of capital as distinct from its formal relation as capital. If we now consider the aspect of capital in which it originally appears in distinction from labour, then it is merely a passive presence in the process, a merely objective being, in which the formal character which makes it capital – i.e. a social relation existing as being-for-itself [*für sich seiendes*] – is completely extinguished. It enters the process only as content – as objectified labour in general; but the fact that it is objectified labour is completely irrelevant to labour – and the relation of labour to it forms the process; it enters into the process, is worked on, rather, only as object, not as *objectified labour*. Cotton which becomes cotton yarn, or cotton yarn which becomes cloth, or cloth which becomes the material for printing and dyeing, exist for labour only as available cotton, yarn, cloth. They themselves do not enter into any process as products of labour, as objectified labour, but only as material existences with certain natural properties. *How* these were posited in them makes no difference to the relation of living labour towards them; they exist for it only in so far as they exist as distinct from it, i.e. as material for labour. This [is the case], in so far as the point of departure is capital in its objective form, presupposed to labour. On another side, in so far as labour itself has become one of capital's objective elements through the exchange with the worker, labour's distinction from the objective elements of capital is itself a merely objective one; the latter in the form of rest, the former in the form of activity. The relation is the material relation between one of capital's elements and the other; but not *its own* relation to both. It therefore appears on one side as a merely *passive object*, in which all formal character is extinguished; it appears on the other side only as a simple *production process* into which capital as such, as distinct from its substance, does not enter. It does not even appear in the substance appropriate to itself – as objectified labour, for this is the substance of exchange value – but rather only in the natural form-of-being [*Daseinsform*] of this substance, in which all relation to exchange value, to objectified labour, and to labour itself as the use value of capital – and hence all relation to capital itself – is extinguished. Regarded from this side, the process of capital coincides with the simple process of production as such, in which its character as capital is quite as extinguished in the form of the process, as money was extinguished as money in the form of value. To the extent to which we have examined the process so far, capital in its being-for-itself, i.e. the capitalist, does not enter at all. It is not the capitalist who is consumed by labour as raw material and instrument of labour. And it is not the capitalist who does this consuming but rather labour. Thus the process of the production of capital does not appear as the process of the production of capital, but as the process of production in general, and capital's *distinction from labour* appears only in the material character of *raw material* and *instrument of labour*. It is this aspect – which is not only an arbitrary abstraction, but rather an abstraction which takes place within the process itself – on which the economists seize in order to represent capital as a necessary element of every production process. Of course, they do this only by forgetting to pay attention to its conduct as capital during this process.

This is the occasion to draw attention to a moment which here, for the first time, not only arises from the standpoint of the observer, but is posited in the economic relation itself. In the first act, in the exchange between capital and labour, labour as such, existing *for itself*, necessarily appeared as *the worker*. Similarly here in the second process: capital as such is posited as a value existing for itself, as egotistic value, so to speak (something to which money could only aspire). But capital in its being-for-itself is the *capitalist*. Of course, socialists sometimes say, we need capital, but not the capitalist. [7] Then capital appears as a pure thing, not as a relation of production which, reflected in itself, is precisely the capitalist. I may well separate capital from a given individual capitalist, and it can be transferred to another. But, in losing capital, he loses the quality of being a capitalist. Thus capital is indeed separable from an individual capitalist, but not from *the* capitalist, who, as such, confronts *the* worker. Thus also the individual worker can cease to be the being-for-itself [*Fürsichsein*] of labour; he may inherit or steal money etc. But then he ceases to be a *worker*. As a worker he is nothing more than labour in its being-for-itself. (This to be further developed later.) [8]

Production process *as content of capital. Productive and unproductive labour (productive labour – that which produces capital). – The worker relates to his labour as exchange value, the capitalist as use value etc. – He divests himself* [entäussert sich] *of labour as the wealth-producing power. (Capital appropriates it as such.) Transformation of labour into capital etc. Sismondi, Cherbuliez, Say, Ricardo, Proudhon etc.*

Nothing can emerge at the end of the process which did not appear as a presupposition and precondition at the beginning. But, on the other hand, everything also has to come out. Thus, if at the end of the process of production, which was begun with the presuppositions of capital, capital appears to have vanished as a formal relation, then this can have taken place only because the invisible threads which draw it through the process have been overlooked. Let us therefore consider this side.

The first result, then, is this:

(α) Capital becomes the process of production through the incorporation of labour into capital; initially, however, it becomes the *material* process of production; the process of production in general, so that the process of the production of capital is not distinct from the material process of production as such. Its formal character is completely extinguished. Because capital has exchanged a part of its objective being for labour, its objective being is itself internally divided into object and labour; the connection between them forms the production process, or, more precisely, the *labour process*. With that, the *labour process posited prior to value, as point of departure* – which, owing to its abstractness, its pure materiality, is common to all forms of production – here reappears *again within capital*, as a process which proceeds within its substance and forms its content.

(It will be seen that even within the production process itself this *extinguishing of the formal character* is merely a semblance.) [9]

In so far as capital is value, but appears as a process initially in the form of the simple production process, the production process posited in no particular *economic* form, but rather, the production process pure and simple, to that extent – depending on which particular aspect of the simple production process (which, as such, as we saw, by no means presupposes capital, but is common to all modes of production) is fixed on – it can be said that capital becomes product, or that it is instrument of labour or raw material for labour. Further, if it is conceived in one of the aspects which confronts labour as material or as mere means, then it is correct to say that capital is not productive, * because it is then regarded merely as the object, the material which confronts labour; as merely passive. The correct thing, however, is that it appears not as one of these aspects, nor as a difference within one of these aspects, nor as mere result (product), but rather as the simple production process itself; that this latter now appears as the self-propelling *content* of capital.

> * What is *productive labour* and what is *not*, a point very much disputed back and forth since Adam Smith made this distinction, [10] has to emerge from the dissection of the various aspects of capital itself. *Productive labour* is only that which produces *capital*. Is it not crazy, asks e.g. (or at least something similar) Mr Senior, that the piano maker is a *productive worker*, but not the *piano player*, although obviously the piano would be absurd without the piano player? [11] But this is exactly the case. The piano maker reproduces *capital*; the pianist only exchanges his labour for revenue. But doesn't the pianist produce music and satisfy our musical ear, does he not even to a certain extent produce the latter? He does indeed: his labour produces something; but that does not make it *productive labour* in the *economic sense*; no more than the labour of the madman who produces delusions is productive. *Labour becomes productive only by producing its own opposite.* Other economists therefore allow the so-called unproductive worker to be productive indirectly. For example, the pianist stimulates production; partly by giving a more decisive, lively tone to our individuality, and also in the ordinary sense of awakening a new need for the satisfaction of which additional energy becomes expended in direct material production. This already admits that only such labour is productive as produces capital; hence that labour which does not do this, regardless of how *useful* it may be – it may just as well be harmful – is not productive for capitalization, is hence unproductive labour. Other economists say that the difference between productive and unproductive applies not to production but to consumption. Quite the contrary. The producer of tobacco is productive, although the consumption of tobacco is unproductive. Production for unproductive consumption is quite as productive as that for productive consumption; always assuming that it produces or reproduces capital. '*Productive labourer he that directly augments his master's wealth,*' Malthus therefore says, quite correctly (IX,40); [12] correct at least in one aspect. The expression is too abstract, since in this formulation it holds also for the slave. The master's wealth, in relation to the worker, is the form of wealth itself in its relation to labour, namely capital. Productive labourer he that directly augments capital.

(β) Now to look at the side of the form-character, such as it preserves and modifies itself in the production process.

As *use value*, labour exists only *for capital*, and is itself the use value of capital, i.e. the mediating activity by means of which it *realizes* [*verwertet*] itself. Capital, as that which reproduces and increases its value, is autonomous exchange value (money), as a process, as the *process of realization.*

Therefore, labour does not exist as a use value for the worker; *for* him it is therefore not a *power productive of wealth,* [and] not a means or the activity of gaining wealth. He brings it as a use value into the exchange with capital, which then confronts him not as capital but rather as *money*. In relation to the worker, it is capital as capital only in the consumption of labour, which initially falls outside this exchange and is independent of it. A *use value* for capital, labour is a *mere exchange value* for the worker; available *exchange value*. It is posited as such in the act of exchange with capital, through its sale for money. The use value of a thing does not concern its seller as such, but only its buyer. The property of saltpetre, that it can be used to make gunpowder, does not determine the price of saltpetre; rather, this price is determined by the cost of production of saltpetre, by the amount of labour objectified in it. The value of use values which enter circulation as prices is not the product of circulation, although it realizes itself only in circulation; rather, it is *presupposed* to it, and is realized only through exchange for money. Similarly, the labour which the worker sells as a *use value* to capital is, for the worker, his *exchange value*, which he wants to realize, but which is already *determined* prior to this act of exchange and presupposed to it as a condition, and is determined like the value of every other commodity by supply and demand; or, in general, which is our only concern here, by the cost of production, the amount of objectified labour, by means of which the labouring capacity of the worker has been produced and which he therefore obtains for it, as its equivalent. The exchange value of labour, the realization of which takes place in the process of exchange with the capitalist, is therefore *presupposed*, predetermined, and only undergoes the formal modification which every only ideally posited price takes on when it is realized. It is not determined by the use value of labour. It has a use value for the worker himself only in so far as it is *exchange value*, not in so far as it produces exchange values. It has exchange value for capital only in so far as it is use value. It is a use value, as distinct from exchange value, not for the worker himself, but only for capital. The worker therefore sells labour as a simple, predetermined exchange value, determined by a previous process – he sells labour itself as *objectified labour*; i.e. he sells labour only in so far as it already objectifies a definite amount of labour, hence in so far as its equivalent is already measured, given; capital buys it as living labour, as the general productive force of wealth; activity which increases wealth. It is clear, therefore, that the worker cannot become *rich* in this exchange, since, in exchange for his labour capacity as a fixed, available magnitude, he surrenders its *creative power*, like Esau his birthright for a mess of pottage. Rather, he necessarily impoverishes himself, as we shall see further on, because the creative power of his labour establishes itself as the power of capital, as an *alien power* confronting him. He *divests* himself [*entäussert sich*] of labour as the force productive of wealth; capital appropriates it, as such. The separation between labour and property in the product of labour, between labour and wealth, is thus posited in this act of exchange itself. What appears paradoxical as *result* is already contained in the presupposition. The economists have expressed this more or less empirically. Thus the productivity of his labour, his labour in general, in so far as it is not a *capacity* but a motion, *real* labour, *comes* to confront the worker as an *alien power*; capital, inversely, realizes itself through the *appropriation of alien labour*. (At least the possibility of realization is thereby posited; as result of the exchange between labour and capital. The relation is realized only in the act of production itself, where capital really consumes the alien labour.) Just as labour, as a *presupposed* exchange value, is exchanged for an equivalent in money, so the latter is again exchanged for an equivalent in *commodities*, which are consumed. In this process of exchange, labour is not productive; it becomes so only for capital; it can take out of circulation only what it has thrown into it, a *predetermined* amount of commodities, which is as little its own product as it is its own value. Sismondi says that the workers exchange their labour for grain, which they consume, while their labour 'has become *capital* for its master'. (Sismondi, VI.) [13] 'Giving their labour in exchange, the workers *transform* it into capital.' (id., VIII.) [14] By selling his labour to the capitalist, the worker obtains a right only to the *price of labour*, not to the *product of his labour*, nor to the value which *his labour has added to it.* (Cherbuliez XXVIII.) '*Sale of labour = renunciation of all fruits of labour.*' (loc.cit.) [15] Thus all the progress of civilization, or in other words every increase in the *powers of social production* [*gesellschaftliche Produktivkräfte*], if you like, in the *productive powers of labour itself* – such as results from science, inventions, division and combination of labour, improved means of communication, creation of the world market, machinery etc. – enriches not the worker but rather *capital*; hence it only magnifies again the power dominating over labour; increases only the productive power of capital. Since capital is the antithesis of the worker, this merely increases the *objective power* standing over labour. The *transformation of labour* (as living, purposive activity) into *capital* is, *in itself*, the result of the exchange between capital and labour, in so far as it gives the capitalist the title of ownership to the product of labour (and command over the same). *This transformation is posited* only in the *production process* itself. Thus, the question whether capital is productive or not is absurd. Labour itself is *productive only* if absorbed into capital, where capital forms the basis of production, and where the capitalist is therefore in command of production. The productivity of labour becomes the productive force of capital just as the general exchange value of commodities fixes itself in money. Labour, such as it exists *for itself* in the worker in opposition to capital, that is, labour in its *immediate being*, separated from capital, is *not productive*. Nor does it ever become *productive* as an activity of the worker so long as it merely enters the simple, only formally transforming process of circulation. Therefore, those who demonstrate that the productive force ascribed to capital is a *displacement*, a *transposition of the productive force* of labour, [16] forget precisely that capital itself is essentially this *displacement, this transposition*, and that wage labour as such presupposes capital, so that, from its standpoint as well, capital is this *transubstantiation*; the necessary process of positing its own powers as *alien* to the worker. Therefore, the demand that wage labour be continued but capital suspended is self-contradictory, self-dissolving. Others say, even economists, e.g. Ricardo, Sismondi etc., that *only labour* is productive, not capital. [17] But then they do not conceive [18] capital in its *specific character as form*, as a *relation of production* reflected into itself, but think only about its material substance, raw material etc. But these material elements do not make capital into capital. Then, however, they recall that capital is also in another respect a *value*, that is, something *immaterial*, something indifferent to its material consistency. Thus, Say: '*Capital is always an immaterial essence*, because it is not material which makes capital, but the *value* of this material, a value which has nothing corporeal about it.' (Say, 21.) [19] Or: Sismondi: 'Capital is a commercial *idea*.' (Sismondi, LX.) [20] But then they recall that capital is a different economic quality as well, other than *value*, since otherwise it would not be possible to speak of capital *as distinct from value* at all, and, if all capitals were value, all values as such would still not be capital. Then they take refuge again in its material form within the production process, e.g. when Ricardo explains that capital is 'accumulated labour employed in the production of new labour', [21] i.e. merely as *instrument of labour* or *material for labour*. In this sense Say even speaks of the '*productive service of capital*', [22] on which remuneration is supposed to be based, as if the instrument of labour as such were entitled to thanks from the worker, and as if it were not precisely because of him that it is posited as instrument of labour, as *productive*. This presupposes the autonomy of the instrument of labour, i.e. of its *social* character, i.e. its character as capital, in order to derive the privileges of capital from it. Proudhon's phrase '*le capital vaut, le travail produit*' [23] means absolutely nothing more than: capital is value, and, since nothing further is here said about capital other than that it is value, that value is value (the subject of the judgement is here only another name for the predicate); [24] and labour produces, is productive labour, i.e. labour is labour, since it is precisely nothing apart from '*produire*'. [25] It must be obvious that these identical judgements do not contain any particularly deep wisdom, and that above all, they cannot express a relation in which value and labour enter into connection, in which they connect and divide in relation to one another, and where they do not lie side by side in mutual indifference. Already the fact that it is *labour* which confronts capital as subject, i.e. the worker only in his character as *labour*, and not *he himself*, should open the eyes. This alone, disregarding capital, already contains a relation, a relation of the worker to his own activity, which is by no means the *'natural'* one, but which itself already contains a specific *economic* character.

To the extent that we are considering it here, as a relation distinct from that of value and money, capital is *capital in general*, i.e. the incarnation of the qualities which distinguish value as capital from value as pure value or as money. Value, money, circulation etc., prices etc. are presupposed, as is labour etc. But we are still concerned neither with a *particular* form of capital, nor with an *individual* capital as distinct from other individual capitals etc. We are present at the process of its becoming. This dialectical process of its becoming is only the ideal expression of the real movement through which capital comes into being. The later relations are to be regarded as developments coming out of this germ. But it is necessary to establish the specific form in which it is posited at a *certain* point. Otherwise confusion arises.

Realization process [*Verwertungsprozess*]. – *(Costs of production.)* – *(Surplus value not explicable by exchange.* Ramsay. Ricardo.) *Capitalist cannot live from his wage etc.* (Faux frais de production.) [26] – *Mere self-preservation, non-multiplication of value contradicts the essence of capital*

Hitherto, capital has been regarded from its material side as a *simple production process*. But, from the side of its formal specificity this process is a *process of self-realization*. Self-realization includes preservation of the prior value, as well as its multiplication.

Value enters as subject. Labour is purposeful activity, and the material side therefore presupposes that the instrument of labour has really been used as means to an end in the production process, and that the raw material has obtained a higher use value as product than it had before, whether this is due to chemical alteration or mechanical modification. However, this side alone, as impinging merely on the use value, still belongs in the simple production process. It is not the point here – this is, rather, understood, presupposed – that a higher use value has been created (this in itself is very relative; when grain is transformed into spirits, the higher use value is itself already posited in respect of circulation); no higher use value has yet been created for the individual, the producer. This, in any case, is accidental, and does not affect the relation as such; rather, a higher use value *for others*. The point is, [rather,] that a *higher exchange value* be created. In the case of simple circulation, the process ended for the individual commodity by its being consumed as use value. With that, it left circulation; lost its exchange value, its economic form-character [*Formbestimmung*] in general. Capital has consumed its material with labour and its labour with material; it has consumed itself as use value, but only as *use value for itself*, as capital. Its consumption as use value therefore in this case falls within circulation itself, or rather it itself posits the *beginning of circulation* or its end, as one prefers. The consumption of the use value itself here falls within the economic process, because the use value here is itself determined by exchange value. In no moment of the production process does capital cease to be capital or value to be value, and, as such, *exchange value*. Nothing is more ridiculous than to say, as does Mr Proudhon, that capital changes from a product into an exchange value by means of the act of exchange, i.e. by re-entering simple circulation. [27] We would then be thrown back to the beginning, to direct barter even, where we observe the origin of exchange value out of the product. Already its presupposition as self-preserving exchange value comprises the possibility that capital can and does re-enter into circulation as a commodity at the end of the production process, after its consumption as use value. However, in so far as the product now again becomes commodity, and as commodity, exchange value, and obtains a price and is realized as such in money, to that extent it is a simple commodity, exchange value as such, and, as such, its fate within circulation may be to be realized in money, or it may equally be that it does not realize itself in money; i.e. that its exchange value becomes money or not. Thus its exchange value has become much more problematic – before, it was posited ideally – than the fact that it came into existence. What is more, its being *really* posited as a higher exchange value in circulation cannot originate out of circulation itself, in which, in its simple character, only equivalents are exchanged. Therefore, if it comes out of circulation as a higher exchange value, it must have entered into it as such.

Capital as a form consists not of objects of labour and labour, but rather of *values*, and, still more precisely, of *prices*. The fact that its value-elements have various substances in common during the production process does not affect their character as values; they are not changed thereby. If, out of the form of unrest – of the process – at the end of the process, they again condense themselves into a resting, objective form, in the product, then this, too, is merely a change of the material [*Stoffwechsel*] in relation to value, and does not alter the latter. [28] True, the substances as such have been destroyed, but they have not been made into nothing, but rather into a substance with another form. Earlier, they appeared as elemental, indifferent preconditions of the product. Now they are the product. The value of the product can therefore only = the sum of the values which were materialized in the specific material elements of the process, i.e. raw material, instrument of labour (including the merely instrumental commodities), and labour itself. The raw material has been entirely used up, labour has been entirely used up, the instrument has been only partly used up, hence continues to possess a part of the value of the capital in its specific mode of existence as present prior to the process. This part therefore does not come under view here at all, since it has suffered no modification. The different modes in which the values existed were a pure semblance; value itself formed the constantly self-identical essence within their disappearance. Regarded as a value, the product has in this respect not become *product*, but rather remained identical, unchanged value, which merely exists in a different mode, which is, however, irrelevant to it and which can be exchanged for money. The value of the product is = to the value of the raw material + the value of the part of the instrument of labour which has been destroyed, i.e. transferred to the product, and which is suspended in its original form, + the value of labour. Or, the price of the product is equal to these costs of production, i.e. = to the sum of the prices of the commodities consumed in the production process. That means, in other words, nothing more than that the production process in its material aspect has been irrelevant to value; that value therefore has remained identical with itself and has merely taken on another mode of existence, become materialized in another substance and form. (The form of the substance is irrelevant to the economic form, to value as such.) If capital was originally = to 100 thalers, then afterwards, as before, it remains equal to 100 thalers, although the 100 thalers existed in the production price as 50 thalers of cotton, 40 thalers of wages + 10 thalers of spinning machine, and now exist as cotton yarn to the price of 100 thalers. This reproduction of the 100 thalers is a simple retention of self-equivalence [*Sichselbstgleichbleiben*], except that it is mediated through the material production process. The latter must therefore proceed to the product, for otherwise cotton loses its value, instrument of labour used up for nothing, wages paid in vain. The only stipulation for the self-preservation of value is that the production process really be a total process, i.e. continue to the point where a product exists. The completeness [*Totalität*] of the production process, i.e.

the fact that it proceeds to the product, is here in fact the precondition of the self-preservation, the self-equivalent retention of value; but this is already contained in the first precondition, that capital really becomes use value, a real production process; is therefore *presupposed* at this point. On the other hand, the production process is a production process for capital *only* to the extent that it preserves itself in this process as value, i.e. as product. The statement that the necessary price = the sum of the prices of the costs of production is therefore purely analytical. It is the presupposition of the production of capital itself. First capital is posited as 100 thalers, as simple value; then it is posited in this process as a sum of prices of specific value-elements of itself, elements specified by the price of production itself. The price of capital, its value expressed in money, = the price of its product. That means the value of capital as the result of the production process is the same as it was as the presupposition of the process. However, during the process it does not retain the simplicity it had at the beginning, and which it takes on once again at the end, as the result; rather, it decomposes into the initially quite irrelevant quantitative elements of value of labour (wage), value of the instrument of labour, and value of the raw material. No further relation has been posited, other than that the simple value decomposes quantitatively to form the price of production, as a number of values which recombine in their simplicity in the product, but which exists now as a *sum.* But the sum is = to the original unity. Otherwise, as regards value, and apart from the quantitative subdivision, there is not the least difference in the relation between the distinct amounts of value. The original capital was 100 thalers; the product is 100 thalers, but now 100 thalers as the sum of 50 + 40 + 10 thalers. I could just as well have regarded the original 100 thalers as a sum of 50 + 40 + 10 thalers, but equally as a sum of 60 + 30 + 10 thalers, etc. The fact that they now appear as the sum of specific amounts of units is posited because each of the different material elements into which capital decomposed in the production process represents a part of its value, but a specific part.

It will be seen later that these amounts into which the original unity is decomposed themselves have certain relations with one another, but this does not concern us here yet. In so far as any movement in the value itself is posited during the production process, it is the purely formal one which consists of the following simple act: that value exists first as a unity, a specific amount of units, which are themselves regarded as a unity, a whole: capital in the amount of 100 thalers; secondly, that this unity is divided during the production process into 50 thalers, 40 thalers and 10 thalers, a division which is essential to the extent that material, instrument and labour are required in specific quantities, but which here appears, in regard to the 100 thalers themselves, merely as an irrelevant decomposition of the same unity into different amounts; finally, that the 100 thalers reappear as a sum in the product. The only process, as regards value, [is] that it sometimes appears as a whole, unity; then as a division of this unity into certain amounts; finally, as sum. The 100 thalers which appear at the end as a sum are just as much a sum and in fact exactly the same sum as that which appeared at the outset as a unity. The character of being a sum, of being added up, arose only out of the subdivision which took place in the act of production; but does not exist in the product as such. The statement thus says nothing more than that the price of the product = the price of the costs of production, or that the value of capital = the value of the product, that the value of the capital has preserved itself in the act of production, and now appears as a sum. With this mere identity of capital, or, reproduction of its value throughout the production process, we would have come no further than we were at the beginning. What was there at the outset as presupposition is now there as result, and in unchanged form. It is clear that it is not in fact this to which the economists refer when they speak of the determination of price by the cost of production. Otherwise, a value greater than that originally present could never be created; no greater exchange value, although perhaps a greater use value, which is quite beside the point here. We are dealing with the *use value of capital* as such, not with the use of value of a commodity.

When one says that the cost of production or the necessary price of a commodity is = to 110, then one is calculating in the following way: Original capital = 100 (e.g. raw material = 50; labour = 40; instrument = 10) + 5% interest + 5% profit. Thus the production cost = 110, not = 100; the production cost is thus greater than the cost of production. Now, it is no help at all to flee from exchange value to the use value of the commodity, as some economists love to do. Whether the use value is greater or lesser is not, as such, determined by the exchange value. Commodities often fall beneath their prices of production, although they indisputably have obtained a higher use value than they had in the period *prior* to production. It is equally useless to seek refuge in circulation. I produce at 100, but I sell at 110. 'Profit is not made by exchanging. Had it not existed before, neither could it after that transaction.' (Ramsay, IX, 88.) [29] This signifies the attempt to explain the augmentation of value with the aid of simple circulation, despite the fact that the latter *expressly* posits value as an equivalent only. It is clear even empirically that if everyone sold for 10% too much, this is the same as if they all sold at the cost of production. The surplus value [*Mehrwert*] would then be purely nominal, artificial, a convention, an empty phrase. And, since money is itself a commodity, a product, it also would be sold for 10% too much, i.e. the seller who received 110 thalers would in fact receive only 100. (Consult Ricardo on foreign trade, which he conceives as simple circulation, and says, therefore: 'foreign trade can never increase the amount of exchange value in a country'. (Ricardo, 39, 40.) [30] The grounds he cites for this conclusion are absolutely the same as those which 'prove' that exchange as such, simple circulation, i.e. commerce in general, in so far as it is conceived as such, can never increase *exchange values*, never create *exchange value*.) The statement that the price = the cost of production would otherwise have to read, also: the price of a commodity is always greater than its cost of production. In addition to the simple division and re-addition, the production process also adds the formal element to value, namely that its elements now appear as *production costs*, i.e. precisely that the elements of the production process are not preserved in their material character, but rather as *values*, while the mode of existence which these had *before* the production process is consumed.

It is clear, on another side, that if the act of production is merely the reproduction of the value of capital, then it would have undergone a merely material but not an economic change, and such a simple preservation of its value contradicts its concept [*Begriff*]. True, it would not remain outside circulation, as in the case of autonomous money, but would, rather, take on the form of different commodities; however, it would do so for nothing; this would be a purposeless process, since it would ultimately represent only the same sum of money, and would only have run the risk of suffering some damage in the act of production – [moreover, it is a process] which can fail, and in which money surrenders its immortal form. Well then. The production process is now at an end. The product, too, is realized in money again, and has again taken on the original form of the 100 thalers. But the capitalist has to eat and drink, too; he cannot live from this change into the form of money. Thus, a part of the 100 thalers would have to be exchanged not as capital, but as coin for commodities as use values, and be consumed in this form. The 100 thalers would have become 90, and since he always ultimately reproduces capital in the form of money, more precisely, in the quantity of money with which he began production, at the end the 100 thalers would be eaten up and the capital would have disappeared. But the capitalist is paid for the *labour* of throwing the 100 thalers into the production process as capital, instead of eating them up. But with what is he to be paid? And does not his labour appear as absolutely useless, since capital includes the wage; so that the workers could live from the simple reproduction of the cost of production, which the capitalist cannot do? He would thus appear among the *faux frais de production*. [31] But, whatever his merits may be, reproduction would be possible without him, since, in the production process, the workers only transfer the value which they take out, hence have no need for the entire relation of capital in order to begin it always anew; and secondly, there would then be no fund out of which to pay him what he deserves, since the price of the commodity = the cost of production. But, if his labour were defined as a particular labour alongside and apart from that of the workers, e.g. that of the labour of superintendence etc., [32] then he would, like them, receive a certain wage, would thus fall into the same category as they, and would by no means relate to labour as a capitalist; and he would never get rich, but receive merely an exchange value which he would have to consume via circulation. The existence of capital *vis-à-vis* labour requires that capital in its being-for-itself, the capitalist, should exist and be able to live as *not-worker*. It is equally clear, on the other side, that capital, even as conventionally defined, would not retain its value if it could retain nothing but its *value. The risks of production have to be compensated.* Capital has to preserve itself through the fluctuations of prices. The constantly ongoing devaluation of capital, resulting from the increase in the force of production, has to be compensated, etc. The economists therefore state flatly that if no gain, no profit were to be made, everyone would eat up his money instead of throwing it into production and employing it as capital. In short, if this *not-realization* [*Nichtverwerten*], i.e. the non-multiplication of the value of capital, is presupposed, then what is presupposed is that capital is not a real element of production, that it is not a *specific relation of production*; then a condition is presupposed in which the production costs do not have the form of capital and where capital is not posited as the condition of production.

It is easy to understand how labour can increase use value; the difficulty is, how it can create exchange values greater than those with which it began.

Suppose that the exchange value which capital pays the worker were an exact equivalent for the value which labour creates in the production process. In that case, an increase in the exchange value of the product would be impossible. Everything which labour as such had brought into the production process, in addition to the already present value of the raw material and of the instrument of labour, would have been paid to the worker. In so far as the value of the product is a surplus over and above the value of raw material and instrument, that value would go to the worker; except that the capitalist would pay him this value in his wages, and that the worker pays it back to the capitalist in the product.

***Capital enters the cost of production as capital.* Interest-bearing capital. Proudhon**

<Interest on borrowed capital makes tangible the truth that what is meant by *the cost of production* – even by economists who make this assertion – is not the sum of values which enter into production. For the industrial capitalist, interest is among his direct expenses, his *real* costs of production. But interest itself already presupposes that capital emerges from production as surplus value, since interest is itself only *one form* of this surplus value. Therefore, since, from the standpoint of the borrower, interest already enters into his *direct production costs*, it is apparent that capital enters as such into the cost of production, but that capital as such is not the mere addition of its value-components. – As interest, capital itself appears again in the character of a *commodity*, but a commodity *specifically* distinct from all other commodities; *capital as such* – not as a mere sum of exchange values – enters into

circulation and becomes a *commodity*. Here, the character of the commodity is itself present as an *economic, specific* determinant, not irrelevant as in simple circulation, nor directly related to labour as its opposite, as its use value, as with industrial capital; [but, rather,] capital as it exists in its further aspects, after emerging from circulation and production. The commodity as capital; or capital as *commodity*, is therefore not exchanged for an equivalent in circulation; by entering into circulation, it *obtains its being-for-itself*; it obtains its original relation to its owner, even when it passes into the possession of another. It is therefore merely *loaned*. For its owner, its use value as such is its *realization* [*Verwertung*]; money as money, not as medium of circulation; its *use value as capital*. The demand raised by Mr Proudhon, that capital should not be loaned out and should bear no interest, but should be sold like a commodity for its equivalent, [33] amounts at bottom to no more than the demand that exchange value should never become capital, but always remain simple exchange value; that *capital* should *not exist as capital*. This demand, combined with the other, that wage labour should remain the general basis of production, reveals a happy confusion with regard to the simplest economic concepts. Hence the miserable role he plays in the polemic with Bastiat, about which, later. His chatter about considerations of fairness and right only amounts to this, that he wants to use the relation of property or of law corresponding to simple exchange as the measuring-rod for the relation of property and law at a higher stage of exchange value. Which is why Bastiat himself, unconsciously, stresses those moments of simple circulation which drive in the direction of capital. – Capital itself as commodity is *money as capital* or *capital as money*.>

<The third moment to be developed in the formation of the concept of capital is *original accumulation* [*ursprüngliche Akkumulation*] as against labour, hence the still objectless labour *vis-à-vis* accumulation. The *first moment* took its point of departure from value, as it arose out of and presupposed circulation. This was the *simple concept* of capital; money on the direct path to becoming capital; the *second moment* proceeded from capital as the presupposition and result of production; the *third moment* posits capital as a *specific unity* of circulation and production. (Relation between capital and labour, capitalist and worker itself [posited] as a result of the production

process.) A distinction is to be drawn between the accumulation of capitals, which presupposes capitals, the relation of capital as *present* [*daseiend*], which also presupposes its relations to labour, prices (fixed capital and circulating capital), interest and profit. [34] But in order to come into being, capital presupposes a certain accumulation; which is already contained in the independent antithesis between objectified and living labour; in the independent survival of this antithesis. This accumulation, necessary for capital to come into being, which is therefore already included in its concept as presupposition – as a moment – is to be distinguished essentially from the accumulation of capital which has already become capital, where there must already be *capitals*.>

<We have already seen so far that capital presupposes: (1) the production process in general, such as is common to all social conditions, that is, without historic character, *human*, if you like; (2) *circulation* which is already a specific *historic* product in each of its moments, and even more so in its totality; (3) *capital* as a *specific* unity of the two. Now, the extent to which the production process in general comes to be modified historically as soon as it becomes merely an element of capital has to be found out in the course of developing it; just as the simple conception of the specific characteristics of capital must yield its general historic presuppositions.>

<Everything else is empty chatter. Only at the end, and as a result of the whole development, can it become clear which aspects belong in the first section, ‘Production in General’, and which into the first section of the second section, ‘Exchange Value in General’. We already saw, for example, that the distinction between use value and exchange value belongs within economics itself, and that use value does not lie dead as a simple presupposition, which is what Ricardo makes it do. [35] The chapter on production objectively ends with the product as result; that on circulation begins with the *commodity*, which is itself again a *use value* and an *exchange value* (hence, also, distinct from both, a *value*), circulation as the unity of both – which is, however, merely formal and hence collapses into the commodity as mere object of consumption, extra-economic, and exchange value as independent money.>

Surplus value. Surplus labour time. – Bastiat on wages. Value of

labour. How determined? – Self-realization is self-preservation of capital. Capitalist may not live merely from his labour etc. Conditions for the self-realization of capital. Surplus labour time etc. – To the extent that capital is productive (as creator of surplus labour etc.), this only historic-transitory. – The free blacks in Jamaica. – Wealth which has gained autonomy requires slave labour or wage labour (forced labour in both cases)

The surplus value which capital has at the end of the production process – a surplus value which, as a higher price of the product, is realized only in circulation, but, like all prices, is realized in it by already being ideally *presupposed* to it, determined before they enter into it – signifies, expressed in accord with the general concept of exchange value, that the labour time objectified in the product – or amount of labour (expressed passively, the magnitude of labour appears as an amount of space; but expressed in motion, it is measurable only in time) – is greater than that which was present in the original components of capital. This in turn is possible only if the labour objectified in the price of labour is smaller than the living labour time purchased with it. The labour time objectified in capital appears, as we have seen, [36] as a sum consisting of three parts: (a) the labour time objectified in the raw material; (b) the labour time objectified in the instrument of labour; (c) the labour time objectified in the price of labour. Now, parts (a) and (b) remain unchanged as components of capital; while they may change their form, their modes of material existence, in the process, they remain unchanged as values. Only in (c) does capital exchange one thing for something qualitatively different; a given amount of objectified labour for an amount of living labour. If living labour reproduced only the labour time objectified in the labour price, this also would be merely formal, and, as regards value, the only change which would have taken place would have been that from one mode to another mode of the existence of the same value, just as, in regard to the value of the material of labour and the instrument, only a change of its mode of material existence has taken place. If the capitalist has paid the worker a price = one working day, and the worker's working day adds only one working day to the raw material and the instrument, then the capitalist would merely have exchanged exchange value in one form for exchange value in another. He would not have acted as capital. At the same time, the worker would not have remained within the simple exchange process; he would in fact have obtained the product of his labour in payment, except that the capitalist would have done him the favour of paying him the price of the product in advance of its realization [*Realisation*]. The capitalist would have advanced him credit, and free of charge at that, *pour le roi de Prusse*. [37] *Voilà tout*. No matter that for the worker the exchange between capital and labour, whose result is the price of labour, is a simple exchange; as far as the capitalist is concerned, it has to be a not-exchange. He has to obtain more value than he gives. Looked at from the capitalists' side, the exchange must be only *apparent*; i.e. must belong to an economic category other than exchange, or capital as capital and labour as labour in opposition to it would be impossible. They would be exchanged for one another only as identical exchange values existing in different material modes. – Thus the economists take refuge in this simple process in order to construct a legitimation, an apology for capital by explaining it with the aid of the very process which makes its existence impossible. In order to demonstrate it, they demonstrate it away. You pay me for my labour, you exchange it for its product and deduct from my pay the value of the raw material and instrument which you have furnished. That means we are *partners* who bring different elements into the process of production and exchange according to their values. Thus the product is transformed into money, and the money is divided in such a way that you, the capitalist, obtain the price of your raw material and your instrument, while I, the worker, obtain the price which my labour added to them. The benefit for you is that you now possess raw material and instrument in a form in which they are capable of being consumed (circulated); for me, that my labour has realized itself [*sich verwertet*]. Of course, you would soon be in the situation of having eaten up all your capital in the form of money, whereas I, as worker, would enter into the possession of both.

What the worker exchanges with capital is his labour itself (the capacity of disposing over it); he *divests himself of it* [*entäussert sie*]. What he obtains as price is the *value* of this divestiture [*Entäusserung*]. He exchanges value-positing activity for a predetermined value, regardless of the result of his activity. * Now how is its value determined? By the objectified labour contained in his commodity. This commodity exists in his vitality. In order to maintain this from one day to the next – we are not yet dealing with the working class, i.e. the replacement for wear and tear so that it can maintain itself as a class, since the worker here confronts capital as a *worker*, i.e. as a presupposed perennial subject [*Subjekt*], and not yet as a mortal individual of the working species – he has to consume a certain quantity of food, to replace his used-up blood etc. He receives no more than an equivalent. Thus tomorrow, after the completed exchange – and only after he has formally completed the exchange does he execute it in the process of production – his labouring capacity exists in the same mode as before: he has received an exact equivalent, because the price which he has obtained leaves him in possession of the same exchange value he had before. Capital has paid him the amount of objectified labour contained in his vital forces. Capital has consumed it, and because it did not exist as a thing, but as the capacity of a living being, the worker can, owing to the *specific* nature of his commodity – the specific nature of the life process – resume the exchange anew. Since we are dealing here not with any *particularly* qualified labour but with labour in general, simple labour, we are here not yet concerned with the fact that there is more labour objectified in his immediate existence than is contained in his mere vitality – i.e. the labour time necessary to pay for the products necessary to maintain his vitality – namely the values he has consumed in order to produce a specific *labouring capacity*, a special *skill* – and the value of these shows itself in the costs necessary to produce a similar labouring skill.

[*] One of Mr Bastiat's tremendous profundities is that *wage labour* is an inessential, only formal form, a form of association, which, *as such*, has nothing to do with the economic relation of labour and capital. If, he says, the workers were rich enough to be able to await the completion and sale of the product, then wages, wage labour, would not hinder them from making as advantageous a contract with their capitalist as their capitalist makes with another capitalist. Thus the evil lies not in the wage form, but in conditions independent of it. That these conditions are themselves the *wage condition* naturally does not occur to him. If the workers were capitalists at the same time, then indeed they would relate to non-working capital not as working workers, but as working capitalists – i.e. not in the form of wage-labourers. That is why wages and profit are *essentially* the same for him as *profit* and *interest*. This he calls the *harmony of economic relations*, namely that only *seemingly* economic relations exist, but in fact, in essence, there exists only one relation, that of simple exchange.

> The *essential* forms therefore appear to him as *lacking content*, i.e. not as real forms. [38]
